POUGHKEEPSIE, a city of New York, U.S., on the east bank of the Hudson River, 75 miles north of New York, finely situated on a table-land, about 200 feet above the river. The city has broad and handsome streets, with fine public and private edifices. The collegiate school is situated on an eminence which rises 500 feet above the river, and from which a magnificent prospect, embracing an area 2500 square miles in extent, may be obtained. P. contains a city-hall, academy, law-school, lyceum, orphan asylum, 6 public schools, an endowed female college, a rural cemetery, 6 banks, extensive iron-works; carriage, chair, and carpet factories;

breweries, 21 churches, and has railway and steamboat communication with New York and Albany. P. was settled by the Dutch in 1690; during the Revolution, it was the state capital, and the Convention met here, 1788, to ratify the constitution of the United States. Pop. (1870) 20,080; (1880) 20,607.

POULPE (*Ocotopus*), a genus of *Cephalopoda* (q. v.), of the order *Dibranchiata*; having eight feet or arms, nearly equal, united at the base by a membrane, and very long in proportion to the body. There is no shell, but it is represented by two small grains of horny substance imbedded in the back, one on each side. The arms are used for swimming in water, creeping on land, and seizing prey. Poulpes swim by contractions of the muscular web of the body, which extends upon the arms. They creep on shore in a spider-like manner, with sprawling arms. Like other cephalopods, when alarmed or annoyed, they discharge an inky fluid. One species (*O. vulgaris*) is occasionally found on the British shores, and is more common on the southern shores of Europe, and elsewhere in the Mediterranean. It is the *Polypus* of the ancients. Its arms are six times as long as its body, and each furnished with 120 pairs of suckers. (See *CEPHALOPODA*).—In warmer seas, very large species occur; and although the stories related of their laying hold of and swamping boats, seizing and killing swimmers, &c., may probably be fabulous, yet it is certain that some of them have arms at least two feet long, and there is probable reason to suppose that much larger species exist, which must be powerful and dangerous creatures. A P., with its eyes fixed on its adversary, and its beak threatening to approach, must have a sufficiently formidable aspect. It was no doubt a P. which Mr. Beale encountered on the shore of the Bonin Islands, which he attempted to intercept in its retreat towards the sea, and which turned and fastened upon him, laying hold of him with its arms, and trying to bite him with its parrot-like beak.—See *The Octopus*, by Henry Lee (1875).

POULICE. See *CATAPLASM*.

POULTRY (Fr. *poule*, a hen), a collective name for useful domesticated birds. It is sometimes limited to the domesticated gallinaceous birds, but its ordinary use includes all the birds reared for economical purposes. These belong exclusively to two orders of birds, the *Gallinaceous* and *Palmped*; the common fowl, pea-fowl, Guinea-fowl, turkey, guan, and pigeon belonging to the former; and the different kinds of duck and goose, as well as the swan, to the latter. For what relates to the different species and their varieties, we refer to these heads; devoting this article to some general remarks as to the management of poultry.

In general, the rearing of poultry is regarded as a very subordinate branch of rural economy, and it is pursued chiefly where agriculture is in a somewhat primitive state, the skilful and enterprising farmer deeming it beneath his attention, or finding that he has not time to attend to it, and often looking on the feathered inmates of his farm-yard almost as a nuisance because of their invasions of his fields. It may pretty safely be asserted that there is no good reason for this, and that poultry properly cared for would always be found a source of profit. The farm-yard affords great advantages for the keeping of poultry, and the increasing demand of the market promises a sure return. In some parts of Britain and in Ireland, where the farms are small, poultry are very extensively kept by farmers and cottagers; but the north of France and Pomerania exceed all other parts of Europe in poultry-keeping, which there is not unfrequently the leading object of husbandry, and the traffic in the products of the poultry-yard is on a truly great scale.

There is very commonly no building erected for the special accommodation of poultry; but perches and places for nests are provided for them in a cow-house or some other farm-building; or, in very many cases, when kept by cottagers, they roost on joists of the roof, within the door of the cottage itself. In such cases, they roam at liberty during the whole day, and find much of their food in the fields and on the road sides, although the feeding of them with corn and other food is not neglected by the careful housewife. But it is often undesirable, for the sake of fields or gardens, that so much liberty should be allowed to poultry, and they may be very advantageously kept either wholly or mostly in confinement. If circumstances permit, it is good for them to be let out for an hour or two daily into a grass field, but it is not necessary, if they are provided with a warm, clean, and well-ventilated house, to which a spacious open court is attached, and are regularly supplied with abundance of food, water, sand, or fine ashes, lime, and small stones, all requisites to their healthful existence. The food must also be of various kinds. Poultry must have supplies of grain or pulse, and of soft food made of grain or pulse; the kind may depend upon convenience and cheapness; and instead of such food, boiled potatoes may to some extent be used. Bran is a very good article of food for poultry. But the same food, without variation, should not be given for any considerable time. And it is indispensable that all kinds of poultry be frequently, if not even daily, supplied with green

food, as blades of kale, cabbage, cauliflower, turnips, &c., or lettuces, cresses, chickweed, sow-thistle, &c. It is pretty safe to observe the kinds which they like, and to allow them to choose for themselves. When they have no opportunity of seeking worms, snails, slugs, and insects for themselves, animal food must be given, and the refuse of the kitchen cannot be more profitably employed.

It is possible at some seasons to give too much food, making the poultry too fat, and diminishing the production of eggs; but at other times, as during the season of moulting, food cannot be given too plentifully. Water must at all times be abundantly supplied.

Fig. 1.—Plan of Poultry-House :

aa, the court-yard; bb, for ducks and geese; the apartment for which is also, with laying and hatching-nests; d; e, the roosting-house for hens and turkeys; e, the hatching-house; and f, the apartment for laying.

above it, according to the kind of poultry, and with nests for laying in. Hatching ought to be conducted in a separate place. The court should be furnished with a 'lean to' shed on one side, under which the birds may find shelter from sun or rain, and here they should find sand or fine ashes to fling over themselves, according to their manner, to rid themselves of insect tormentors. Lime is also necessary for them, large quantities of it being used to make egg-shells, besides what the animal system otherwise requires. It may be very conveniently supplied in the form of lime rubbish from old walls, in which also occur in abundance such small stones as birds need in order to the trituration of the food in their gizzard.

In the places appropriated to hatching, it is good to have a fresh turf deposited, to prevent the eggs from becoming too dry, and it is even recommended that the eggs should be slightly moistened every day. It is said that the inner membrane of the egg is otherwise apt to become hard, so that the young chick cannot break through it.

Where purity of breed is of importance, as when fowls are to be exhibited in prize competitions, great care must be taken to

Fig. 2.—Poultry-pen.

keep the different kinds perfectly separate; otherwise, intermixture to a certain extent is not undesirable. It is always, indeed,

to be desired that each good kind be kept pure and in as great perfection as possible, for improvement of the stock. But even in a small poultry-house, it is desirable to have different kinds, some being particularly estimable for their flesh, some for the abundance and quality of their eggs, some for their disposition to incubate, &c. For web-footed birds, free access to water is required; but some of the kinds are well enough provided for by a pretty capacious trough.

Among the diseases of poultry, *Gapes* (q. v.) is one which very frequently demands attention, particularly in young chickens. *Pip* or *Roup* is another. Some of the maladies which cut off great numbers of young chickens, and still more of turkey-pouls, may be in a great measure prevented by supplying abundance of nourishing and sufficiently varied food, with water and lime; and by preventing the young birds, particularly turkeys, from getting among wet grass.

It is sometimes taken for granted by writers on this subject, that all the birds which can be domesticated with advantage, have already been domesticated. The assumption is quite gratuitous, and it might as well be asserted that improvement has reached its utmost in any other direction. The concurrent supposition that the common domesticated kinds were given to man at first as domestic, is likewise unsupported by evidence, although the domestication of some of our poultry birds must be referred to a very early date. Among the *Anatida*, some progress has recently been made in the domestication of new kinds; and a beginning may even be said to have been made as to some additional gallinaceous birds.

Much valuable information on the management of poultry will be found in *The Henwife, Her own Experience in her own Poultry-yard*, by Mrs. Fergusson Blair of Balchayock (Edin. 2d ed. 1861).

POUNCE, powdered rosin, or some gum resin such as mastic, sandarach, or copal, and also the powder of cuttle-fish bones. It is used for sprinkling over freshly-written writing, to prevent blotting; fine sand is often substituted for pounce. Blotting-paper has almost superseded the use of pounce in Great Britain.

POUND, in English Law, means an enclosure, of which there was generally one in every parish, or at least every manor, in which stray cattle were put and detained until the damage done by them was paid for. Whenever a stranger's or neighbor's cattle trespass on another's lands, the latter can seize them, and take them to the pound, or impound them, as it is called, *damage feasant*, and can keep them there till the expenses are repaid. There was a distinction between pound overt, or common pound, and pound covert, or close pound; in the former case, the owner of the beasts could go and feed and water his cattle while impounded, and it was his duty to do so; but not in the latter case. Now, it is compulsory for the impounder, in all cases, to supply the cattle with food, otherwise he incurs a penalty; and if impounded cattle are not sufficiently fed, a stranger who feeds them may not only trespass on lands to do so, but can recover the costs from the owner of the beasts. This was formerly an important head of law, and it is not obsolete, for the power to impound stray cattle still exists, though common pounds are disappearing, for, in point of law, they are not necessary, since the impounder can put the cattle in his own stable or field.

POUND (Sax. *pund*, Ger. *pfund*, Lat. *pondus*, 'weight') the unit of weight in the western and central states of Europe, differing, however, in value in all of them. The symbol (*lb.*), for it is equally general, and is derived from the Latin word *libra*. The old English pound, which is said to have been the standard of weight from the time of William the Conqueror till that of Henry VII., was derived from the weight of 7680 grains of wheat, all taken from the middle of the ear, and well dried. After this time, the *troy* pound, which was heavier by $\frac{1}{16}$ th than the old English pound, became the standard, but it was divided into only 5760 grains. Henry VIII. introduced the *avoirdupois* pound for weighing butcher meat in the market, and it gradually came to be used for all coarse goods in frequent demand; it contained 7000 troy grains. The *troy* and *avoirdupois* pounds, both legal measures, continued in regular use from this period—the former being gradually appropriated by jewelers and apothecaries; and, to prevent variation, a brass weight of one pound *troy* was constructed in 1758, and placed in charge of the clerk of the House of Commons. This weight, in 1824, was declared by act of parliament to be 'the original and genuine standard measure of weight,' and that from which the value of the ounce, grain, pound *avoirdupois*, &c. were to be deduced, but being, along with the standards of measure, destroyed in 1834, a commission was appointed to consider the best means of replacing them.

After long deliberation, hearing of evidence, and sifting of suggestions, it was agreed, *inter alia*, that the standard of weight should be a piece of platinum, weighing 7000 grains (an *avoirdupois* pound), but that this piece should not be defined with reference to any natural standard. The *troy* pound thus ceased to be

the standard, but its use was allowed to jewelers and (differently divided and subdivided) to apothecaries. In the British Pharmacopoeia of 1864, the *troy* ounce of 480 grains was given up, and the pound *avoirdupois* of 7000 grains, and the ounce *avoirdupois* of 437½ grains, were adopted. The Weights and Measures Consolidation Act of 1878 adhered to the platinum standard pound.

The pound-weight of silver, a common money standard among the ancient Romans, was introduced by them into the countries they conquered, and thus the term 'pound' became a designation of a certain amount of coined money. Thus, now-a-days, the English pound is considered as something (a coin or otherwise) equivalent to 20 shillings, but originally it denoted the pound of silver which was coined into 20 shillings. From Edward II.'s time, the coins were more and more diminished in size, that monarch coining 25 shillings from a pound of silver; while from the same weight of bullion his various successors coined 30, 45, 48, 96, 144, 288, in the time of Elizabeth 60, and (during the reigns of her successors) 62 shillings. George I. coined 66 shillings to the pound of silver, and this rate still continues, the term 'pound' having been completely severed from its original meaning, and appropriated to signify 20 shillings of the present coinage.

POUSSIN, NICOLAS, a painter of great celebrity, born near Le Grand-Andely, in Normandy, in 1598 or 1594, was first a pupil of Quintin Varin, then painting pictures for the church of Grand-Andely, but at the age of 18 went to Paris, studied under Ferdinand Elle, the Fleming, Lallemand, and others; but chiefly improved himself by drawing from casts, and drawings and prints after Raphael and Julio Romano, in the collection of M. Courtois, who accorded him access to them. After a long and hard struggle, he attained the object of his desire—namely, the means of visiting Rome. He was 30 years of age when he arrived there, and a considerable period elapsed after that before he obtained much employment. At length, however, he received several important commissions from the Cardinal Barberini, which he executed so successfully, that he afterwards rapidly acquired fame and fortune. After an absence of sixteen years, he returned to Paris with M. de Chantelou, and was introduced by Cardinal Richelieu to Louis XIII., who appointed him his painter in ordinary, with apartments in the Tuileries, and a salary of £120 a year. P. returned to Rome for the purpose of giving up his establishment there, and taking his wife to Paris; but, while he was occupied with these arrangements, Louis XIII. having died, he gave up all thoughts of returning to his native country, remained in Rome, and after a very successful career, died in 1665. His reputation mainly rests on his success in aiming at the classic style. Sir Joshua Reynolds says: 'No works of any modern have so much the air of antique painting as those of Poussin.' Many prefer his landscapes, or those pictures of his in which the landscape predominates, to his compositions in which his attention has been bestowed chiefly on the figures. Upwards of 200 prints have been engraved from his works. The National Gallery has several of P.'s pictures, two of which are particularly praised, 'A Bacchanalian Dance,' and 'A Bacchanalian Festival.'

POUSSIN, GASPARE, a celebrated landscape painter, was the son of a Frenchman, settled in Rome, and was born there in 1613. He was the pupil of Nicolas Poussin, who had married his sister, and from respect to that great artist, adopted his name in place of his own, which was Dughet. He was called by the Italians Gaspard Duche, and he inscribed his etchings, eight in number, in that way. His landscapes are composed in general from studies in the Campagna of Rome and surrounding country, worked out with the feeling of a mind deeply imbued with classical associations, and tending towards melancholy reflection, by contrasting the glory of the past with the decadence of the present—ideas entirely the opposite of those of Claude, who, trusting to the never-fading beauty of nature, endeavored, from the scenery and architectural remains in Italy, to realize the classic age in all its glory. The National Gallery possesses six specimens of P., some of them being reckoned masterpieces, as the 'Sacrifice of Isaac,' a 'Land Storm,' and an 'Italian Landscape with a View of a Town.' P. died in Rome 1675.

POW'AN (*Oreogonus* [q. v.] *Cepedei*), a fish found in Loch Lomond, Scotland, and often called *Freshwater Herring*. It is not found in any other British lake or river, and has not yet been identified with any fish of the continent of Europe, although probably it is to be found in some of the Scandinavian lakes. It resembles the Pollan (q. v.) of the Irish lakes, but is readily distinguished. The P. sometimes attains the length of sixteen inches. Great shoals are seen in Loch Lomond, rippling the surface of the water, and approaching the shores in the mornings and evenings. They are never seen in the middle of the day. The P. is highly esteemed for the table; and is in best condition in August and September. It is generally caught by nets.

POWDERED, or SEMÉE, in Heraldry, strewn with an indefinite number of small charges.

POWELL, THE REV. BADEN, an eminent English savant, son of a London merchant, was born at Stamford Hill, near London, 22d August 1796, and studied at Oriel College, Oxford, where he graduated M.A., with first-class mathematical honors in 1817. P. took holy orders in 1820, and was appointed vicar of Plumstead, in Kent, in 1821. In 1824, he was elected a Fellow of the Royal Society; and three years later, was appointed Savilian Professor of Geometry, a chair which he held till his death, which took place in London, June 11, 1860. As a professor, his great aim was to bring about a larger recognition of the importance of physical and mathematical science, in the curriculum of learned study at Oxford, and his efforts have not been altogether in vain. To the 'Philosophical Transactions,' the 'Reports' of the British Association, and other vehicles of scientific instruction, he contributed numerous valuable papers; but is perhaps best known by his strenuous exertions to obtain for modern science the right of modifying the views of nature and the origin of the world, expounded or thought to be expounded in the Jewish Scriptures. In this perilous department of controversy P. displayed great learning, logical power, moderation of tone, and philosophic urbanity; but his conclusions were too unmistakably rationalistic to be palatable to the orthodox.

Among his works may be mentioned *A Short Elementary Treatise on Experimental and Mathematical Optics, Designed for the Use of Students* (Oxford, 1833); *Revelation and Science* (Oxford, 1833); *A Historical View of the Progress of the Physical and Mathematical Sciences* (Lond. 1834); *The Connection of Natural and Divine Truth* (Lond. 1838); *Tradition Unveiled; a Candid Inquiry into the Tendency of the Doctrines advocated in the Oxford Tracts; A General and Elementary View of the Undulatory Theory as applied to the Dispersion of Light, &c.* (Lond. 1841); *Essays on the Spirit of the Inductive Philosophy, &c.* (Lond. 1855); *Christianity without Judaism* (1857); *The Order of Nature considered with Reference to the Claims of Revelation* (1859); and *On the Study and Evidences of Christianity in Essays and Reviews* (1860).

POWER, in point of law, means an authority given to some person who would otherwise not be entitled to do the specific thing empowered. Thus an authority given to an agent to act for another is called a power of attorney; and there are numerous examples of powers contained in marriage settlements, wills, and miscellaneous deeds, which authorize one of the parties to do something in certain contingencies. Thus a power of revocation is often reserved to a party to revoke a will or deed. There is a power of appointment given to a married woman or widow to bequeath or divide certain property in certain events among her children. So a power to charge or jointure an estate, and to secure the portions of children. There are many nice and difficult rules of law applicable to matters connected with and arising out of powers. A power is created by a deed or will: and it is said to be executed when it is carried out. In Scotland, powers are generally called *Faculties* (q. v.).

POWERS, HIRAM, American sculptor, son of a farmer, and the eighth of nine children, was born at Woodstock, Vermont, July 29, 1805, and acquired the rudiments of education at a free district-school. While still a boy, he went to Cincinnati, Ohio, where he became an apprentice to a clockmaker, and about the same time formed the acquaintance of a German sculptor, who taught him to model in plaster. Subsequently, he was employed for several years making wax-figures and fitting them with machinery, for the Cincinnati museum, where his 'Infernal Regions' horrified thousands of visitors. In 1835, he went to Washington, where he executed the busts of several distinguished persons; and, with the aid of Mr. Nicholas Longworth, in 1837 went to Italy to study his art, residing in Florence till his death. In 1838, he produced his statue of 'Eve,' which excited the admiration of Thorwaldson; and in 1839, the still more popular 'Greek Slave,' of which six copies in marble, with cast copies innumerable, were produced. Of his 'Fisher Boy,' three copies were ordered. Among his other works the chief were 'Proserpine,' 'Il Penseroso,' 'California,' 'America' (the last for the Crystal Palace, Sydenham); statues of Washington for the state of Louisiana, of Calhoun for South Carolina, and Webster for Boston; and busts of Adams, Jackson, Marshall, Van Buren, and other distinguished Americans. He died June 27, 1873.

POYNTELL, pavement or tiles laid in small lozenge form.

POZZO DI BORGO, CARLO ANDREA, a celebrated Russian diplomatist, was born at Alala in Corsica, March 8th, 1768, and was educated at the university of Pisa. Returning to Corsica, he adopted the profession of advocate, in which he soon became distinguished for his activeness, ingenuity, and brilliant eloquence; and about this time an intimacy sprung up between him and the two young Bonapartes, Napoleon (I.) and Joseph. P.'s great ability soon gained for him the esteem of Paoli (q. v.), who made him the confidant of his plans, to the intense disgust of the Bonaparte family, who considered themselves slighted. A coolness in consequence sprung up between P. and young Napoleon, which, as

their paths in life diverged more and more, passed through the various grades of antagonism, dislike, distrust, and hatred, till, when the latter swayed the sceptre of France, and the former became the supreme trusted adviser of Russia and Austria, it culminated in a deadly struggle for victory between the diplomatist and the warrior, to be ended only by the death of one or the destruction of his power. P. represented Corsica in the French National Assembly (1791—1792); but his party, that which wished to unite liberty and hereditary rule, being overpowered by their 'radical' opponents, he was compelled to return to Corsica, where he again attached himself to Paoli's party; and on the failure of that chief's plans, retired to London. Here he became the agent of the French refugees; and in 1798, having now thoroughly broken with the Bonapartes, he went to Vienna to promote an alliance of Austria and Russia against France, and accompanied the Russian army in the subsequent campaign of 1799.

In 1803, he entered the Russian service as a councillor of state, from this time devoting his whole attention to diplomacy. He was at the bottom of the Russo-Austrian alliance, which was dissolved by the battle of Austerlitz (1805); but after the treaty of Tilsit, fearing lest Napoleon might insist upon his surrender, he retired to Austria, from which country Napoleon, in 1809, demanded his extradition. The Emperor Francis refused, but P., to save trouble, retired to England (1810), where he staid for some time; and then returned to Russia. He soon after induced the Emperor Alexander to make certain custom-house regulations which offended Napoleon, and were a chief cause of the rupture which resulted in the campaign of 1812; he also suggested to the emperor, and effected the seduction of Murat, Bernadotte, and Moreau from the Napoleonic cause; and after the victorious allies had driven Napoleon across the Rhine, P., at the congress of Frankfurt-on-the-Main, drew up his famous declaration, 'that the allies made war not on France, but on Napoleon.' From this time, his whole energies were devoted to the task of keeping Alexander inflexible with regard to Napoleon's seductive offers of accommodation; but after his old antagonist's downfall, he exerted himself with equal vigor at Paris (where he signed the treaty of 1815 as Russian ambassador) and Aix-la-Chapelle (1818) to ameliorate, as much as possible, the hard conditions imposed upon France. After the accession of the Emperor Nicholas, he was, though highly esteemed, less confided in, and accordingly accepted the post of Russian ambassador in London; but retired from public life in 1839, and settled in Paris, where he died 15th February 1842.

POZZUO'LI, a city of Southern Italy, at the east of the bay of Naples, in the province of Naples, with 16,763 inhabitants; has manufactures of soap. But the interest which attaches to it is drawn from its numerous memorials of classic ages. Its cathedral was the Temple of Augustus. There is the Temple of Serapis, an Egyptian god, who was invoked by the priests to render the mineral waters of the place efficacious as remedies. The interior of the temple had a portico of 24 pillars, surrounded by 70 chambers for the sick and for the priests. In the harbor there may still be seen 13 pillars, which formerly supported as many arcades, under which the inhabitants used to congregate to watch for the vessels coming from Africa. There is an arch erected to Antoninus Pius, for having restored 20 of those pillars. There are the remains of an amphitheater which might have contained 25,000 spectators. The Solfatara (*Forum Vulcani*) is a half-extinct volcano near P., from which springs saline water, used as a remedy for cutaneous diseases. Near the Montenuovo there is the famous Lago d'Averno, enclosed among hills; and at a short distance from it there is the Sibyl's Cave (*La Grotta della Sibilla*), which, however, is nothing more than the remains of a subterranean passage leading, perhaps, to Baja. On a plain there is an extinct volcano; there Cumæ once stood, now all in ruins. In the environs of P. are to be seen the promontory of Posilipo, the Elysian Fields (*Campi Elici*) near the harbor of Miseno, and the Lake of Agnano, formerly the crater of a volcano.

P. was probably built by the Cumani (Greek colonists of Cumæ), who gave to its gulf the name of *Cumanius*. They called the new port *De Caarchia*, a name which was afterwards changed to *Puteoli*, in allusion perhaps to the sulphur wells or springs (*putei*) with which it abounded. Puteoli is first mentioned in history during the Second Punic War, when, by order of the senate, it was surrounded by strong walls. In 214 B. C. it repulsed Hannibal, and from this period rose in importance until, towards the close of the republic, it became virtually the port of Rome, and during the empire was really the first emporium of commerce in Italy. Puteoli was destroyed by Alaric, Genseric, and Totila, and though rebuilt by the Byzantine Greeks, it was exposed to new devastations, to earthquakes, and volcanic eruptions, and soon sank into the decay which continues to mark it.

PRACTICE, in Arithmetic, is the name given to a method, or rather a system of expedients, for shortening or avoiding the

operation of compound multiplication. The nature of the expedients will be best understood by an example: Suppose that the price of 64,875 articles at £2, 17s. 6d. is required. It is obvious that the price, at £1, would be £64,875; therefore, at £2, it is £129,750; at 10s., it is the half of that at £1, viz., £82,437, 10s.; at 5s., the half of this last sum, or £41,218, 15s.; and at 2s. 6d., the half of this, or £20,609, 7s. 6d. The sum of these partial prices gives the whole price—thus

£	s.	d.		£	s.	d.
Price at	2	0	0	129750	0	0
" "	0	10	0 (= $\frac{1}{2}$ of £1),	32437	10	0
" "	0	5	0 (= $\frac{1}{4}$ of 10s.),	16218	15	0
" "	0	2	6 (= $\frac{1}{2}$ of 5s.),	8109	7	6
" "	2	17	6	186515	12	6

The general principle of the method is to decompose the lower denominations of the compound factor into *aliquot parts* of the higher unit. A still simpler way with the above example is the following:

£	s.	d.		£	s.	d.
Price at	3	0	0	194635	0	0
" "	0	2	6 (= $\frac{1}{4}$ of £1)	8109	7	6
" "	2	17	6	186515	12	6

PRÆFECT, a common name applicable to various Roman functionaries. The most important was the *Præfectus urbi*, or warden of the city, whose office existed at an early period of Roman history, but was revived under Augustus, with new and greatly altered and extended authority, including the whole powers necessary for the maintenance of peace and order in the city, and an extensive jurisdiction civil and criminal. The *Præfectus prætorio* was the commander of the troops that guarded the emperor's person.

PRÆMUNI'É, the name given in English Law, to a species of offence of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire* or *præmonere facias*) of a writ originally introduced for the purpose of repressing papal encroachments on the power of the crown. The first statute of præmunire was passed in the reign of Edward I. The attacks of the popes on the rights of private patrons, by bestowing bishoprics, abacies, &c., on favorites before they were void, were the immediate cause of various subsequent statutes of præmunire, which made it penal to endeavor to enforce the authority of papal bulls and provisions in England. By later statutes, a number of offences of a miscellaneous description have been rendered liable to the penalties of a præmunire, as (by 6 Anne c. 7) the asserting by preaching, teaching or advicely speaking, that any person, other than according to the Acts of Settlement and Union, has any right to the throne of these kingdoms, or that the sovereign and parliament cannot make laws to limit the descent of the crown. The knowingly and wilfully solemnizing, assisting, or being present at any marriage forbidden by the Royal Marriage Act, is declared by 12 Geo. III. c. 11 to infer a præmunire.

PRÆNESTÉ. See **PALESTRINA**.

PRÆTOR (probably a contraction for *prætor*, from *pra-*so, to precede, also to order) was, among the ancient Romans, the title given to the consuls as leaders of the armies of the state; but it was specially employed to designate a magistrate whose powers were scarcely inferior to those of a consul. The prætorship, in this specific sense of the term, was first instituted in 366 B.C., as a compensation to the patricians for being obliged to share with the plebeians the honors of consulship. It was virtually a third consulship; the prætor was entitled *collega consulibus*; he was elected by the same auspices and at the same comitia. For nearly 30 years, patricians alone were eligible for the office; but, in 337 B.C., the plebeians made good their right to it also. The prætor's functions were chiefly judicial. Though he sometimes commanded armies, and, in the absence of the consuls, exercised consular authority within the city, yet his principal business was the administration of justice both in matters civil and criminal; and 'to the edicts of successive prætors,' says Mr. G. Long, 'the Roman law owes, in a great degree, its development and improvement.' Originally, there was only one prætor; but as the city and state increased, and their relations with other nations became more complicated, others were added. In 246 B.C., a second prætor was appointed, to settle disputes that might arise between Romans and foreigners temporarily resident in Rome, for trading or other purposes, hence called *prætor peregrinus* (foreign prætor), to distinguish him from the original *prætor urbanus* (city prætor). In 227 B.C., two new prætors were appointed, to administrate affairs in Sicily and Sardinia; and in 197 B.C., two more for the Spanish provinces, or six in all. Sulla increased the number to eight, and Julius Cæsar to sixteen.

Augustus reduced the number to twelve; but at a later period we read of eighteen, if not more. The city-prætorships were reckoned the highest; and after a person had filled these offices, he sometimes received the administration of a province with the title of *proprætor* or *proconsul*.

PRÆTORIAN BANDS (Lat. *Prætoria Cohortes*, and *Prætoriani*) the name given, more particularly during the period of the Roman empire, to a body of soldiers, organized for the purpose of protecting the person and maintaining the power of the emperors. We indeed read of a *prætoria cohors*, or select guard of the most valiant soldiers attached to the person of Scipio Africanus, who, according to Festus, received six-fold pay, and the exigencies of the civil wars naturally increased their number, but it was to Augustus that the institution of them as a separate force is owing. He formed nine or ten cohorts, each consisting of a thousand men (horse and foot), but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased their number to sixteen. The Prætorians served at first for twelve, and afterwards for sixteen years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favor by liberal donations. The Prætorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and careless how they got them.

After the death of Pertinax (193 A.D.), they actually sold 'the purple' for a sum of money to Didius Julianus; but in the same year their peculiar organization was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes, they were entirely abolished by Constantine (312 A.D.), who dispersed them among his regular legions.

PRA'GA. See **WARSAW**.

PRAGMA'TIC SANCTION, or **RESCRIPT**, a solemn ordinance or decree of the head of a legislature relating either to church or state affairs. The term originated in the Byzantine empire, and signified a public and solemn decree by a prince, as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. This name is given to several important treaties, of which the principal are: 1. An ordinance of Charles VII. of France, in which the rights of the Gallican Church were asserted in opposition to the usurpation of the pope in the appointment of bishops. Twenty years later, Louis XI., in order to please Pope Pius II., was induced to give up this P. S., which was ignominiously dragged through the streets of Rome; but at a subsequent date, a quarrel having arisen between Louis and the Pope, the P. S. was re-enacted. 2. The instrument which settled the empire of Germany in the House of Austria (1439 A.D.). 3. The ordinance by which Charles VI., Emperor of Germany, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States General, and most of the European powers. 4. The settlement of the succession of the kingdom of Naples, which was ceded by Charles II. of Spain, in 1759, to his third son and his descendants.

PRAGUE (Ger. *Prag*, Slav. *Praha*), capital of the kingdom of Bohemia, is situated in 50° 5' N. lat., and 14° 30' E. long., on the slope of the hills which skirt both sides of the river Moldau, 251 miles north-east of Vienna by railway. Pop. in 1880, 218,077. P., which ranks as the third city of Austria, presents a highly picturesque appearance from the beauty of its site, and the numerous lofty towers (upwards of 70 in number) which rise above the many noble palaces, public buildings, and bridges of the city. It consists of four principal parts: 1. The Kleinseite, chiefly occupied by the public offices, and the residences of the officials; 2. The Hradschin (or palace district), surmounted by the vast imperial castle, and containing some of the most ancient and interesting churches and palaces of P.; 3. The Jews' Quarter, now known as the Josephstadt, which forms the chief business-quarter and contains numerous churches, ecclesiastical and educational establishments; 4. The 'New Town,' containing the largest number of streets and open squares, with many modern palaces, charitable institutions, and places of public resort. P. is surrounded by walls and bastions, and has eight gates. The citadel, the ancient residence of the old dukes of Bohemia, is well fortified, and from its elevated position above the Moldau, thoroughly

commands the city. P. has 55 Catholic, and 3 Protestant churches, 15 monasteries, and 10 synagogues.

Among the most noteworthy of these are the Metropolitan, or St. Veits, with its lofty tower, a fine but unfinished specimen of the Gothic of the 14th c., containing the remains of St. Ludmilla, first duchess of Bohemia, and of seven kings and emperors of Germany, with the grave of St. Wenzlaus, and the silver sarcophagus of St. Nepomuk (see ST. JOHN OF NEPOMUK), a popular saint of Bohemia; St. Nicolas, or the church of the Jesuits, with its many towers and costly decorations; the Thein Church, built in 1407; the old Hussite church, with the grave of Tycho Brahe, and its marble monuments of the Slavonic martyrs, Cyril and Methodius. Among the numerous public and other buildings of note in P., the following are some of the more interesting: the Royal Palace, the Cathedral, the Theresa Institution for Ladies, the ancient Byzantine church of St. George, the Hradschin Square, with the imposing palaces of the primate, the ex-emperor, and Prince Schwarzenberg; the Loretto Chapel, with its gorgeously jewelled church vessels; the vast Czerni Palace, now used as an institution of charity; the Picture Gallery; the Premonstratentian monastery of Strahow; the royal library; and at the summit of the Laurenzberg, the restored Church of St. Lawrence. P. has, however, numerous public gardens and walks in the suburbs, which, with the several royal and noble parks open to the public in the vicinity of the city, afford varied resources for health and open air recreations.

The suburb of Karolinenthal, which is traversed by the great viaduct of the railway, and is of modern growth, has some fine buildings, numerous gardens, barracks, and manufacturing establishments; and somewhat further north is the great botanical garden, with the neighboring public walks on the Moldau. The university, one of the most ancient in Europe, having been founded in 1348, enjoyed the greatest celebrity in the 15th c., when many thousand scholars came from foreign countries to study in its halls; but subsequently it had a long period of decay. It received a new constitution in 1881, having now two co-ordinate sides or sections, one German and one Czech; a library of 142,000 volumes, and 7762 manuscripts; a fine observatory; museums of zoology and anatomy; a botanical garden, &c. P. has also 1 Polytechnic, 3 gymnasia, Bohemian and German training schools, and about 20 parish schools. The manufactures include leather, cotton, and linen goods, stockings, printed cottons, machinery of various kinds, beet-root sugar, &c. P. is the great center of the commerce of Bohemia, and the seat of an important transit trade.

History.—According to popular tradition, P. was founded in 722 by the Duchess Libussa. In the 13th c., its importance was fully recognized; in the 14th and 15th centuries, its munificently endowed university brought foreigners to it from every part, until the decision of the Emperor Wenzlaus to favor Bohemian students more than others drove thousands of the scholars with their professors to other spots, and led to the foundation of universities at Leipsig, Ingolstadt, Rostock, and Cracow. In 1424, P. was conquered, and almost destroyed by the Hussites, who had made a successful stand against the emperor Sigismund's army; but after the subsequent defeat and submission of the insurgents, the city was rebuilt. In the Thirty Years' War, it suffered severely, and in 1620 the battle was fought at the White Mountain, near the city, in which the Elector-Palatine, Frederick V., known as the Winter King, and son-in-law of James I. of England, was completely defeated, and compelled to renounce his assumed crown, and to give up the town into the power of the emperor. Swedes and Imperialists successively gained possession of it during the war; and a century later, during the Seven Years' War, it again fell into the hands of different victors, having been compelled, in 1744, to capitulate to Frederick the Great of Prussia; and until the war of deliverance in Germany, and the downfall of Napoleon, the city continued to suffer more or less directly from the troubles in which the house of Austria had been involved. During the last sixty years, it has, however, made rapid strides, and enjoyed prosperity and quiet, except in 1848, when the meeting of the Slavonic Congress within its walls called forth such strongly marked democratic demonstrations on the part of the supporters of Pan Slavism (q. v.), that the Austrian government dissolved the convocation, and restored quiet by the summary method of causing the old and new town to be bombarded for two days.

PRAIA GRANDE. See RIO DE JANEIRO, PROVINCE.

PRAIRIE (Fr. meadow) was the name given by the early French explorers of the northern portion of the Mississippi Valley, North America, to the vast fertile plains which extend from Western Ohio and Southern Michigan, across the states of Indiana, Illinois, Missouri, Arkansas, Iowa, Kansas, and Nebraska and Dakota Territories, including the southern portions of Wisconsin and Minnesota. These great plains or savannas are sometimes flat, but oftener rolling like the long swells of the ocean, and rise in gradual elevation from 300 to 1500 feet above the level of the sea.

They are drained by numerous rivers, branches of the Ohio, Mississippi, and Missouri, or emptying into Lake Michigan, whose channels seem to have been worn to the depth of 50 to 300 feet, with vertical walls or bluffs of limestone, sandstone, displaying in some places banks of clay, sand, and loam, 200 feet in thickness. Beneath the prairies north-west of the Ohio are extensive coal-fields, with deposits of iron, lead, &c. The soil is finely comminuted, rich, and extremely fertile, varying in thickness from one or two feet, to the bottom-lands on the borders of the rivers, which are of great depth and inexhaustible fertility. These plains are destitute of trees, except in isolated groves, a few rocky ridges, and the borders of streams. They are covered with fine grasses, and brilliant flowers of various species of the helianthoid *Compositae*. Water is found from 15 to 80 feet below the surface. These great prairies, covering an area of about 400,000 square miles, formerly fed vast herds of buffalo, deer, wild turkeys, prairie-hens or grouse, prairie-dog, squirrel, &c. In the autumn, the dried grasses, fired by the Indians, converted them into seas of flame. The lack of timber is attributed by some to the fineness of the soil.

Remains of ancient mounds, fortifications, and cities show that they were, at some distant period, inhabited by a more civilized race than the Indians found by European discoverers. These great rolling plains, or natural pastures, with only the labor of ploughing, produce large crops of wheat and maize, and, penetrated by navigable rivers, and crossed by cheaply built railways, they form one of the most easily cultivated and prolific regions of the world, and are capable of sustaining immense populations.

PRAIRIE DOG (*Arctomys Ludovicianus*), a very interesting species of Marmot (q. v.), an inhabitant of some of the western Prairies (q. v.) of North America. It is about the size of a squirrel or large rat; and has soft, reddish-gray fur, each hair being red, with a white tip. The name P. D. seems to have been given

Prairie Dog (*Arctomys Ludovicianus*).

to it from its frequent utterance of a sound somewhat like the bark of a very young puppy. For the same reason, it is also called the Barking Squirrel. A more correct name would be Barking Marmot, or Prairie Marmot. The P. D. does not inhabit the rich grass-covered prairies where the buffalo (bison) abounds; but those which, from want of water, exhibit a comparatively scanty vegetation; and in these it is to be found in vast numbers, being gregarious in its habits, burrowing in the ground, and throwing up mounds of earth, on the summit of which the little creature often sits as if on watch. The whole extent of a great level prairie is often covered with these hillocks. 'Their number is incredible,' says the Honorable C. A. Murray, in his *Travels in North America*, 'and their cities, for they deserve no less a name, full of activity and bustle.'

As soon as the hand is raised to a weapon or missile, they pop into their holes with amazing rapidity, and then wheel round and look out at the enemy. Still more interesting is the frequent association of the P. D. with the burrowing owl and the rattlesnake in the same burrow; an association which has been variously described as one of strange friendship among very different creatures, in a state of nature; and as of the most opposite character, the owl and the rattlesnake being supposed to prey upon the P. D. and its young. But in so far as the owl is concerned, this is rendered very doubtful by the fact, that its *casts* seems to show its food to consist entirely of insects. It probably finds the burrows of the marmot its only convenient retreat, and their proper inmates harmless neighbors.

PRAIRIE-DU-CHIEN, a town of the state of Wisconsin, U. S. on the right bank of the Mississippi, three miles above the mouth of the Wisconsin, and 165 miles west from Milwaukee. It is a prosperous and rapidly-increasing town, and in its neighborhood are rich copper-mines. Pop. (1870) 2700.

PRAIRIE HEN. See GROUSE.

PRAJAPATI (from *prāja*, creation, created beings; and *pati*, lord) is, in Hindu Mythology, a name of the god Brahmā, but also a name of those divine personages who, produced by Brahmā, created all existing beings, inclusive of gods, demons, and natural phenomena. Manu knows of ten such *Prajāpatīs* engendered, through pure meditation, by the god Brahmā—viz., Marīchi, Atri, Angiras, Pulastya, Pulaha, Kratu, Parchetas or Dakṣha, Vasishṭha, Bhṛīgu, and Nārada. The Mahābhārata, however, leaves out Dakṣha, Bhṛīgu, and Nārada; and other varieties occur in the different Purāṇas. Whereas, also, these 'lords of creation,' in conformity with Manu, are in some of these works looked upon as the mind-born sons of Brahmā, some Purāṇas as derive them from different parts of Brahmā's body. The only interesting point in this theory of the *Prajāpatīs* is the assumption, that the world did not immediately proceed from Brahmā, the highest god, but through the intermediate agency of beings which thus stand between him and creation.

PRAJNA PARAMITA (literally, the wisdom which has gone to the other shore, viz., of its object; i. e., absolute or transcendental wisdom, from the Sanscrit *prajñā*, wisdom, *pāram*, to the other shore, and *itā*, gone) is the title of the principal Sūtra (q. v.) of the Mahāyāna school of the Buddhists (see **BUDDHISM**). Its main object is metaphysical; but the commencement of the work is merely a eulogy of Buddha; and of the Bodhisattvas, who form his retinue. Other parts of it contain incidental narratives of wonderful phenomena connected with the apparition of Buddhist saints, or a description of the benefits arising from an observance of the Buddhist doctrine, or verses in which the Buddha is praised by his disciples, and similar irrelevant matter. It is probably on account of the extent which could easily be imparted to such episodic topics, but also by amplifying the real substance of the work, that several recensions of the P. are in existence, both with the Buddhists and Tibetans (see **LAMATISM**); some of these do not contain more than 7000 or 8000 or 10,000 s'lokas, or paragraphs; but others amount to 18,000, 25,000, or 100,000 s'lokas. The following may serve as a specimen of the abstruse ideas treated of in this great work of the Buddhist doctrine. No object has existence or non-existence; nothing belongs to eternity or non-eternity, to pain or pleasure, to vacuity or non-vacuity.

All objects are without attributes and with attributes, with and without characteristic marks. Bodhisattva (the name for a deified saint) and Prajñā (wisdom) are synonymous terms; such a term neither rises nor perishes; it exists neither inwardly nor outwardly, because it cannot be seized; but the Bodhisattva must accomplish his career under this fallacious name; it is his duty, however, to look neither upon form nor anything else as an eternal or non-eternal, as a pure or impure matter, &c. Then only when he is in a condition of complete indifference regarding everything, is he capable of encompassing the whole wisdom. . . . The absence of nature is the nature of everything; all objects are separated from their characteristics. All objects neither appear nor are born, nor disappear, nor cease to be, nor are they pure nor impure, nor are they acquirable nor non-acquirable. Want of understanding is the not understanding that objects are nonentities. From the want of understanding proceed all subjective notions; and through the latter one becomes incapacitated from fulfilling the behests of the sacred doctrine, and from entering the path which leads to wisdom. . . . Everything is like the echo, or a shadow, or anything else without substance. In short, the doctrine of the P. is the entire negation of the subject as well as the object; and whatever be the difference in detail between the points of view from which it looks upon subject or object, or between its comparisons and circumlocutions, the result is always the same: that the object of ascertainment, or the highest wisdom, has no more real existence than the subject striving to attain to it, or the Bodhisattva.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

PRĀKR'IT (from the Sanscrit *prakr'iti*, nature; hence, natural, not accomplished, vulgar) is the collective name of those languages or dialects which are immediately derived from, or stand in an immediate relation to Sanscrit, or 'the accomplished' Language (q. v.) of the Hindus. These languages, however, must not be confounded with those modern languages of India which also have an affinity with the Sanscrit language; for, in the *Prākṛit* languages, however much they may differ from Sanscrit in their phonetic laws, the words and grammatical forms are immediately derived from that language; whereas, in the modern tongues of India, there is not only no connection between their phonetic laws and those of Sanscrit, but their grammatical forms also are wholly different from those of the ancient language; and while many of their words have no Sanscrit origin, even those which have, show that they are not immediately drawn from that source. The *Prākṛit* languages comprise, besides the *Pālī* (q. v.),

which generally, however, is not included amongst them, those dialects which are found in the dramas and in the oldest inscriptions. In the dramas, it is women, except female religious characters, and subordinate male personages, who are made to speak in these languages—the use of Sanscrit being reserved for the higher characters of the play—and amongst the former, again, the choice of the special *Prākṛit* dialect is adapted by the poet to the rank which such a subordinate personage holds, the more refined dialect being appropriated, for instance, to the wives of the king or hero of the play; an inferior *Prākṛit* to his ministers; others less in degree to the sons of the ministers, soldiers, town-people, and the like; down to the lowest *Prākṛit*, which is spoken only by servants, or the lowest classes.

A work on the poetical art, the *Sāhityadārpan'a*, enumerates 14 such *Prākṛit* dialects—viz., the *S'aurasenī*, *Māhārāṣṭrī*, *Māgadhī*, *Ārdhamāgadhī*, *Prācīyā*, *Avantīkā*, *Dākṣhīṇ'ātyā*, *S'ākvarī*, *Bālīkā*, *Drāvid'ī*, *Abhīrī*, *Chāṇ'd'ālī*, *S'ābarī*, and *Pais'ācī*; but Vārāruchi, the oldest known grammarian of the *Prākṛit* dialects, knows but four—viz., the *Māhārāṣṭrī*, *S'aurasenī*, *Māgadhī*, and *Pais'ācī*; and Lassen, in the *Indische Alterthumskunde*, holds that, of those, only the *S'aurasenī* and the *Māgadhī* have a really local character—the former, as he assumes, having been the vernacular of a large district of Western, and the latter—which is also the *Prākṛit* in the inscriptions of King As'oka—of Eastern India; whereas the *Māhārāṣṭrī*, or the language of the Mahārrattas, does not seem to have been the language of the country the name of which it bears; and the *Pais'ācī*, or the language of the Pis'ācha, is obviously merely a fancy name. The principal *Prākṛit* dialect is the *Māhārāṣṭrī*; the lowest, according to some, the *Pais'ācī*, of which two varieties are mentioned; but according to others, the *Apabhram'a*—which word originally means 'a falling off'—i. e., a dialect which completely deviates from the grammatical laws of Sanscrit, but in this special application would designate a dialect even inferior to the *Pais'ācī*, and is compared by a grammarian to the language of the reptiles.

On the grammar of the *Prākṛit* languages, see Chr. Lassen, *Institutiones Linguae Pracriticae* (Bonn, 1837). The Sūtras, or grammatical rules of Vārāruchi, have been edited in the same work; but more elaborately, with a commentary, copious notes, an English translation, appendices, and an index, by Edward Byles Cowell, who has also added to this excellent edition, *An Easy Introduction to Prākṛit Grammar* (Hertford, 1854).

PRASE, a green variety of Quartz (q. v.), sometimes found crystallized in the same forms as common quartz, but more generally massive, or in prismatic and granular concretions. It is rather a rare mineral. It is sometimes cut as an ornamental stone, but is not highly esteemed.

PRATIQUE is, strictly, a limited quarantine. A ship is said to have performed pratique when her captain has convinced the authorities of a port that his ship is free from contagious disease; and he is thereupon permitted to open trade and communication with the shore.

PRATO—often, for distinction, called **PRATO IN TOSCANA**—a town of Italy, in the province of Florence (*Firenze*), 10 miles north-west of Florence, in a fertile plain, on the right bank of the Bisenzio, a feeder of the Arno, and on the railway between Florence and Pistoja. There are manufactures of straw-plait, woollen cloth, cotton goods, silk thread, &c.; also soap-works, tanneries, and copper-works. Copper-mines of considerable productiveness exist in the neighborhood. Pop. (1881) 13,410.

PRAWN (*polemon*) a genus of crustaceans, of the order *Decapoda*, and sub-order *Macroura*, in general form resembling lobsters, crayfish, and shrimps, but belonging to a family *Palæmonidae* remarkable for a long serrated beak projecting from the carapace. The upper antennæ are terminated by three filaments. There are many species of P., and some of those which inhabit the seas of warm climates attain a large size. Many of them are semi-transparent, and exhibit very fine colors; they are also very active creatures, and most interesting inmates of an aquarium, but are excessively voracious, and apt to make great havoc among its other inhabitants. The **COMMON P.** (*P. serratus*) attains a length of three or four inches. It is common on the British coasts, although not so abundant as the shrimp, and is generally taken in the vicinity of rocks at a little distance from the shore, and not in rock-pools. It is more esteemed for the table than even the shrimp. Osier-baskets, similar to those employed for catching lobsters, are employed for the capture of prawns; also nets about five or six feet wide, which are pushed along by means of poles, and are called *Putting Nets*. One side of the thorax of a P. is often found remarkably distended. This is owing to a parasitic crustacean, *Bopyrus crangorum*, one of the *Isopoda*, lodged under the carapace.

PRAXITELES, a celebrated sculptor of ancient Greece, of whose life nothing is known, except that he was a citizen of Athens, and lived in the 4th c. B. C. Pliny gives the date 364 B. C.

apparently as that in which P. began to flourish. His principal works—all of which have now perished—were: 1. Statues of Aphrodite (at Cos, Cnidus, Thespia, Latmia, Alexandria, and Rome), of which that of Cnidus was the most famous; 2. Statues of Eros (at Thespia, and Parium on the Propontis); 3. Statues, single and in groups, from the mythology of Dionysus (at Elis, Athens, Megara, and other places); 4. Statues of Apollo, the best of which was that representing Apollo as the Lizard-slayer. So far as we are entitled to form an opinion of the works of P. from the descriptions and criticisms of ancient writers, it would seem that they marked an epoch in the history of Greece—viz., the transition from the earnest, heroic, and reverential age preceding the Peloponnesian war, to the more corrupt and sensual times that followed it. The sculpture of Pheidias is inspired by a profound veneration for the majesty of the gods; that of P. sought to give expression to the looser and less divine conceptions of the national religion. The bewitching beauty of woman, and the intoxication of Bacchic pleasures, were his favorite subjects; but in his treatment of these, he displayed unrivalled sweetness, grace, and naturalness. His gods and goddesses were not very divine, but they were ideal figures of the fairest earthly loveliness.

PRAYER is a universally acknowledged part of the worship due to God; a simple and natural expression of dependence, which seems almost necessarily to follow from a belief in the existence of a god. Accordingly, we find it both where the object of worship is one Supreme Being and in systems of polytheism. It is also combined with every other part of worship. According to the Christian system, however, prayer is not the mere spontaneous approach of man to God, in the endeavor to appease his wrath, to win his favor, or to obtain from him any blessing; but the right to approach him in prayer, and the warrant to expect advantage in doing so, rest on the revelation of his own will. Nor is any truth more indisputably taught in the Bible, or more frequently brought into view, both in the Old and in the New Testament, than that God is the *hearer* of prayer.

But a difficulty presents itself, in respect to what may be called the theory of prayer. How can prayer be supposed to influence the divine mind or will? How can a belief in its power be reconciled with any view of the divine decrees, from the most absolute doctrine of predestination to the most modified scheme which recognizes the Creator as supreme in the universe? Such questions bring up the same difficulty which attends all other questions of the relations between the human will and the divine, the freedom of man and the sovereignty of God. But whatever seeming inconsistencies may be implied in speculation concerning them, the necessity of prayer and the power of prayer are acknowledged equally by men of the most opposite views; and generally with an acknowledgment of the inability of the human mind to solve some of the problems which are thus presented to it. The extreme predestinarian includes prayer among the means decreed of God along with the end to which it contributes. And whilst prayer is regarded by all Christians as of great value in its reflex influence on the feelings of the worshiper, this is scarcely ever stated as its whole value; however important this view of it may be deemed as illustrating the divine wisdom in making it one of the chief 'means of grace.'

Prayer being regarded by Christians as an *ordinance* of God, it follows that they must seek to be guided in prayer by the rules of his revealed will, in so far as his will has been revealed. It is therefore held by Christians in general, in accordance with their doctrine of the Atonement (q. v.) and of the Intercession (q. v.) of Jesus Christ, that the only true way of access to God is through the mediation of Jesus Christ, and that prayer must be made in the exercise of faith in him; the worshiper taking his stand upon the ground of the obedience or 'finished work and accepted sacrifice' of Christ, and looking up to Christ as now interceding in Heaven. It is also held, in accordance with the doctrine of man's corruption, that prayer can be truly made, in faith, and for things agreeable to God's will, only by the help of the Holy Spirit. Prayer, to be acceptable, must be for things agreeable to God's will, as that will is revealed in his Word; and therefore prayer for mere temporal or earthly good must be made in entire submission to his will; but prayer may be thus made for temporal or earthly good, the will of God having been revealed to that effect—an admirable instance of the grace of God.

Adoration, thanksgiving, and confession of sins, the accompaniments or adjuncts of prayer, are very generally regarded as parts of prayer; and prayer, which is strictly mere *petition*, is defined accordingly.

The Protestant churches all hold that prayer is to be made to God alone; the mediation of Jesus Christ and the help of the Holy Ghost being duly acknowledged. But in the Roman Catholic Church, and to some extent in the oriental churches, prayer of a kind is made also to saints, the Virgin Mary, and angels. See INVOCATION.

Prayer, according to Christians in general, must be made not merely in form or words, but with the heart. Accordingly, Protestants hold that prayer ought to be conducted in a language known to the worshippers. The Church of Rome has, on the contrary, maintained the general use of the Latin language, where that language is unknown to most of the worshippers.

Prayer for the dead (see following article) is rejected by Protestants, as having no warrant in the Word of God. But according to the Protestant creed, prayer is to be made for all the living—not only for believers but for unbelievers.

PRAYER FOR THE DEAD, the practice which prevails in the Roman Catholic, Greek, and other oriental churches, of praying for the souls of the deceased, with the intention and expectation of obtaining for them an alleviation of their supposed sufferings after death, on account of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. The practice of praying for the dead supposes the doctrine of PURGATORY (q. v.), although perhaps the converse is not necessarily true. Practically, however, the two may be regarded as forming part of one and the same theory, and especially if taken in connection with the doctrine of the Communion of Saints. It being once supposed, as the Roman Catholic system supposes, that relations subsist between the two worlds, that their members may mutually assist each other, it is almost a necessary consequence of the doctrine of purgatory, that the living ought to pray for the relief of their suffering brethren beyond the grave. We can but present an outline of this doctrine and of its history. It seems certain that some such doctrine existed in most of the ancient religions, and especially in those of Egypt, India, and China. It gives significance to many of the practices of the Greeks and Romans in reference to their dead. Its existence among the Jews is attested by the well-known assurance in 2d Maccabees, chap. xii., that 'it is a holy and wholesome thought to pray for the dead, that they may be loosed from their sins.'

The continued maintenance of the practice among the Jewish race, is plain from their sacred books; and a still more interesting evidence of its use has recently been discovered in the inscriptions disinterred in several Jewish catacombs of the first three centuries, at Rome and in Southern Italy, which abound with supplications: 'May thy sleep be in peace!' 'Mayest thou sleep in peace?' 'Thy sleep be with the good!' or 'with the just!' &c. Roman Catholics contend that the doctrine, as well as the practice, is equally recognizable in the early Christian Church. They rely on the parable of Lazarus and the rich man (Luke xvi. 19—31) as establishing the intercommunion of this earth with the world beyond the grave; and on Matt. xii. 32, as proving the remissibility of sin or of punishment after death; as well as on 1st Cor. xv. 29, as attesting the actual practice, among the first Christians, of performing or undergoing certain ministrations in behalf of the dead. The fathers of the 2d, 3d, and still more of the 4th and following centuries, frequently allude to such prayers as Clement of Alexandria, Tertullian, St. Cyprian, and especially St. John Chrysostom, Cyril of Jerusalem, and St. Augustine. The liturgies, too, of all the rites without exception contain prayers for the dead; and the sepulchral inscriptions from the catacombs, which reach in their range from the 1st till the 5th c., contain frequent prayers in even greater variety, and more directly intercessory, or rather more directly implying release from suffering than those of the contemporary Jews. In the services of the medieval and later church, prayers for the dead form a prominent and striking element. See REQUIEM.

The Abyssinians have separate services for the dead of all the several conditions and degrees in life, and continue to offer the mass daily for forty days after the death. The Protestant churches without exception have repudiated the practice. In the Burial Service of the first Book of Common Prayer authorized in the Church of England, some prayers for the deceased were retained; but they were expunged from the second Book; and no trace is to be found in that sanctioned under Elizabeth.

PRE-ADAMITES, supposed inhabitants of the earth anterior to Adam. The author of the opinion, or at least the writer in whose hands it first took a scientific form, was Isaac de la Peyrere, better known by his Latinized name *Pererius*. He was born of a Calvinist family of Bordeaux in 1594, and was attached to the service of the Prince of Condé. His theory was first made public in 1655, in the form of a commentary on the 12th, 13th, and 14th verses of the 5th chapter of St. Paul's Epistle to the Romans, which was followed, in the same year, by the first part of a formal treatise on the Pre-adamite hypothesis, and the theological consequences to be derived therefrom. According to his hypothesis, Adam was the progenitor of the Jewish race only, and it is only of him and his race that the Bible is designed to supply the history. Other races existed on earth before that of Adam; but of them the Bible contains no record, nor did the Mosaic law regard them or impose any obligation upon them. It was only under the gospel that they began to be comprehended

in the law, which through Christ was given to all the human races of the earth; and it is in this sense that, according to Peyrere, sin is said (Rom v. 13), to 'have been in the world until the law,' but not to have been 'imputed when the law was not.' For the Pre-adamite race, as the law was not, there was no *legal* offence. The only evil which Peyrere recognized was natural evil.

The same limited interpretation he extended to most other details of the Mosaic history. Thus, he regarded the deluge as partial, being confined only to the Adamite race. Other miraculous narratives of the Pentateuch and even of other books he restricted similarly. As his book was published in the Low Countries, he fell under the animadversion of the Inquisition, and eventually was arrested in the diocese of Mechlin, but was released at the instance of the Prince of Condé. He afterwards went to Rome, where he conformed to the Catholic religion, and made a full retraction of his erroneous opinions. He was offered preferment by the pope, Alexander VII., but returned in preference to Paris, where he entered the seminary of Notre Dame des Vertus, in which he resided till his death in 1676. The discussion has acquired new interest by recent discoveries of supposed evidences of human art and industry, in positions which, considered geologically, appear to their discoverers to be of an age beyond those limits which the Mosaic chronology assigns to the creation of Adam.

PRE'BEND (Lat. *præbenda*, from *præbere*, to furnish), the income or other provision assigned for the maintenance of a so-called prebendary, out of the revenue of a cathedral or collegiate church. After the definite constitution of chapters for the maintenance of the daily religious services in the bishop's church, or in other churches similarly established, endowments were assigned to them, which were to be distributed (*præbendæ*) in fixed proportions among the members. These portions were called *portiones canonica* or *præbendæ*. To the prebend was commonly attached a residence. The person enjoying a prebend is called a prebendary. —The name prebend is also given to an endowment assigned to a cathedral church for the maintenance of a secular priest.

PRECE'DENCE, the order in which individuals are entitled to follow one another in a state procession or on other public occasions. We find questions of precedence arising in very early ages both in Europe and in the East. Where such questions have arisen among ambassadors, as the representatives of different countries, great tenacity has often been shown in supporting the claims to rank of the states represented. In England, the order of precedence depends partly on the statute 31 Henry VIII. c. 10, partly on subsequent statutes, royal letters patent, and ancient usages. Among questions of precedence depending on usage, there are some which can hardly be considered so settled as to be matter of right, and are in a great degree left to the discretion of the officers of the crown. Formerly, they were adjudicated on by the Constable and Marshal in the Court of Chivalry; and since that tribunal has fallen into abeyance, the practice of persons aggrieved in these matters is to petition the crown, which generally refers the disputed question to the officers of arms. In Scotland, the Lyon Court has the direct jurisdiction in all questions of precedence.

It is a general rule of precedence, that persons of the same rank follow according to the order of the creation of that rank; and in the precedence of the English peerage, it has been fixed that the younger sons of each preceding rank take place immediately after the eldest son of the next succeeding rank. Married women and widows take the same rank among each other as their husbands, except such rank be professional or official, and it is an invariable rule that no office gives rank to the wife or children of the holder of it. Unmarried women take the same rank with their eldest brother; the wife of the eldest son, of any degree, however, preceding the sisters of her husband and all other ladies in the same degree with them. Marriage with an inferior does not take away the precedence which a woman enjoys by birth or creation; with this exception, that the wife of a peer always takes her rank from her husband. The following tables exhibit the precedence of different ranks as recognized by law in England.

TABLE OF PRECEDENCE AMONG MEN.

The Sovereign.
The Prince of Wales.
Sons of the Sovereign.
Grandsons of the Sovereign.
Brothers of the Sovereign.
Uncles of the Sovereign.
The Sovereign's Brothers' or Sisters' Sons.
The Archbishop of Canterbury, Primate of all England.
The Lord High Chancellor, or Lord Keeper, being a Baron.
The Archbishop of York, Primate of England.
The present Archbishop of Armagh, by the Irish Church Act (1869).
The Archbishop of Dublin.

The Lord High Treasurer.	} Being of the degree of Barons.
The Lord President of the Privy Council.	
The Lord Privy Seal.	} Above all of their degree; if Dukes, above all Dukes, &c.
The Lord Great Chamberlain.	
The Lord High Constable.	
The Earl Marshal.	
The Lord High Admiral.	
The Lord Steward of Her Majesty's Household.	
The Lord Chamberlain of Her Majesty's Household.	
Dukes.	
Eldest Sons of Dukes of the Blood Royal.	
Marquises.	
Dukes' Eldest Sons.	} Above all of their degree; if Dukes, above all Dukes, &c.
Earls.	
Younger Sons of Dukes of the Blood Royal.	
Marquises' Eldest Sons.	
Dukes' Younger Sons.	
Viscounts.	
Earls' Eldest Sons.	
Marquises' Younger Sons.	
Bishops of London, Durham, and Winchester.	
All other English Bishops according to seniority of Consecration.	
The present Bishop of Meath, and then the other Irish Bishops existing in 1869, according to seniority of consecration.	} Above all of their degree; if Dukes, above all Dukes, &c.
Secretaries of State, if of degree of a Baron.	
Barons.	
The Speaker of the House of Commons.	
Commissioners of the Great Seal.	
Treasurer of Her Majesty's Household.	
Comptroller of Her Majesty's Household.	
Master of the Horse.	
Vice Chamberlain of Her Majesty's Household.	
Secretaries of State, under the degree of Baron.	
Viscounts' Eldest Sons.	} Above all of their degree; if Dukes, above all Dukes, &c.
Earls' Younger Sons.	
Barons' Eldest Sons.	
Knights of the Garter.	
Privy Counsellors.	
The Chancellor of the Order of the Garter.	
The Chancellor of the Exchequer.	
The Chancellor of the Duchy of Lancaster.	
The Lord Chief Justice of the Queen's Bench.	
The Master of the Rolls.	
Lord Chief Justice of the Common Pleas.	} Above all of their degree; if Dukes, above all Dukes, &c.
Lord Chief Baron of the Exchequer.	
Lords Justices of the Court of Appeal in Chancery.	
Vice-chancellors.	
Judges and Barons of the degree of the Coif of the said Courts, and Judge of the Court of Probate.	
Bannerets made by the Sovereign under the Royal Standard in open war.	
Viscounts' Younger Sons.	
Barons' Younger Sons.	
Baronets.	
Bannerets not made by the Sovereign in person.	
Knights Grand Crosses of the Bath.	} Above all of their degree; if Dukes, above all Dukes, &c.
Knights Grand Crosses of the Star of India.	
Knights of St. Patrick.	
Knights Grand Crosses of St. Michael and St. George.	
Knights Commanders of the Bath.	
Knights Commanders of the Star of India.	
Knights Commanders of St. Michael and St. George.	
Knights Bachelors.	
Companions of the Bath.	
Companions of the Star of India.	
Cavalieri and Companions of St. Michael and St. George.	} Above all of their degree; if Dukes, above all Dukes, &c.
Eldest Sons of the Younger Sons of Peers.	
Baronets' Eldest Sons.	
Eldest Sons of Knights of the Garter.	
Bannerets' Eldest Sons.	
Eldest Sons of Knights of the Bath, and of St. Michael, and St. George.	
Eldest Sons of Knights Bachelors.	
Baronets' Younger Sons.	
Younger Sons of Knights of the Garter.	
Younger Sons of Bannerets.	
Younger Sons of Knights of the Bath.	} Above all of their degree; if Dukes, above all Dukes, &c.
Younger Sons of Knights Bachelors.	
Esquires.	
Gentlemen entitled to bear arms.	
Clergymen, Barristers-at-law, Officers in the Army and Navy, who are all gentlemen, and have their precedence in their respective professions.	
Citizens.	
Burgesses.	

TABLE OF PRECEDENCE AMONG WOMEN.

The Queen.
 The Princess of Wales.
 Princesses, Daughters of the Sovereign.
 Princesses and Duchesses, Wives of the Sovereign's Sons.
 Grand-daughters of the Sovereign.
 Wives of the Sovereign's Grandsons.
 The Sovereign's Sisters.
 Wives of the Sovereign's Brothers.
 The Sovereign's Aunts.
 Wives of the Sovereign's Uncles.
 Duchesses.
 Wives of the Eldest Sons of Dukes of the Blood Royal.
 Daughters of Dukes of the Blood Royal.
 Marchionesses.
 Wives of the Eldest Sons of Dukes.
 Daughters of Dukes.
 Countesses.
 Wives of the Younger Sons of Dukes of the Blood Royal.
 Wives of the Eldest Sons of Marquises.
 Daughters of Marquises.
 Wives of the Younger Sons of Dukes.
 Viscountesses.
 Wives of the Eldest Sons of Earls.
 Daughters of Earls.
 Wives of the Younger Sons of Marquises.
 Baronesses.
 Wives of the Eldest Sons of Viscounts.
 Daughters of Viscounts.
 Wives of the Younger Sons of Earls.
 Wives of the Eldest Sons of Barons.
 Daughters of Barons.
 Maids of Honor.
 Wives of Knights of the Garter.
 Wives of Bannerets.
 Wives of the Younger Sons of Viscounts.
 Wives of the Younger Sons of Barons.
 Wives of Baronets.
 Wives of Knights Grand Crosses of the Order of the Bath.
 Wives of Knights Grand Crosses of St. Michael and St. George.
 Wives of Knights Commanders of the Order of the Bath.
 Wives of Knights Commanders of St. Michael and St. George.
 Wives of Knights Bachelors.
 Wives of Companions of the Bath.
 Wives of Cavalieri and Companions of St. Michael and St. George.
 Wives of the Eldest Sons of the Younger Sons of Peers.
 Daughters of the Younger Sons of Peers.
 Wives of the Eldest Sons of Baronets.
 Daughters of Baronets.
 Wives of the Eldest Sons of Knights of the Garter.
 Daughters of Knights of the Garter.
 Wives of the Eldest Sons of Bannerets.
 Daughters of Bannerets.
 Wives of the Eldest Sons of Knights of the Bath.
 Daughters of Knights of the Bath.
 Wives of the Eldest Sons of Knights Bachelors.
 Daughters of Knights Bachelors.
 Wives of the Younger Sons of Baronets.
 Wives of Esquires and Gentlemen.
 Wives of Citizens.
 Wives of Burgesses.

At the coronation of, Charles I., the rule of precedence of the nobility of England was introduced into Scotland; and it was arranged that peers of England (or their sons, &c.), of a given degree, should within England take precedence of peers of Scotland of the same degree; and that this precedence should be reversed in Scotland. But by the acts of Union of Scotland and Ireland, the precedence in any given degree of the peerage has been established as follows: 1. Peers of England; 2. Peers of Scotland; 3. Peers of Great Britain; 4. Peers of Ireland; 5. Peers of the United Kingdom, and Peers of Ireland created subsequently to the Irish Union. A similar order is understood to obtain in regard to baronets, though in Ireland it seems lately to have become the practice to allow all baronets to rank according to the respective dates of their patents. The relative ranking of the great officers of the crown of Scotland was thus settled by statute in 1623 and 1661.

Lord Chancellor.
 Lord Treasurer.
 Archbishop of St. Andrews.
 Archbishop of Glasgow.
 Earls and Viscounts according to their ranks.
 Bishops according to their ranks.
 Lord Privy Seal, } first of their rank.
 Lord Secretary, }

Lord President of the Court of Session.
 Lord Register.
 Lord Advocate.
 Lord Justice Clerk.
 Lord Treasurer Depute.
 Lords of Session, according to their admission.
 Barons and Gentlemen, being Councillors, according to their admission.

The right of the judges of the Court of Session, in Scotland, to precede baronets, has generally been admitted. Lyon King of Arms has precedence 'before all knights and gentlemen within the kingdom, not being officers of state, or senators of the College of Justice.' It seems to be held in England that the precedence of Scotch officers of state, judges, &c., as recognized before the Union, does not now extend beyond Scotland.

There are rules for precedence for the members of different professions, recognized among themselves, but which do not confer general social precedence. Doctors in the universities rank thus: 1. Of Divinity; 2. of Law; 3. of Medicine.

PRECENTOR (Lat. *præ*, before; and *cantor*, a singer), the official in a chapter, whether cathedral or collegiate, whose duty it was to lead the singing. He commenced the psalm or hymn, which was taken up, and repeated either by the celebrant or another of the body, or by the rest of the choir. In modern chapters, the precentor ranks next in dignity to the provost or dean. Among the Presbyterian bodies, the precentor is the official who raises and conducts the psalmody, and is generally provided with a desk immediately beneath the pulpit.

PRECEPT, a legal term, used in Scotch Law in certain departments, generally signifies an order to do something. Thus, a precept of sasine is an order by the superior of lands to his baillie to infeft the vassal. A precept of *clare constat* is an order by a superior to infeft the vassal's heir, so called because the superior is quite satisfied of the propinquity.

PRECEPTORY, the name given to certain houses of the Knights Templar, the superiors of which were called Knights Preceptor. All the preceptories of a province were subject to a provincial superior, called Grand Preceptor; and there were three of these who held rank above all the rest, the grand preceptors of Jerusalem, Tripolis, and Antioch. Other houses of the order were called 'commanderies.'

PRECESSION. If the earth were truly spherical and homogeneous; or if it were composed of spherical layers each of uniform density; or, more generally, if it were such that the resultant of the attractions exerted on all its parts by any other body should always pass through a definite point in its mass, its diurnal rotation would not be affected by the attraction of any other bodies. If originally rotating about a principal axis of Inertia (q. v.), it would for ever revolve about it, and the direction of the axis would remain fixed in space. To put this in more popular language, the Pole-star (q. v.) would always be the same star. But, although the earth rotates about an axis almost exactly coinciding with its axis of figure, the attraction of various bodies, especially the sun and moon, on the oblate portion at the equator, tends to give a rotation about an axis in the plane of the equator; and the combination of these two rotations gives rise to a shifting of the instantaneous axis of rotation in the earth and also in space. As already mentioned (see NUTATION), the earth's axis of revolution describes a waved curve (very nearly circular) about the pole of the ecliptic, and in a direction contrary to that of the order of the signs of the Zodiac (q. v.). This waved curve may be conceived to be described as follows.

The pole of the earth, P, revolves in about 19 years in a little ellipse, whose center, O, travels uniformly in a small circle of the sphere, AO; the center E, of the latter is the pole of the ecliptic. The precession is the portion AO of this circle measured from any assumed point, A; and the small arc, OP, by which the true place of the earth's pole differs from its mean place, is the nutation. The nutation is generally resolved along, and perpendicular to, EO; and the components so found are the nutation in ecliptical latitude and longitude. This rough sketch is intended

merely to shew the nature of the phenomenon, for the curb described by P about O is only approximately elliptic. Its greatest radius-vector, however, is exceedingly small, amounting only to about eighteen seconds of arc. AO, also, is not exactly circular,

but very nearly so, as its radius, EO, is the *obliquity of the Ecliptic* (q. v.), which we know varies very little from the angle $23^{\circ} 28'$. The equinoxes, being 90° distant from E, and also from O, which may be taken as the mean place of P, are at Δ and Ψ in the diagram. And as O moves round E in the reverse order of the signs, so do the equinoxes, and in the same period—viz., 25,868 years. The effect is, of course, that while the earth's pole describes the small circle, AO, in the heavens, about the pole of the ecliptic, the equinoxes make one complete revolution in the ecliptic against the order of the signs. Thus, in turn, all stars lying near the circle AO, become, each for a time, the *Pole-star* (q. v.). It may seem strange that the term precession should be applied to a retrograde motion; but, from the point of view of the observer, it is evident that the equinox, if on one day it arrive at the meridian of a place simultaneously with a fixed star, will next day arrive at the meridian *sooner* than the star, or will precede it in time of transit; and this is the origin of the term.

The physical explanation of the cause of precession is almost identical with that of the conical motion of the axis of a top about the vertical; the difference between the two being that, in the case of the top, the conical rotation of the axis takes place in the *same* direction as the rotation of the top about the axis, while in the case of the earth, the pole of the axis turns about the pole of the ecliptic in the *opposite* direction to that in which the earth revolves about its axis. But the circumstances of the earth's motion are easily procured by a modification of the spinning-top, such as that of Troughton (used for the determination of latitudes at sea), if the center of the gravity of the whole mass be depressed *below* the point of suspension. If the axis of a top be vertical, there is no precession; similarly, when the sun or moon is in the plane of the equator, no effect is produced by them on the position of the earth's axis. When the axis of the common top is inclined, gravity tends to make it fall over; in similar circumstances, it tends to restore the axis of Troughton's top to the vertical; in either case tending to give the top a rotation about a horizontal axis perpendicular to that about which it is at the instant rotating; and the effect on the top is to cause a slow conical motion of its axis about the vertical. The sun or moon, in like manner, when not in the plane of the equator, tend to make, by their attraction, the earth turn about an axis perpendicular to that about which it is actually rotating. It is the composition of these rotations which gives rise to precession; but, though it would not be difficult to give a satisfactory investigation of the question without using formidable mathematical methods, the length of such an investigation prevents our giving it here.

The simplest approximation we can give to the physical explanation, that originally given by Newton, must therefore suffice. We have seen (see PERTURBATIONS) that the node of a satellite's orbit tends always to *regrade* on the plane of relative motion of the primary and the disturbing body. Suppose, for an instant, the protuberant parts of the earth at the equator to be satellites, revolving about a *spherical* earth. The effect of the sun's or moon's disturbing force upon these satellites would be to make the nodes of their orbits regrade. And exactly the same result will follow if they be attached to the earth, only that the rate of regression will now be much slower, as the whole mass of the earth will share in the motion. This is one of the most ingenious of the wonderful series of explanations of celestial phenomena which were given in the *Principia*.

PRECIOUS STONES, a name almost synonymous with Gems (q. v.) in its widest sense, and partially extended to stones of larger size employed for ornamental purposes, but not to those which are used in architecture.

PRECIPITATION, in Chemistry, is an operation in which decomposition occurs in a fluid, either through the action of the air, or of a gas, or of a chemical agent in solution; and is accompanied by the deposition of a solid substance that was previously held in solution. The substance employed to produce the precipitation is called the *precipitant*, and the substance which is separated by its action, the *precipitate*. For example, if a solution of carbonate of protoxide of iron be exposed to the air, a precipitate of hydrated sesquioxide or peroxide of iron speedily falls; if a current of sulphuretted hydrogen gas be passed through a solution of acetate of lead, a black precipitate of sulphide of lead is thrown down from the clear and colorless solution; and if a solution of corrosive sublimate (bichloride of mercury) be added to a solution of iodide of potassium, a yellow precipitate of biniodide of mercury is thrown down. The precipitant must be added with caution, as, in many cases, an excess of it redissolves the precipitate.

In qualitative analysis—that is to say, in determining the presence of substances without reference to their quantity—the color, solubility, &c., of the precipitate thrown down by numerous tests, as sulphuretted hydrogen, solutions of nitrate of silver, iodide of potassium, ferrocyanide of potassium, &c., afford the most useful information; and in quantitative analysis, the amount

of precipitate thrown down from a given quantity of a solution, is often employed to determine the strength of the latter. For example, if a solution of nitrate of silver is added to an ounce of a solution of hydrocyanic acid of unknown strength, till no further precipitation ensues, we may readily calculate, from the weight of the white precipitate of cyanide of silver, how much anhydrous hydrocyanic acid was present.

PRECOCITY has been regarded as an indication of cerebral disease; and American physicians have not hesitated to identify this manifestation with chronic inflammation of the membranes of the brain. If it is not always, it is often associated with such intense activity of the whole system, and with morbid conditions, such as the scrofulous diathesis, as to usher in actual disease, premature decay, and early death. The decay often consists in mental feebleness and fatuity; or where no such formidable issue follows, in the reduction of what promised to be transcendent genius to commonplace mediocrity. The closing chapters of the history of many wonderful calculators—Infant Rosciuses, Infant Lyras, &c.—illustrate this. It is hence no mere poetic figure to say that the lamp of the mind lives upon and burns itself out. Yet there are numerous exceptions, such as Johnson, Mozart, Fergusson, Davy, where early genius grew into great and masculine powers.

This rapid development in infancy or youth of faculties which are generally the result of protracted growth; and the intuitive acquisition of knowledge, which, under ordinary circumstances, is attained by laborious effort and cultivation, are most frequently witnessed in those of feeble and delicate constitution and of stunted frame. It is often seen as a concomitant of rickets, as in Pascal, Pope, &c.; and the dux of the school may often be pointed out from the disproportionate size of his head. While this development includes marvelous exercise of memory, of imagination, of constructive talent, of artistic genius, it rarely extends to judgment, reasoning, and sagacity. There appears to be evidence that this quality is not merely morbid, but that it exercises, reflexly, a detrimental influence upon healthy assimilation and growth, and arrests or retards that building up of the organization, upon which the ultimate capacity and usefulness of the individual depend. Education sometimes produces such prematurity, or fosters it where it has previously existed; so that the modern form of mental exhaustion, 'the overworked brain,' may be said to originate in the school-room. It is certainly illogical to employ this fact, as has been done, against infant schools; but it is incumbent to keep such a relation in view in all educational efforts; to avoid high pressure and stimulation, to adapt the kind of instruction to the age, and, so far as may be practicable, to the strength and tendencies of the pupils; and to combine systematic physical with all intellectual training.—Brigham, *Remarks on the Influence of Mental Cultivation and Mental Excitement upon Health*; Combe, *On the Management of Infancy*; Caldwell, *Thoughts on Physical Education*.

PRECOGNITION, a Scotch legal term, which denotes the heads or substance of the evidence which a witness in a criminal cause proposes to give at the trial. In all cases, before a trial, it is necessary for the solicitor to see the witnesses, and elicit from them the nature of the testimony they can give; and the heads of this testimony are called the precognitions, when written out. But the word has a technical meaning when applied to the examination of the witnesses before a justice of the peace or the judge-ordinary by the procurator-fiscal, previous to, and by way of enabling him to know how to frame, the charge. On such an occasion, the witnesses are examined or precognosed, a proceeding which corresponds to the evidence given in England before a magistrate or justices of the peace, and called there the depositions.

PREDESTINATION, a theological word, used to denote the eternal decree of God, whereby 'the elect' are foreordained to salvation. The correlative decree, whereby others are held to be foreordained to perdition (though it might with perfect correctness of language be included under the same term), is commonly distinguished by the other term—Reprobation.

The theory of Predestination had, like the doctrine of Election (q. v.), its origin in the attempts of theological system to define the relations of the human and the divine will, and to reconcile the phenomena of human freedom with the belief in divine omnipotence. God's absolute will is represented by it as determining the eternal destiny of man, not according to the foreknown character of those whose fate is so determined, but according to God's own mere choice. They who are thus foreordained to eternal life are led to believe and live by the 'irresistible grace' of the Holy Spirit. In human salvation, therefore, God's will is everything; man's, nothing.

It was in the discussions between Pelagius and Augustine that the Predestinarian view of the divine 'decree' was first fully evolved; and since their time, opinion in the church has run in two great currents—the one perpetuating the influence of Pela-

gius, who regarded that decree as subordinated to the divine foreknowledge of human character; the other, that of Augustine, who maintained the absolutism of that decree, and its independence of all prior human conditions. Pelagius recognized a possibility of good in human nature; Augustine denied any such possibility, apart from the influences of divine grace. The one held that the choice of salvation lay in man's will; the other, that man's will had no active freedom or power of choice since the fall. In 529, the system of Augustine was established by the Council of Arausio (Orange) as the rule of orthodoxy in the Western Church; but the reaction against the strictly logical yet essentially *unmoral* nature of his dogma has been perpetually manifested by representatives of the more humane, though perhaps less logical doctrine of Pelagius, in every period of the church. In the days of the schoolmen, the discussions of the Scotists and Thomists—after the Reformation, the contests leading to the condemnation of Arminius in the Council of Dort, and the widening separation that now divides the disciples of Calvin from those theologians who hold broader and freer views on the subject of the *atonement*—indicate the impossibility of the human reason and conscience ever resting satisfied with a merely and absolutely logical theory of the relations between the will of God and the moral responsibility of man. The tendency of modern inquiry seems to be to abandon the discussion of a point so obviously incapable of being determined by human intelligence, and to pursue, instead, examination into the moral and practical bearing upon our human conditions of that which we are able to learn concerning God and His will. The moral meaning of that will is of vital moment to men; the extent of its power over their own wills, they apparently cannot determine.

PREDICABLES. This is a term in the scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan; *genus*, *species*, *difference* (differentia), *property* (proprium), and *accident* (accidens). The first two—Genus and Species—name the higher and lower classes of the things classified; a Genus comprehends several Species. The other three designations—Difference, Property, Accident—express the attributes that the classification turns upon. The Difference is what distinguishes one species from the other species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other species of the genus *felis*. The Property expresses a distinction that is not ultimate, but a consequence of some other peculiarity. Thus, 'the use of tools' is a property of man, and not a difference, for it flows from other assignable attributes of his bodily and mental organization, or from the specific differences that characterize him. The Accident is something not bound up with the nature of the species, but chancing to be present in it. For instance, the high value of gold is an Accident; gold would still be gold though it were plenty and cheap.

It was by an arbitrary and confusing employment of the notion of Predication, that these various items of the first attempt at a process of systematic classification, were called Predicables, or attributes that might be 'predicated,' that is, affirmed, of things. All that is needful to affirm is that a certain thing belongs to a given species or genus; and that to belong to the species is to possess the specific differences; and to belong to the genus is to possess the generic differences. We may also, if we please, *affirm* (or predicate) that the thing does belong to the species, or does possess the specific difference; but this power of affirming has no need to be formally proclaimed, or made the basis of the whole scheme.

The allied term 'Predicament' is another case where an abusive prominence is given to the idea of predication. The Predicaments, or Categories, were the most comprehensive classes of all existing things—under such heads as substance, attribute, quantity, quality, &c.; and it could be predicated of anything falling under any one head that it does so fall under. Thus, 'virtue' is an attribute; and therefore we might say that 'attribute' can be predicated of 'virtue.' But the notion of predication does not indicate the main fact of the process in this case, any more than 'predicable' in the foregoing. *Classification*, and not predication, is the ruling idea in each.

PREDICATE. See PROPOSITION.

PRE-ESTABLISHED HARMONY. See LEIBNITZ.

PRE-EXISTENCE, DOCTRINE OF. The notion that human souls were in existence before the generation of the bodies with which they are united in this world, was anciently, and is still, widely spread throughout the East. The Greek philosophers too, especially those who held the doctrine of Transmigration (q. v.), as the Pythagoreans, Empedocles, and even Plato—if with him pre-existence is not simply a symbolical myth—were familiar with the conception. Among the early Christians, the assumption of such pre-existence was connected with the belief, that God had created the souls of men before the world, and that these were united with human bodies at generation or at birth. Subsequently,

the followers of this opinion were termed *Pre-existencists*, to distinguish them from the *Traducianists*, who held that children received soul as well as body from their parents. Direct intellectual interest in this doctrine has nearly altogether ceased in modern times, yet the dream—for whether true or false, it is and can be nothing but a dream in our present state, and with our present capabilities of knowledge—has again and again haunted individual thinkers. Wordsworth has given poetical expression to it in his famous ode—*Intimations of Immortality from Recollections of Early Childhood* :

Our birth is but a sleep and a forgetting.
The soul that rises with us—our life's star,
Hath had elsewhere its setting,
And cometh from afar,
Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home.

Nor must we overlook the fact, that the latest philosophy of Germany—that of the younger Fichte, has revived the doctrine; while it forms the basis of one of the deepest works in modern theology, that of Julius Müller, *Die Christliche Lehre von der Sünde* (The Christian Doctrine of Sin. English, Edin. 1856).

PRÉFET, the name of an important magistrate in modern France, so called from his exercising functions somewhat similar to those of the *Præfectus urbi* at Rome. See **PRÆFECT**. In old times, the officers whose duty it was to superintend the details of administration in the provinces were called *Maîtres des Requêtes*. Under Henry II., their office was rendered permanent; and at a later period, their powers were much extended, and they were known by the designation of *Intendants*. The intendants were abolished at the Revolution; and a law of 1800 first appointed préfets for the departments, with powers greatly similar to those of the intendants. The office, as it now exists, includes the superintendence of the police establishment, the enforcement of the laws, and the entire control of the administration of the departments. The préfet is the head of the executive, exercises most of the government patronage, including the appointment of a *sous-préfet* for each *arrondissement*, and in time of tumult may call out the military, or provisionally declare a state of siege. The chief check on these extensive powers is to be found in the *Conseil de la Préfecture*, which acts in some measure as a court of appeal from the decisions of the préfet.

PRE'GEL, a river of Prussia, rises in the province of East Prussia, where it is formed by the union of the Pissa and the Angerap near Insternburg. It flows almost due west past Weihaus and Königsberg, and after a course of more than 90 miles, enters the Frisches Haff, about six miles below the latter town. The P. is navigable even at Insternburg; and at Königsberg, is 720 feet broad. Its principal tributaries are the Alle from the south, and the Instern from the north. The canal of Deine connects it with the Kurisches Haff.

PREGNANCY, CONCEALMENT OF, is a criminal offence, or rather it is taken to be the main proof of the offence of concealing the birth of a child in certain circumstances. It is only where the child is dead, and has been secretly disposed of under suspicious circumstances, that the mother is punishable. Hence, the offence consists in endeavoring to conceal the birth, and as part of such concealment, to conceal the pregnancy, the child having already died. If the woman failed to give publicity of her situation beforehand, it is presumed that this was done from the improper motive, viz., to murder or destroy the child. To complete the offence, it is not necessary that the child should have been born alive; but if the child can be shown never to have lived, the prisoner must be acquitted. A usual test of concealment is, that the mother made no preparations for her delivery, nor provided child's clothes.

PRE'HNITE, a mineral, composed chiefly of silica, alumina, and lime, the silica sometimes about 50 per cent. of the whole; but with small and variable proportions of peroxide of iron, peroxide of manganese, potash, soda, and water. It is a widely-diffused mineral, and although first discovered at the Cape of Good Hope, has been found in great beauty in some places on the continent of Europe and in Scotland. P. exhibits a great variety of forms, with considerable variety of color; being found in crystals in fan-shaped and cockscorn-like groups, granular, reniform, fibrous, &c. It is colorless, or more generally greenish, and sometimes yellowish. See **JADE**.

PRE'LATE (Lat. *prælatus*, one set over), in Church Law, is the name given to the holders of those higher dignities in the church, to which, of their own right, is attached a proper jurisdiction, not derived by delegation from any superior official. In this sense, the name comprises not only prelates of the first class, as bishops, but also the heads of religious orders, abbots or priors of religious houses, and other similar ecclesiastical dignitaries. These, for the most part, are privileged to wear the insignia of

the episcopal rank. In the Roman court, many of the officials, although not possessing episcopal or quasi-episcopal jurisdiction, have the insignia and the title of prelate. They are of two classes—the higher, called *del mantelletto* ('of the little mantle'), and the secondary, called *del mantellone* ('of the great mantle'), from the robe which they respectively bear.

PRELUDE (Lat. *præ*, before, and *ludo*, I play), in Music, a short preface or introduction to a piece, intended to awaken the attention of the audience, generally smooth and flowing, and consisting of a short motive which is kept throughout; or it may be composed of a succession of harmonies uninterrupted or connected by passages. It is in the same key with the piece which it is to introduce, and to which it is intended as a preparation.

PREMISES is a common legal term to signify a house or building, and the outhouses and places belonging to it, all of which are treated as one thing. It is also used to denote a certain part of an English deed, which is further subdivided into the form, date, parties, recitals, testatum, and parcels. The use of the word in this sense is derived from the subject-matter of a conveyance or deed being first stated or described in full, and afterwards referred to collectively as the premises (Lat., *premissa*, things spoken of or rehearsed before).

PREMISS. See SYLLOGISM.

PREMONSTRATENSIAN (called also **NORBERTINE**) ORDER, a religious order, which at one time was among the most numerous and powerful of the monastic bodies of Germany, in which country its most important houses were established. It was founded in the early part of the 12th c. by St. Norbert, a native of Xanten, in the diocese of Cleves, of which church he was a canon. Struck by the prevailing irregularities and carelessness, not only of secular, but also of conventual life among the clergy and the monks, he resolved on attempting a reform of both, and obtained permission, in 1120, to found a cloister in the diocese of Laon, in France. The place selected by him was a spot in the forest of Concy, pointed out, as he believed, in a vision, and thence called *Pré Montré*, or in Latin, *Pratum Monstratum*, 'the indicated meadow,' from which the name of the order was taken. In accordance with the double object which he sought to attain, Norbert organized his new order, which was substantially that of the Canons Regular of St. Augustine, as well with a view to the sanctification of the members, as to their usefulness in effecting the reformation of the age. Himself a man of remarkable piety and austerity of life, his rule is a return to the primitive fervor of the monastic institute; and the great work which he proposed for his brotherhood, in addition to the daily choral services of the church, was the practical instruction of the people, and the direction of consciences in the confessional. It was taken up with ardor, and spread rapidly in France and the Low Countries, and afterwards—on Norbert's being chosen, in 1127, Archbishop of Magdeburg—in Germany; the abbot of the mother-house at Concy, however, retaining the rank of general and of superior of the entire order. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain.

In the same spirit of reformation, Norbert established an order of nuns, which attained to equal success. In the end of the 15th c., the P. O. had no fewer than 1500 convents of men, and 500 of women, nearly all in France, Germany, and the northern kingdoms. A relaxation of the institute having taken place, in the progress of time there was a movement in the order, towards the close of the 16th c. (1573), similar to that which, in the Franciscan Order (q. v.), led to the reform of the so-called conventual Franciscans; but the reformed communities in the Premonstratensian institute remained united with the older body; and in 1630, the reformed rule was accepted by all in common. The order, however, has gradually fallen in popularity. In France, its numbers had declined very much even before the Revolution. Since that event, it may be said to have disappeared, except in Germany, where (in Austria) some magnificent, though thinly peopled houses of the order are still maintained.

PRENZLAU, or **PRENZLOW**, a town of Prussia, in the province of Brandenburg, stands on the northern shore of the lower Lake Ucker, 71 miles north-north-east of Berlin. It contains a mineral spring, several baths, and among its churches, the beautiful Gothic *Marienkirche*, one of the most remarkable brick buildings in the country; date 1325—1340. Pop. (1880) 16,933, who carry on several manufactures, but are chiefly engaged in growing tobacco and corn, and in breeding and trading in cattle. Here, in October 1806, a body of Prussian troops, 16,000 strong, under the Prince of Hohenlohe, surrendered, after the defeat of Jena, to the French under Murat.

PREPOSITIONS are words that express certain relations between ideas—between the idea of an action and the idea of a thing, or between the idea of one thing and the idea of another thing. 'The river runs to the sea. The glass stands on the table.

The dog lies under the table. He runs round me. She runs from me. The house by the wood. The house in the wood.' In all the instances just given, the relation is of one kind—that of place or direction. And this was the original signification of all prepositions. They gradually, however, came to express other relations. Thus: 'That depends on you. Subjects are under the sovereign. She got round her father. Vice springs from idleness. Wood is consumed by fire. Your enemy is in your power.' The transition from the palpable, physical relation to the more abstruse mental relation, is, in most cases, obvious.

A preposition is distinguished from an adverb by its always requiring an object (a noun or pronoun) after it. In the sentence, 'He runs about,' *about* is an adverb describing the mode of running; in 'He runs about the house,' it is a preposition referring the direction of the running to a particular object.

Many relations are expressed by prepositional phrases; as, *in stead of*, *with regard to*, *apart from*. The preposition *beside* is evidently an abbreviation of such a phrase—*by the side of*. This tendency in phrases to become simple prepositions, is manifest in other cases. Instead of the full expression, 'on this side of the river,' we often hear, 'this side the river,' where *this-side* has the force of a preposition, and may yet come to be written *thisside*.

Of the relations expressed in the modern forms of the Aryan tongues by prepositions, a great many were formerly expressed by cases. See DECLENSION, INFLECTION, PHILOLOGY.

Along with prepositions are classed certain particles, which, although they may not stand by themselves and govern a case, are yet used in composition with verbs in the same way as the prepositions proper; as in *outrun*, *replace*.

The simple prepositions (Eng. *in*, Dan. *i*, Lat. *in*, Gr. *en*; Eng. *on*, Gr. and Goth. *ana*, Ger. *an*, Slav. *na*; Eng. of, Goth. *af*, O. H. Ger. *aba* or *apa*, Ger. *ab*, Sans. *apa*, Gr. *apo*, Lat. *a*, *ab*; Eng. *by* [be], Goth. *bi*, Ger. *bei*, Gr. *epi*, Sans. *abhi*; &c.) belong to the primary or radical words of language. They are often identical with the pronominal roots (see PRONOUNS), and along with them form a class of roots whose primary signification is position or relation in space. All attempts, like those of Tooke, to make them derivatives from verbs, are futile. On the contrary, verbs and other parts of speech are often derived from prepositions, as *utter from out*; *open and upper from up*. Some prepositions have a derivative form, as *after* (from the root of *of*), Lat. *inter* (*in*); others are compounded of two prepositions, or a preposition and prepositional particle, as *upon*, *but* (i. e., by out, or be out), *before*, *within*, *into*. Other prepositions, again, contain a noun, as *against* (A. S. *ongenegen*, or *tó gegnes*; where, from the forms in the allied languages, the element *gegen* is clearly a substantive, the primary meaning of which, however, has not been made out); *among* (A. S. *gemang* or *ongemang*, *gemang* meaning primarily mixture); *between* (i. e., by or be, two or twain). Such prepositions as *during*, *except*, were originally participles used absolutely; thus, 'during the war' = the war during or lasting, i. e., while the war lasted or lasted; 'except this' = this excepted (*hoc excepto*).

The study of the etymological relations of prepositions is instructive, as showing how near to one another often lie the most opposed meanings. They are, as it were, the opposite poles of one and the same conception—correlatives depending on a common ground relation, and are thus naturally expressed by words that are radically the same. Thus, Eng. *up* corresponds to Goth. *uf*, Sans. *upa*, Gr. *hypo*, Lat. *sub*. The meaning of *up* is motion from below to above, leaving, however, the idea of the upper terminus the more prominent; *uf*, *hypo*, *sub*, on the contrary, are used to express *under*; but that the notion of upward motion lurked in these roots, is clear from such Latin compounds as *suspicio*, to look up at a thing; *sustineo*, to hold up; and it only required a slight modification—a kind of comparison—to convert them into *ufar*, *hyper*, *super*, meaning 'above'—a result which the English attains by adding the preposition *on* (upon). The same principle is copiously exemplified in the numerous forms and derivatives of the prepositional root FR, in Sans., Gr., Lat., and Sl., PR, in which motion or removal from the speaker in the front direction seems to be the ground idea. Thus, when in reference to any epoch, we speak of the events that have *preceeded*, and those that are *predicted* as to come, the same particle *pre* points in two opposite directions.

PRE-RAPHAELITE. See HUNT (W. H.).

PREROGATIVE COURT, in England, was the court wherein all wills were proved, and administrations taken out. It was so called because it belonged to the prerogative of the archbishop to take charge of these matters, which formerly fell under ecclesiastical superintendence. Hence there was a Prerogative Court for the province of Canterbury, and another for the province of York. This jurisdiction was entirely taken away in 1858 from the ecclesiastics, and transferred to a new court called the Probate Court (q. v.).

PRESBURG (Lat. *Posonium*; Magyar, *Pozsony*; Slav. *Press-burek*), a town in the extreme west of Hungary, close upon the

frontier of Lower Austria, is built on the left or northern bank of the Danube, 41 miles by railway east of Vienna. The neighboring hills are clothed with vineyards. It was long the principal city of Hungary, having been made the capital in 1541, when the Turks seized possession of Buda; and even as late as the last quarter of the 18th c., it was the most beautiful, and the most populous town in the kingdom; but when Joseph II., in 1784, restored to Buda its ancient dignity of being the capital of Hungary, and the scene of the coronation of its kings, the sources of the prosperity of P. began to be dried up. Its population, in 1880, was 48,006, of whom more than two-thirds were Roman Catholics, about 10,000 Lutherans, and 7000 Jews. Fully one-half of the inhabitants are German, and German is the prevalent language. The most notable buildings in the town are the (Gothic) cathedral, in which the kings of Hungary were crowned; the royal palace, a vast square structure overlooking the town, accidentally burned in 1811, and not since repaired; the Capuchin, Franciscan, and Ursuline monasteries, with beautiful churches attached to them; the Land-Haus (Hall of the Hungarian Diet), &c. The transit-trade by steam-boat and railway, especially in corn, is very great, and gives considerable animation to an otherwise quiet place. P. carries on manufactures of silks, woollens, leather, paper, tobacco, glass, and chemical products. Outside the town lies the 'King's Hill' (*Königshügel*), to which the sovereigns of Hungary were wont to ride after their coronation, and brandish their swords towards the four quarters of the heavens, signifying by that symbolic act that they would defend Hungary from danger—come whence it might. A treaty was concluded here between Napoleon and the Austrian emperor—known as the 'Treaty of Presburg'—December 27, 1805, in virtue of which Austria ceded Venice to France, and the Tyrol to Bavaria.—P. gives name to a 'county.'

PRESBYTER, PRESBYTERIANISM. Presbyter (Gr. *presbyteros*, elder) is the title of an office or dignity in the Jewish synagogue, and also of one of the grades in the Christian hierarchy. In the latter sense, the title has been the occasion of a protracted controversy as to the respective claims of the Bishop (q. v.) and the Presbyter, which, except historically, would be out of place in these pages. The word presbyter not unfrequently occurs in the Epistles and the Acts of the Apostles, and in more than one of these passages, it is certainly applied to persons whose office would seem to be in all respects the same as that which is claimed for the 'bishop' in the episcopalian theory. From this identity of name, the identity of office has been inferred, and it has been hence concluded, that the distinction of bishops and presbyters is a human and post-apostolic ordinance. Advocates of the episcopal theory admit that the name presbyter is occasionally given, both in Scripture and in the early church writers, to persons who bore the office of bishop (*episcopos*), and that the latter certainly was in all cases a presbyter; but they contend that besides being a presbyter, he was also something more and something higher. That the office of Timothy, for example, was superior to that of a presbyter, is conceived to be plain from St. Paul's instruction to him (1st Timothy v. 19) as to how he should receive testimony against a presbyter. The same is inferred from Titus i. 5. On the other hand, no example, it is affirmed, appears of a presbyter sitting in judgment on a bishop, or 'appointing bishops in every city.' But the Presbyterians do not admit the validity of these arguments, inasmuch as they assert the identity of presbyter and bishop, and the right of co-presbyters both to judge a brother, and also to ordain to the office of the ministry. Episcopalians rely still more however, on the apostolic Fathers, and those of the 3d and 4th centuries.

Among the Fathers of the former period, Clement of Rome, and even more plainly, Ignatius of Antioch, point to the bishop's superiority as already established, and they are followed by Tertullian, Irenæus, Clement of Alexandria and Cyprian. On the Presbyterian side, a remarkable passage is quoted from Jerome, in which, while repressing the pretensions of deacons to equality with presbyters, he appears to place the presbyter on the same level with the bishop in all the functions of the ministry except the power of ordination. The explanation of this passage, according to the Episcopalian view, is found in what has been already indicated by the community of name which existed even in the primitive times; while they also rely on the difference implied in the very important exception which even Jerome admits, in this very passage—viz., the power of ordaining. The offices of presbyter and bishop, according to the Roman Catholic theory, both, although in different degrees, belong to what Roman Catholics regard as the priesthood of the New Law. This priesthood the bishop possesses in its fulness, the presbyter only in part, but the functions which belong to that part are discharged alike by the presbyter and the bishop, although by the former only in subordination to the latter. What these functions are, will be detailed under the head PRIEST (q. v.); but the principle of a certain distinction of functions, and the limitation of the

power of the presbyter as to one at least—that of ordination—is expressly recognized by Jerome in the passage alluded to. The name presbyter has been retained even in the Roman Catholic theory of a priesthood; but although, by the opponents of the Episcopalian doctrine, the word is used with the express design of excluding the sacerdotal idea, it has come, in the popular language of Roman Catholic theology, to be identical with Priest. From an early period, however, a distinction of rank among the presbyters came into use. Several being, in some cases, attached to a single church, one of the number received the title of *proto-presbyter* or *archi-presbyter*; and it is quite certain this office bore no analogy to that of the bishop.

In all existing Presbyterian churches, a primary element is the representation of congregations in presbyteries, &c., by their delegated elders; of whom the 'minister,' or preaching elder, is always one; and this system of representation is advocated partly on the general ground of the unity of the church, and partly on the special ground of the example of the church in the apostolic age (Acts xv.). The affairs of particular congregations are managed by a court, styled in Scotland the Kirk-session, consisting of the minister, or ministers, if there are more than one, and the other elders, the minister or one of the ministers presiding, but each member having equal power and vote. From the decisions of this court, an appeal lies to the Presbytery, which is usually constituted of the ministers of a certain number of congregations and one 'ruling elder' from each congregation. Further appeals may be taken to *Synods* and *General Assemblies*, in churches so large that for convenience the presbyteries of a district are grouped into a 'Provincial Synod,' and all the provincial synods are subordinated to a General Assembly; but in respect of this there are considerable diversities, and the 'supreme' church court, whether *Synod* or *General Assembly*, is variously constituted by direct representation of each congregation, of each presbytery, or of each provincial synod. Nor are diversities of this kind regarded as in the least degree affecting the principle of Presbyterianism.

Presbyterian churches generally recognize an order of *Deacons* (q. v.) as existing in the church, with power only over its secular affairs; but in many Presbyterian churches this office is merged in that of the elder, and all its functions are exercised by the members of the Kirk-session. A tendency to revive the distinct office of deacon, has, however, been recently manifested in some of the Presbyterian churches.

Some Presbyterians maintain the *divine right of Presbytery*, as the one system of church government authorized by the Word of God; others only maintain that Presbyterianism is *consistent* with the Word of God; whilst many Presbyterians maintain that the Presbyterian system, whatever its imperfections as existing anywhere, is, of all systems that have ever existed in the church, the most agreeable to the principles of church government which may be deduced from Scripture.

Presbyterianism, variously modified, is the form of church government subsisting in many Protestant churches, but is most perfectly developed in Britain and America. In Britain, it prevails chiefly in Scotland, although on the revolution in the 17th c., it was for a very short time in the ascendant in England also. The consistorial system of the continent of Europe (see CONSISTORY) cannot, in any of its modifications, be regarded as essentially Presbyterian, although in some respects it approaches to Presbyterianism. The French consistorial system is more nearly Presbyterian than the German. In other churches, also, Presbyterianism is modified by the relations of the church to the state. At the General Presbyterian Council held at Philadelphia, U.S., in 1880, 44 denominations of Presbyterians in America, Europe, and elsewhere were represented.

PRESBYTERIAN CHURCH IN AMERICA. The first Presbyterians in America were emigrants from Scotland and Ireland. The first Presbyterian congregations in America were organized in Maryland before the close of the 17th c.—the oldest, that of Rehoboth, dating about 1690; and the first presbytery in Philadelphia in 1705. A synod, consisting of four presbyteries, was constituted in 1716. Dissensions ensued; but in 1758 the American Presbyterian churches were united in one; and in 1788 a General Assembly was instituted, the whole number of congregations being then 419, and of ministers 188. The increase of the church was rapid, and in 1834 it contained 22 synods, 111 presbyteries, and about 1900 ministers. In 1801, a scheme of union was adopted between Presbyterians and Congregationalists, under which hundreds of congregations were formed in the state of New York and elsewhere. About the beginning of the present century, the Cumberland Presbyterians (q. v.) separated from the main body; and in 1838, the American Presbyterian Church was divided into two great sections, commonly known as *Old School* and *New School* Presbyterians; the former holding high Calvinistic doctrines; the latter, a somewhat modified Calvinism. Both of these churches are extended over the whole of the United States, and both of them have missions in different parts of the heathen

world, their collections for missions forming a large part of the contributions for that object from the United States of America. For some years, they showed symptoms of a sincere desire to reunite; and this object they accomplished in 1869, notwithstanding the dissensions and new divisions caused by the struggles between the Northern and Southern States on the question of slavery. At the time of this union, the Old School Presbyterians counted 2381 ministers, 2740 churches, and 258,903 communicants; while the New School numbered 1848 ministers, 1631 churches, and 17,563 communicants.

The former possessed at the same time the following theological seminaries: 'Princeton,' 'The Western,' 'Union,' 'Dauville,' and 'Chicago;' and the latter owned the 'Union,' 'Auburn,' 'Lane,' 'Blackburn,' and 'Lind.'—Besides the Cumberland Presbyterians, there are other minor branches of the Presbyterian Church in America, connected with different denominations in Scotland.

PRESBYTERIAN CHURCH IN ENGLAND. The principles of the Puritans (q. v.) were essentially Presbyterian, although many of them were so much occupied with questions of doctrine and discipline, and with resistance to power exercised, as they believed, contrary to the word of God, that they paid little heed to the development of their principles in church government. Yet, in 1572, a presbytery was formed at Wandsworth, in Surrey, by ministers of London and its neighborhood, separating from the Church of England; and other presbyteries were soon formed, notwithstanding the extreme hostility of Queen Elizabeth. When the Westminster Assembly met in 1643, the Puritans of England were generally inclined to adopt Presbyterianism as their system of church government, although some still preferred a modified Episcopacy, and some had adopted the principles of Independency or Congregationalism. The Presbyterians were, however, the strongest party in the beginning of the Revolution, although the Independents gained the ascendancy afterwards. The establishment of Presbyterian church government in the Church of England was voted by parliament (the Long Parliament), 13th October 1647; but it was never really established. The influence of the Independents prevented it. London and its neighborhood were, meanwhile, formed into twelve presbyteries, constituting the Provincial Synod of London, which continued to hold regular half-yearly meetings till 1655, the meetings of presbyteries being continued till a later date; but the whole Presbyterian system was overturned by Cromwell's Committee of Triers, appointed for the examining and approving of all persons elected or nominated to any ecclesiastical office.

Cromwell's policy aimed at bringing all ecclesiastical matters under the immediate control of the civil power. The Restoration was followed by the fruitless Savoy Conference (q. v.), and soon after by the Act of Uniformity, which came into force on 24th August 1662; and on that day, about 2000 ministers in England and Wales resigned their benefices, or submitted to be ejected from them, for conscience' sake. The first Nonconformists (q. v.) were mostly Presbyterians, but a small minority of Independents among them prevented the institution of a regular Presbyterian system, and the consequence was that the Nonconformists of England became in general practically Independent. Antinomianism and Arminianism soon appeared among them, and were followed by Socinianism or Unitarianism to such an extent, that the name *Presbyterian* became synonymous in England with *Socinian* or *Unitarian*; old endowments, legacies of Presbyterians, being in many instances enjoyed by Unitarians. Meanwhile, there existed in England a few congregations connected with the Church of Scotland, and with what was formerly known as the 'Secession Church,' now the United Presbyterian Church. The number of such afterwards very much increased. At the time of the formation of the Free Church of Scotland (q. v.), the greater number of the English Presbyterian churches connected with the Church of Scotland sympathized with the cause of the Free Church, and took the name of the Presbyterian Church in England. In 1876 a union, which had been long desired, was consummated between the synod more intimately related to the Free Church of Scotland and the congregations belonging to the United Presbyterian Church. The name assumed by the united church is the Presbyterian Church of England. At the time of the union, the Presbyterian Church in England had about 150 churches, and the United Presbyterian Church more than 100. At the same date the Church of Scotland in England had about 20 congregations.

PRESBYTERIAN CHURCH IN IRELAND. The Irish Presbyterian Church originated in the settlement of Ulster by Scottish colonists during the reign of James I. After various struggles, a Presbyterian church was founded by the formation of a presbytery at Carrickfergus in 1642. The Presbyterian population of Ulster was greatly increased in number by immigration from Scotland about the middle of the 17th c.; and notwithstanding many difficulties, from the opposition of prelates and of the civil

power, the church continued to increase. It is a curious fact that the Presbyterian ministers received a pension from government, under Charles II., in 1672, which *Regium Donum* (q. v.), however, was not regularly paid until the reign of William, when it was augmented, although only to the paltry amount in all of £1200 a year. It was afterwards repeatedly augmented, till it reached the amount of £70 for each minister. A seminary for the education of ministers was erected at Killaleagh; and in 1710, the synod of the Presbyterian Church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history, the Irish Presbyterian Church experienced the utmost opposition from the *High Church* party. Afterwards, dissensions sprang up within it, and these with reference to the most important doctrines. A body opposed to the doctrine of the Westminster Confession of Faith was organized as the Presbytery of Antrim. But the doctrine of the Westminster Confession was more and more departed from in the Irish Presbyterian Church itself, which became to a large extent Arian or Unitarian. In 1830, a separation took place from the Arians, who then formed the *Remonstrant Synod of Ulster*. In 1840, a union took place of the Irish Presbyterian Church forming the *Synod of Ulster*, and the *Secession Church in Ireland*, an offshoot of the Scottish Secession Church, which then reckoned 141 congregations in the north of Ireland.

The Irish Presbyterian Church now consists of about 600 congregations, and has not only displayed much zeal for the advancement of Protestantism in Ireland, but also of Christianity in other parts of the world, and supports a very successful mission in Guzerat. The act disestablishing the Irish church in 1869, provided also for the discontinuance of the *Regium Donum* to the Presbyterians, with reservation of annuities for life to ministers already entitled to it; and further gave power for commutation of annuities for a capital sum, of which advantage has been taken to a very large extent, so that a fund has been formed for paying annuities and leaving a large surplus as the nucleus of a Sustentation Fund for the ministers in time to come. There are two colleges—one purely theological, at Belfast, with seven professors; the other, at Londonderry, has eight professors and a complete curriculum. The colleges were empowered in 1881 jointly to grant degrees in theology.

PRESBYTERIAN CHURCHES OF SCOTLAND. See SCOTLAND. CHURCH OF; FREE CHURCH OF SCOTLAND; UNITED PRESBYTERIAN CHURCH; &c.

PRE'SBYTERY, the space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir.

PRESBYTERY, in Scotch Law, is an ecclesiastical division of the country, as well as a court. In its local sense, it includes a combination of parishes, varying from 4 to 30. See SCOTLAND, CHURCH OF.

PRE'SCOT, a manufacturing town of Lancashire, 8 miles east of Liverpool. P. has manufactures of watch-tools, watch-movements, small files, &c., and there are potteries near it. Pop. (1881) 6418.

PRESCOTT, WILLIAM HICKLING, LL.D., American historian, son of a distinguished lawyer and statesman, and grandson of Colonel William Prescott, an officer of the Revolution, was born at Salem, Massachusetts, on May 4, 1796. He entered Harvard College in 1811, and graduated in 1814. During his college course, he had one eye blinded by a piece of bread playfully thrown by a fellow-student, and his studies so affected the other, that he was sent abroad for his health, and traveled in England, France, and Italy. On his return to America, he married, and abandoned the study of law for literature. In 1819, he determined to devote ten years to study, and the succeeding ten to composition. He contributed, however, several papers to the *North American Review*, collected in his *Miscellanies*. In 1825, he was engaged in the study of Spanish literature, and selected materials for his *History of Ferdinand and Isabella*. While engaged in this work, his sight failed, and, with the aid of a reader who knew no Spanish, he went through the seven quarto volumes of Mariana's *History*. After ten years of painful labor, his work was made ready for the press, and a few copies struck off for his friends, whose warm approval secured its publication in 1837 (3 vols. 8vo, Boston and London). It met with immediate success, and was translated into French, Spanish, and German. He next devoted six years to the *History of the Conquest of Mexico* (8 vols., 1843, London and New York); and four years to the *Conquest of Peru* (2 vols., 1847). These careful, elaborate, and charmingly written works made for him a high reputation. He was chosen corresponding member of the French Institute; and, on his visit to Europe in 1850, he was received with the highest distinction. In 1855, he published two volumes of his *History of Philip II.*, and a third volume in 1858, but left it unfinished. He died at Boston. January 28, 1859.

Mr. Prescott was an elegant scholar and writer, a man of a cheerful humor and affectionate character, methodical in his habits, and persevering in his pursuits. He walked five miles regularly every day, composing as he walked. He devoted five hours to literary labor, two hours to novel-reading, for the refreshment of his mind—Scott, Dickens, Dumas, and Sue being his favorite authors. He gave one tenth of his ample income in charity, and divided his time between his winter mansion in Boston, a summer residence at Nahant, and a farmhouse, where he spent the autumn. In his large library, with the light carefully regulated for his imperfect vision, he wrote with a stylus each day what he had composed, which was then copied, read over, and carefully corrected. His life, by George Ticknor, was published in 1864.

PRESCRIPTION is the term applied to the written direction or receipt given by the physician or surgeon to the chemist for the preparation of a medicinal substance suitable to a special case. In prescribing, the medical practitioner may either order an *official* or an *extemporaneous* compound. Official compounds (or preparations, as they are frequently termed) are those for which formulæ are introduced into the national pharmacopœias, and are therefore supposed to be always at hand in the laboratory of the dispensing chemist (such, for example, as *Mistura Ferri Composita*, *Pulvis Ipecacuanhæ Compositus*, *Confectio Aromatica*, &c.); while extemporaneous compounds are those which are devised on the instant with the view of meeting the various peculiarities which almost every case of disease presents. 'Too much importance,' as Dr. Paris very truly observes, 'cannot be assigned to the art that thus enables the physician to adapt and graduate a powerful remedy to each particular case by a prompt and accurate prescription. If he prescribes upon truly scientific principles, he will rarely, in the course of his practice, compose two formulæ that shall in every respect be perfectly similar, for the plain reason, that he will never meet with two cases exactly alike.'—*Pharmacologia*, 9th ed., 1848, p. 374.

The author whom we have just quoted, and who is the highest English authority on the subject, lays down *five objects* which the physician should have in view in the construction of an extemporaneous formula or prescription. They are: 1. To promote the action of the principal medicine (or, as he terms it, the basis) of a formula. 2. To correct the operation of the basis. 3. To obtain the joint operation of two or more medicines which act in totally different ways. 4. To obtain a new and active remedy not afforded by any single substance. 5. To select an eligible form. The *first object* may be attained (a) by combining different preparations of the same substance, as, tincture of senna with infusion of senna in the ordinary Black Draught; or (b) by combining different substances of a similar action, as, for example, opium with hyoscyamus or conium; or sulphate of magnesia with the preparations of senna; or quinine with the preparations of iron. The *second object* may be obtained in various ways. For example, the addition of extract of hyoscyamus to the compound extract of colocynth renders the purgative action of the latter much less griping, but not less efficacious; the addition of dilute sulphuric acid to a solution of sulphate of magnesia renders that purgative salt less liable to gripe, and makes it sit easier on the stomach; and extract of elaterium, if given in hot brandy and water, acts equally powerfully as a hydragogue cathartic without causing the depression of the vital powers, which it often occasions if given alone. As an illustration of a mode of attaining the *third object*, we may refer to the operation of purgatives and of diuretics.

If we administer a purgative which acts mainly in increasing the peristaltic motion of the intestines, their contents will be urged forward and evacuated, but the operation will be slow and difficult, and probably be accompanied with griping; but if we combine this medicine with one which acts by increasing the flow of fluids into the intestine, the purgative action will be increased and quickened, and all griping will be avoided. A combination of foxglove, squill, and blue pill or calomel will act much more powerfully as a diuretic than any one of the substances taken alone; and they probably all act in different ways on the system. The *fourth object* is usually attained by chemical decomposition. The activity of the *Mistura Ferri Composita* is due to the carbonate of iron which it contains, and which is yielded by the double decomposition of the two ingredients of the mixture, sulphate of iron and carbonate of potash. By prescribing a mixture of solution of iodide of potassium and corrosive sublimate, we obtain an extemporaneous formation of biniodide of mercury. The Black Wash (see LINTMENTS) owes its active ingredient to the decomposition of calomel by lime-water. In some cases, where no chemical action is apparent or probable, a mixture of two or more drugs seems to modify the physiological effect of each ingredient. For example, Dover's Powder contains as its active ingredients ipecacuanha and opium, and yet in well-regulated doses it neither exhibits the nauseating properties of the former, nor the narcotic influence of the latter substance. The *fifth object*, the selection of

the most eligible form of the remedy, is of extreme importance. The physician here has to determine whether he shall prescribe his remedy in the form of pill, powder, or mixture; whether he shall administer it as an injection into the lower bowel; whether the patient shall (in certain cases) inhale it; &c.

As a general rule, we should accommodate the form and flavor of our remedies, provided we do not sacrifice their virtues, to the taste of the patient, who usually prefers pills to draughts or powders. The unpleasant taste of many medicines which must be given in the fluid form may often be obviated by the skill of the prescriber. Castor oil, cod-liver oil, and copaiba are most easily taken on the surface of orange wine, or water containing a bitter tincture, care being taken to moisten with water the edge or rim of the glass at the part applied to the mouth. The taste of solution of potash and of lime-water is best covered with milk; and the disagreeable flavor of senna is said to be concealed if its infusion is made with strong tea.

In conclusion, it may be remarked that in this country it is the custom to write prescriptions in the Latin language, to abbreviate well-known words, to use symbols for weights and measures, and to commence each prescription with the symbol *R*, which signifies *Recipe*, take. As an illustration, we append a prescription for a tonic draught:

(Name of Patient.)

R. Infus. Calumbæ,	f. 3ix
Tinct. Calumbæ,	f. ʒi
Acid. Sulph. Dilut.,	℥x
Syrup. Aurant.,	f. ʒiiss

M. Fiat Haustus ter quotidie sumendus.

Date (in Latin).

(Initials or name of prescriber.)

PRESCRIPTION, in Law, is the limit of time within which one may acquire certain legal rights, by reason of the want of vindication by some other person of such rights and putting in force his legal remedies. In England, however, it has a limited meaning, confined to a certain class of rights relating to lands, such as rights of way, of water-course, of fishing, shooting, &c.; while in Scotland, it is a general term, applicable to all legal rights and to real property; and hence prescription in Scotland corresponds to prescription, *plus Limitation* (q. v.), in England. Prescription in England is thus a mode of acquiring a legal right, incident to land, by the mere force of claiming and exercising it, without dispute, for a certain length of time. Thus, if a neighboring owner has for 30 years, without interruption, actually enjoyed a right of common, such as pasture, fishery, shooting, &c., over another's lands, he will be entitled to it as a legal right for ever after, unless in certain exceptional cases; and if he has enjoyed it for 60 years, his title for ever after cannot be defeated. So, if a person has for 20 years enjoyed, without interruption, a right of way, or of watercourse, or of watering cattle, and similar Easements (q. v.) on another's lands, he will be entitled, for ever thereafter, to enjoy these, except in a few exceptional cases; and if the enjoyment has been for 40 years, he is entitled in all circumstances. So, if a person whose house adjoins another's lands, and whose windows open upon such land, has enjoyed the light coming to these windows for 20 years, he can for ever thereafter prevent his neighbor from building on his land, and thereby darkening such lights. In Scotland, prescription includes such rights as have been already mentioned, and also the other substantive rights of property. With respect to servitudes, such as right of way, water-course, fuel, feal, and divot, the right can be gained by the enjoyment for 40 years. Prescription is divided into positive and negative.

By the positive prescription, whenever one enjoys lands for 40 years, and can show an infeftment, or a series of infeftments, during such time, though no previous title at the commencement of such period, such person obtains a right to the property. This enactment applies to all kinds of heritable subjects, including leases and servitudes, which require no infeftment, and as to which mere possession for 40 years, without interruption, will give the right. By the negative prescription of 40 years, rights are cut off, unless sued for within that period as a debt due on a heritable bond, and on all contracts whatever. Servitudes are also lost by the lapse of 40 years without enjoyment. Besides these prescriptions, there are others, called the lesser prescriptions. Thus, there is a 20 years' or vicennial prescription, applicable to certain written contracts; a ten years' or decennial prescription, applicable to actions against tutors and curators; a seven years' or septennial prescription, applicable to actions against cautioners; a sexennial or six years' prescription, applicable to actions on bills of exchange; a quinquennial or five years' prescription, applicable to actions for arrears of rent and verbal contracts; a three years' or triennial prescription, applicable to actions on ordinary merchants' accounts, for servants' wages, rent due on a verbal lease, and for work done by work-

men, attorneys, &c. With regard to crimes, also, in Scotland, but not in England, a 20 years' prescription applies, and no prosecution is competent after that period.

PRESENTATION, the name of the act by which a patron of a living in the Established Church of Scotland appointed a minister; so called because the presentee had to be presented to the presbytery for inquiry into his qualifications, and for induction, if these were satisfactory. If the patron failed to present within six months, the right then devolved on the presbytery. When a presentee was objected to by the major part of the congregation, whether with or without reason, the General Assembly of the church formerly claimed the right to declare that he should not be inducted or entitled to the benefice. This declaration was contained in an act of Assembly, dated 1835, called the Veto Act. But after much litigation, it was decided by the courts of law that such Veto Act was *ultra vires* and void; and this decision led to a secession of many ministers and people from the Established Church, and to the formation of a new dissenting church, called the Free Church (q. v.). It was then settled by law that it was the presbytery, not the congregation, who were to consider all objections to the presentee, mere dislike on the part of the people not being a ground of rejection. In 1874, however, an act of parliament was passed by which patronage was abolished, and the right of choosing their minister transferred to the congregation. See **PATRONAGE**.

PRESE'NTMENT is, in English Law, the formal representation made by a grand-jury of the finding of an indictment; by churchwardens to the ordinary of the state of the parish; by the Court of Quarter Sessions of the fact of the disrepair of a bridge, &c. Presentment, with reference to bills of exchange, is the formal demand made by the creditor to the debtor, who is primarily liable, calling upon him to accept the bill or to pay it. If the bill is not paid, then notice of dishonor must be sent to the other parties secondarily liable, who are then bound. See **BILLS OF EXCHANGE**.

PRESERVES, PRESERVED PROVISIONS, &c. Much variety is comprehended under these terms: the first is generally understood to mean fruits preserved with sugar or brandy; and the latter, such articles of animal or vegetable food as are used ordinarily, but which are preserved by any means for the convenience of carriage, and for use beyond the time they would remain uninjured by ordinary keeping. Fruits intended for confectionery are preserved in four different ways: First, They may be preserved in the form of jam, in which the fruit is simply boiled with from one-half to equal its weight of sugar. By this method, the fruit becomes broken, and the juice set free; but all is preserved, as the latter forms a thick syrup with the sugar. Such preserves can be kept, if well made, for several years, but are best used during the first winter. A second plan is to preserve only the juice, which, when carefully strained from the solid portions of the fruit, and boiled with a third or half its weight of refined sugar, constitutes the fruit-jellies of the cooks and confectioners. Another method is called candying, and consists in taking fruits whole or in pieces, and boiling them in a clear syrup previously prepared. In this way, they absorb the syrup, and are then dried by a gentle heat, which causes the sugar of the syrup to crystallize on the surface and through the substance of the preserved fruits, which retain their form, and much, if not all of their color. The remaining method is to carefully stew them in a weak syrup of refined sugar and water, so that they are rendered soft, but are not broken. They are then transferred, with the syrup, to jars with well-prepared covers, to prevent evaporation; and pale brandy, equal in quantity to the syrup, is added. As a rule, only stone-fruits, such as peaches, plums, and cherries, are preserved in this way. Several fruits and vegetables, such as olives, cucumbers, cabbage, &c.; are preserved for food in a saturated solution of salt and water poured in hot; others, in vinegar. See **PICKLES**.

But the most approved methods of preserving vegetable and animal substances for food-purposes, so as to be used as nearly as possible as if they were in the fresh state, is either to desiccate them, or to seal them in air-tight cases. The first method was introduced by M. Chollot of Paris in 1852, and patented in England in 1854. It was, and still is, chiefly applied to vegetables, and a few kinds of fruit, such as apples and pears, which have a small amount of juice. By his method, M. Chollot entirely removes all moisture from the vegetables, by drying either in a vacuum or by the aid of heated air, which reduces their bulk more than one-half. They are then compressed under powerful presses, which, besides rendering them extremely portable, also makes them less liable to absorb moisture from the atmosphere, which is very desirable, as they are very absorbent. In this way, both the color and distinctive flavor of the vegetables are completely preserved, and mere soaking in water restores them almost precisely to their original condition. The introduction of this

process has been of great benefit to voyagers, as it enables ships to carry a complete supply of vegetable provisions on the longest voyage.

The method of sealing cooked provisions in air-tight metallic cases, which is now so largely in use, is of comparatively recent invention, and has only been brought into use during the present century. In 1810, Augustus de Heine took out a patent in this country for preserving food in tin or other metal cases, by simply exhausting the air by means of an air-pump; but it was unsuccessful. It was followed by a number of others by various persons, all of which were more or less failures, until Wertheimer's patents, which were three in number, from 1839 to 1841. By his plan, the provisions of whatever kind are put into the metal cases, and closely packed, and the interstices filled in with water or other appropriate liquid, such as gravy in the case of flesh-food. The lids are then soldered on very securely; two small perforations are made in each lid, and the cases are set in a water-bath, in which muriate of lime is dissolved, and heat is applied until the whole boils, and the air is expelled through the small openings in the lids of the cases. When this is complete, the small holes are quickly soldered up, and the tins are removed from the bath.

The muriate of lime is used because its solution can easily be maintained at a heat of 270° to 280° Fahr., without material evaporation. Other plans have been patented similar in principle, but varying in the mode of applying it. A large business of this kind has for several years been successfully carried on by John Gillon & Co., Leith, and by Moir, Aberdeen, whose cases of preserved meats and soups are well known as an article of commerce. The imports of tinned meats from Australia and New Zealand are now extensive, and are yearly increasing. A very ingenious and scientific plan for preserving meat fresh was invented by Professor George Hamilton of Cheshire. It consists in cutting the meat small, and putting it into jars of binoxide of nitrogen, which perfectly preserves its sweetness and ordinary appearance. This plan has been tried with success on a small scale, and was shown in the Paris Exhibition of 1855 as a French discovery, although Professor Hamilton's paper was in Paris in 1854. The fresh meat of late so largely imported from America, may be said to be preserved, as it is kept fresh—not frozen—by being packed in chambers cooled by the presence of large quantities of ice. See **PRESERVES**.

In addition to the methods described, we have to notice here some recent efforts to preserve animal food. As yet the most successful method is by placing it when boiled in tins of convenient size for household consumption, hermetically sealed from the air. The waste of animal food in Australia and America had long been a cause of regret, and the sending of it to Europe in a dried state was only partially attempted, when the plan of preserving it in a boiled condition was first tried, on any scale, in 1866 or 1867. Since then, the quantity of Australian and American mutton and beef from Australia and the United States consumed in Great Britain has increased very rapidly. In 1872, the total value of the imports of unsalted meats was not far short of a million sterling. In 1880 the value of the imports of meat, salted, fresh, or otherwise preserved, was over two millions sterling. Of this a value of £1,428,563 was for meat from the United States.

The eminent chemist Liebig suggested the manufacture of a concentrated extract of meat; and this is now carried on very extensively both at home and abroad. It is chiefly used by invalids, and for quickly making soups. Only the lean or muscular part is used, and this boiled until all but the fibrin is dissolved out; the liquid is then concentrated until it is brought to the state of a thick paste, in which state it is easily preserved. Much controversy has of late taken place concerning the nourishing properties, not only of Liebig's, but of all meat extracts. Still those physiologists who have least to say in their favor, do not deny that they have some useful properties as food, and their use is decidedly on the increase. The Liebig Extract of Meat Company is said to have slaughtered, in the year 1872, 150,000 head of cattle.

A few years ago, Professor Redwood patented a method of preserving fresh meat by a coating of paraffin; but this substance, from its brittleness, is apt to crack, and we are not aware that it is now in use. Signor Mariotti has patented a rather peculiar plan, which consists in carbonizing the whole surface of the meat by taking advantage of the high temperature of boiling fat into which it is dipped. No way of preserving animal food fresh, however, excels the simple one of storing it in chambers or cabins at a temperature as little as possible above the freezing-point. By this method large supplies of fresh meat have been conveyed to this country from the United States and Canada in steamers fitted up for that purpose. The value of the beef alone thus imported amounted in 1880 to £1,889,730.

Two large companies, an English and a Swiss, have been lately formed for the supply of condensed milk, and also coffee and cocoa mixed with it and sugar, in such a way as to be ready for

use with the addition of boiling water. Coffee so prepared is at present very much in demand.

PRESSES OF MEETING, a name given in Scotland to the chairman of a meeting, who is often popularly believed to have some mysterious power or authority; but in point of fact, he has no more power than any other person present, and is merely for convenience, used as a mouthpiece for putting questions and amendments to ascertain the will of the majority. In meetings of creditors under the Bankrupt Act, a presser requires to be elected before any business is done; but his power is confined to that of constituting the meeting, and preserving order, so far as the creditors mutually agree to obey his suggestions. As a general rule, a presser, or chairman, has only a single vote, like other persons, and not a casting vote, unless where some act of parliament expressly gives it to him, according to the nature of the meeting held.

PRESS, FREEDOM OF THE, the expression used to denote the absence of any authorized official restraint on publication. The press is an instrument well adapted for disturbing the functions of government, and committing injuries against reputation; and when its power as a political engine was first discovered, the European governments took it into their own hands, no one being allowed to print any work till it had obtained the sanction of the proper authorities. The clergy also, on behalf of the papal hierarchy, claimed a share in the censorship, where questions of religion was concerned. In England, at the Reformation, the control of the press came to be more completely centred in the crown than elsewhere, the ecclesiastical in addition to the secular department being vested in Henry VIII. as temporal head of the church. The Company of Stationers, who came to have the sole right to print, were servants of the government, subject to the control of the Star Chamber, the censorship of the press was enforced by the Long Parliament, and was re-established more rigorously at the Restoration. It was continued at the Revolution, and the statute regulating it was renewed from time to time till 1693, when the Commons, by a special vote, struck it out of the list of temporary acts to be continued. Since that time, the censorship of the press has ceased to exist in Britain. But though there are no official restrictions on what shall and what shall not be published, the authors and publishers of criminal or injurious matter are amenable to the law of libel; and there are certain statutory requirements in force to enable them to be traced. The existing statutes which apply to all printed publications are 39 Geo. III. c. 79, amended by 51 Geo. III. c. 65, 2 and 3 Vict. c. 12, and 32 and 33 Vict. c. 24.

Every person who prints anything for hire or reward must, under a penalty of £20, keep one copy at least of the matter printed, and write on it the name and place of abode of the person who employed him to print it. By statute 2 and 3 Vict. c. 12, every person who shall print any paper meant to be published, must print, on the first or last leaf, his name and usual place of business; and on failure to do so, he forfeits the sum of £5, and so does any person publishing the same. There are a few printed papers exempted from conforming to the above requirement—as for instance papers printed by parliament or in government offices, engravings, auction lists, bank-notes, bills of lading, receipts for money, and a few other similar matters. In the case of a libel, legal publication is constituted by the sending of a copy printed or in manuscript to a man, and the sale of a newspaper or other publication in a shop, or its delivery to an officer at the Stamp-office, is also considered an act of publication. The truth of the statements published may be urged as a plea of defence in an action for libel, but only on the ground of its publication being calculated to promote the public interest. See **LIBEL**. The existing statutes affecting newspapers are 2 Geo. IV. and 1 Wil. IV. c. 73, 6 and 7 Wil. IV. c. 76, and 32 and 33 Vict. c. 24. If a bill shall be filed in any court for the discovery of the name of the printer, publisher, or proprietor of a newspaper or other publication, with a view of rendering him liable in damages for slanderous matter, the defendant is bound to make the discovery required, which, however, cannot be made use of against him in any other proceeding than that for which it has been made. The penalties against newspapers can only be sued for in the name of the Attorney-general or Solicitor-general, or Lord Advocate. Certain regulations also exist regarding the exhibition of plays, for which see **Laws as to THEATERS**. Subject to these restrictions, the freedom of the press has subsisted in Britain since 1693.

A more or less rigorous censorship of the press exists in most European states. There is often no direct supervision previous to publication, but the official censor has it in his power to stop any publication which he deems objectionable, to confiscate the edition, and to prosecute the author and editor. Newspapers and pamphlets are generally subjected to a stricter censorship than larger works.

PRESSING TO DEATH. See **PEINE FORTE ET DURE**.

PRESSIRO'STRES, a tribe of birds of the order *Grallatores*, distinguished by a bill of moderate size, not so strong as in the

Cultrirostres; whilst the hind toe is either wanting, or so short as not to touch the ground. To this tribe belong bustards, plovers, lapwings, oyster-catchers, &c.

PRESSITI'SSIMO (Ital. very quick) is the most rapid degree of movement known in musical composition.

PRESTER JOHN. See **JOHN, PRESTER**.

PRE'STO (Ital. quick), in Music, a direction that a piece should be performed in a rapid lively manner.

PRE'STON, an important manufacturing and market town, a municipal and parliamentary borough in Lancashire, on the north bank of the Ribble, and at the head of the estuary of that river, 27 miles north-north-east of Liverpool. It occupies an eminence 120 feet above the Ribble, and it covers an area 2 miles square. The houses are mostly built of brick, and the town is on the whole well laid out, and is surrounded with pleasing scenery. The river is crossed by two bridges and several railway viaducts. There are 14 churches, 7 Catholic and 20 other dissenting chapels. The chief public buildings are the Town-hall, of Gothic design, which contains the Guild-hall and Exchange, and was erected at a cost of upwards of £60,000; the Preston and County of Lancaster Royal Infirmary, erected 1869; the Corn Exchange and market-house; the House of Correction and court-house; the Institution for the Diffusion of Useful Knowledge, with a library of 10,000 volumes; the Institute and School for the Blind. It has also several public libraries; 2 weekly and 2 semi-weekly newspapers. Linen manufactures were formerly the staple, and though still extensive, have been supplanted by the cotton manufacture, which now holds the first place. P. contains in all about 90 cotton-mills, which give employment to about 27,500 hands. There are also iron and brass foundries, iron ship-building yards, carriage-works, and machine-shops; and malting, brewing, and rope-making are also carried on. P. is a free port, and is reached at spring-tides by vessels drawing 14 feet. In 1880, 255 vessels of 17,348 tons entered and cleared the port. Its imports are chiefly corn, iron, and timber; its exports principally coal.

Four great fairs are held here during the year, besides the usual weekly markets. The celebrated guild of merchants, called Preston Guild, is still observed here every 20 years. On the last occasion, 1862, the foundation stone of the new Town-hall was laid. It is about 700 years since the guild merchant of Preston was acknowledged by royal charter. The first of its 14 royal charters was granted in the reign of Henry II. Preston alone has kept up the celebration of its guild to the present day. The borough returns two members to the House of Commons. Pop. (1881) 93,707.

PRESTONPA'NS, a village of Haddingtonshire, having a station on the North British Railway, $8\frac{1}{2}$ miles east of Edinburgh. It is supposed to have had salt-pans as early as the 12th c., and possessed thriving manufactures till some time after the Reformation. Its present manufacturing industry is limited to that of ale. Pop. (1881) 2265. Near P. was fought the famous battle of that name, in which the Jacobites under Prince Charles Edward completely routed the royal army under Sir John Cope, capturing their cannon, baggage, and military chest.

PRESTWICH, a cotton manufacturing village and township of Lancashire, 4 miles N.W. from Manchester. It has a fine old Gothic church, built in the 18th c., and restored in 1861, also a large county lunatic asylum, erected in 1861. Pop. (1881) 8627.

PRESUMPTION is an inference drawn by the law in certain circumstances or conditions of fact, and is used generally as a mere starting-point in an argument or litigation. Presumptions are often divided into *presumptio juris* and *presumptio juris et de jure*. The former serves as a mere starting-point, and may be rebutted by proof to the contrary. Thus, a person who has possession of goods, is presumed to be the owner till the contrary is proved. A man is presumed to be innocent until the contrary is proved. A *presumptio juris et de jure* is said to be a presumption which cannot be rebutted; but there are few instances of this. Presumptions abound in all departments of the law, and are adopted from the necessity of coming to some conclusion or other in most cases where the evidence is general or inconclusive. Thus, a common illustration is where two persons are drowned at sea, and legal rights depend on the fact which of them survived the other. In such a case, it is presumed by the law of some countries, that the younger person survives; but there is no presumption in England. But in case of mother and child dying during delivery, the presumption is that neither survived. If a person disappear, and is not heard of, he is presumed to be living. But by an act of parliament this presumption was put an end to, or at least was not allowed to interfere with the right of a married woman to consider herself a widow, after her husband has left her, and has not been heard of for seven years.

PRETENCE, ESCUTCHEON OF, or ESCUTCHEON SURTOUT, in Heraldry, a small shield placed in the center of the field of another shield. The husband of an heiress may bear the

arms of his wife in an escutcheon of pretence, instead of impaling them. Feudal arms are also sometimes placed on an escutcheon of pretence, particularly in the insignia of elective sovereigns, who have been in use of bearing their own proper arms in surcoat over those of the dominions to which they are entitled. The crown of Charlemagne is placed in surcoat in the arms of Hanover; and from 1801 till the accession of Queen Victoria, the Hanoverian insignia occupied an escutcheon of pretence in the center of the royal arms of the United Kingdom.

PREVEZA, or PREVISA, a busy trading town on the north shore of the strait which forms the mouth of the Gulf of Arta. The Berlin Congress included P. in the part of Epirus to be restored to Greece; but at the rectification of the frontier in 1881 it was retained by Turkey, it being arranged that the fortifications should be destroyed. Pop. 8000.

PREVOST-PARADOL, LUCIEN ANATOLE, a distinguished French littérateur, born at Paris, 8th August, 1829, studied at the Collège Bourbon and the Ecole Normale; in 1851, obtained from the Académie the prize for eloquence, and was admitted Docteur-ès-lettres in 1855. In that year, he was named to the chair of French literature by the Faculty of Aix; but in the following year resigned it, and became one of the editors of the *Journal des Débats*, writing generally the leading articles. His advocacy of a responsible ministry brought him into difficulties with the censorship. He was twice an unsuccessful candidate for a seat in the Chamber. In 1865, he was elected a member of the Académie. Believing that the Empire had at last adopted the principle of parliamentary government, he consented, in 1870, to fill the post of envoy at Washington; but undeceived by the events connected with the proclamation of war with Prussia, he died by his own hand, 20th July 1870. His chief works are—*Revue de l'Histoire Universelle*, 1854; *Essais de Politique et de Littérature*, 1859-63; *Quelques Pages de l'Histoire Contemporaine*, 1862-66.

PRIAM, king of Troy at the time of the Trojan war, was the son of Laomedon, and Strymo or Placia. The name P. (derived from *Priamati*, to ransom) was given him on account of his having been ransomed by his sister Hesione from Herakles, into whose hands he had fallen. His first wife was Arisbe, daughter of Merops, whom he gave away to a friend in order to marry Hecuba, by whom, according to Homer, he had nineteen sons; but as his intercourse with the other sex was not limited to Hecuba, the epic poet gives him in all 50 sons; while later writers add as many daughters. The best-known of these are Hector, Paris, Deiphobos, Helenus, Troilus, and Cassandra. P. is represented as too old to take any active part in the Trojan war; and in Homer, only once appears on the field of battle. The oldest Greek legends—i. e., the Homeric, are silent respecting his fate; but the later poets—Euripides, Virgil, &c.—say that he was slain by Pyrrhus at the altar of Zeus Herkeios, when the Greeks stormed the city.

PRICE, RICHARD, was born at Tynton, in Wales, on 22d February 1723. His father, Rice Price, was a dissenting minister possessed of some wealth, and remarkable for his intolerance. A leading characteristic of his son's mind, on the other hand, was the calm resolution with which, from his youth, he declared his own opinions, and advocated freedom of thought for others. He declined to bend his convictions to paternal authority; accordingly, on his father's death, Richard was so poorly provided for, that, having resolved to prosecute his studies in London, he was obliged to make the journey chiefly on foot. He obtained admission to a dissenting academy, where he acquired a good knowledge of mathematics, philosophy, and theology. At the end of four years, he engaged himself as chaplain to a Mr. Streatfield, with whom he lived for thirteen years. Mr. Streatfield, on his death, left P. some property; and his circumstances having been further improved by the death of an uncle in 1757, he was enabled to carry out a matrimonial engagement which he had formed with a Miss Blundell.

He then settled as a preacher at Hackney; but being shortly afterwards chosen minister at Newington Green, he removed to that place, where he lived till the death of his wife in 1786, when he returned to Hackney. Meanwhile, his life had been one of considerable literary and scientific activity. His *Review of the Principal Questions and Difficulties in Morals* (Lond. 1758), though a somewhat heavy work, established his reputation as a metaphysician and a moralist. In 1769, the degree of Doctor of Divinity was conferred on him by the university of Glasgow. In the same year, he published his *Treatise on Reversionary Payments*; this was followed by the compilation and publication of the celebrated *Northampton Mortality Tables*, and various other works relating to life-assurance and annuities, forming most valuable contributions to the branch of science to which they refer. In 1776, appeared his *Observations on Civil Liberty and the Justice and Policy of the War with America*. Of this work, 60,000 copies are said to have been sold in a few months. So greatly was it admired in the United States, that, in 1778, the American Congress, through

Franklin, communicated to him their desire to consider him a fellow-citizen, and to receive his assistance in regulating their finances; an offer declined principally on the ground of age. He died April 19, 1791. P. was a believer in the immateriality of the soul holding that it remained in a dormant state between death and resurrection. Their difference of opinion on this subject led to a controversy of some celebrity between him and his friend Dr. Priestley. His views respecting the Son of God were what is called Low or semi-Arian. His moral character appears to have been a singularly beautiful one. 'Simplicity of manners,' says Dr. Priestley, 'with such genuine marks of perfect integrity and benevolence, diffused around him a charm which the forms of politeness can but poorly imitate.' See *Memoirs of the Life of Richard Price, D.D.*, by William Morgan, F.R.S., Lond. 1815.

PRICHARD, JAMES COWLES, a distinguished ethnologist and physician, was born at Ross, in Herefordshire, on the 11th of February 1786. His father, Thomas Prichard, a member of the Society of Friends, and a merchant, had been married young, and was early left a widower with four children, upon whose education he bestowed the greatest care. Of these children, James Cowles, the eldest, was educated at home under private tutors. He learned Latin and Greek from a Mr. Barnes; French from an *émigré* named De Rosemond; and Italian and Spanish from an Italian named Mordenti—while his father himself taught him history, for the study of which young P. showed a strong predilection. At Bristol, where his father resided for some time in the pursuit of his business, the embryo ethnologist gave the first indications of his love for the study in which he afterwards became famous. On the quays, he met with foreigners from every country, and took much interest in observing their physical appearance, occasionally conversing with the sailors and others, as well as he was able, in their native tongues. On retiring from business, his father again took up his abode at Ross, where the son continued to pursue his studies under private tutors. When the time for choice of a profession arrived, young P. chose that of medicine as the one he thought most akin to his ethnological pursuits. He accordingly became a student of medicine, first at Bristol, afterwards at St. Thomas's Hospital, London, and finally at Edinburgh, where he took his degree of M.D. Before commencing practice, however, he entered himself a student at Trinity College, Cambridge, where he read mathematics and theology for the most part. Subsequently, he studied at St. John's College and Trinity College, Oxford.

In 1810, he commenced practice in Bristol as a physician. His talents were soon recognized, both privately and publicly. He was first appointed physician to the Clifton Dispensary and St. Peter's Hospital, and afterwards physician to the Bristol Infirmary. In 1813, he published his first work, *Researches into the Physical History of Mankind*, which at once gave him a high standing as an ethnologist. Of this, a second and enlarged edition, in two vols., appeared in 1826; and a third, still further improved and enlarged, in five vols., appeared between the years 1836 and 1847. The second and third editions of this work, each in succession, gave remarkable proofs of the extraordinary zeal with which Dr. P. pursued his ethnological investigations; and not only so, for at the same time he devoted himself much to the pursuit of philology, which he rightly judged to be absolutely necessary to an enlarged study of ethnology. In a few years, he became acquainted, not only with the Teutonic and Celtic languages, but with Sanscrit, Hebrew, and Arabic; showing a practical result of his studies in the publication of his work entitled *The Eastern Origin of the Celtic Nations*. In this publication, which appeared at Oxford in 1831, he compared the different dialects of the Celtic with the Sanscrit, Greek, Latin, and Teutonic languages, and succeeded in proving a strong affinity between them all, from which he argued in favor of a common origin for all the peoples speaking those languages. His theory has met with general acceptance; and the work in which it appeared, says Mr. Norris, 'is admitted by the most distinguished philologists to be unsurpassed in ability and soundness, while not a few deem it to be that which has made the greatest advance in comparative philology during the present century.' A previous work—namely, his *Analysis of Egyptian Mythology*, first published in 1819, had the honor of being translated into German in 1837, and edited by A. W. Schlegel, who, however, took occasion to dissent from some of the author's views.

In 1843, Dr. P. published the first edition of his *Natural History of Man*, in 2 vols. Two other editions of this work appeared during the author's lifetime; and a fourth, ably edited and enlarged, by Mr. Edwin Norris, was given to the world in 1855. Dr. P.'s other published works are for the most part on medical subjects—namely, *History of the Epidemic Fevers which prevailed in Bristol during the years 1817, 1818, and 1819*, published in 1820; *Treatise on Diseases of the Nervous System* (1822); *A Treatise on Insanity and other Diseases affecting the Mind* (1835); and *On the Different Forms of Insanity in Relation to Jurisprudence* (1842). He also

contributed various articles to the *Cyclopædia of Practical Medicine* and to the *Library of Medicine*. As a tribute to his eminence as an ethnologist, Dr. P. was elected President of the Ethnological Society; while, in recognition of his researches into the nature and various forms of insanity, he received the government appointment of Commissioner in Lunacy. This occasioned his removal from Bristol to London, where, unfortunately for the interest of science, he expired of rheumatic fever, on the 22d of December 1848, at the comparatively early age of 62. Dr. P.'s fame as the greatest of ethnologists, which, during his lifetime, was universally acknowledged, remains undisturbed to this day, notwithstanding any difference of opinion as to his favorite doctrine of the unity of the human race, which he constantly upheld. He was the first to raise ethnology to the rank of a science, and in his work, *The Physical History of Mankind*, he has left behind him a noble monument of his genius, skill, and perseverance.

PRICKLE (*Aculeus*), in Botany, a strong and hard, elongated and pointed hair. See **HAIRS**, in *Botany*.—The prickle is connected only with the bark, and not with the wood, in which it essentially differs from the spine or thorn. Prickles are sometimes straight, sometimes curved. They have often a pretty extended base—of some definite shape—by which they are attached to the bark.

PRICKLY HEAT is the popular name in India and other tropical countries for a severe form of the skin-disease known as *Lichen*. It more frequently attacks strangers from temperate climates than the natives, although the latter are not altogether exempt from it. The sensations of itching and stinging which attend it are intense, and give rise to an almost irresistible propensity to scratching, which of course only aggravates the irritation. Little or nothing can be done in the way of treatment, except keeping as cool as possible; but the remedies recommended in the article **LICHEN** may perhaps slightly alleviate the symptoms.

PRICKLY PEAR, or **INDIAN FIG** (*Opuntia*), a genus of plants of the natural order *Cactaceæ* (q. v.), having a fleshy stem, generally formed of compressed articulations, sometimes of cylindrical articulations; leafless, except that the youngest shoots produce small cylindrical leaves, which soon fall off; generally covered with clusters of strong hairs or of prickles; the flowers springing from among the clusters of prickles, or from the margin or summit of the articulations, solitary, or corymbose-paniculate, generally yellow, rarely white or red; the fruit resembling a fig or pear, with clusters of prickles on the skin, mucilaginous, generally eatable—that of some species pleasant, that of others insipid. The fruit imparts a red color to the urine. The prickles of some species are so strong, and their stems grow up in such number and strength, that they are used for hedge-plants in warm countries.

The **COMMON P. P.** or **I. F.** (*O. vulgaris*), a native of Virginia and more southern parts of North America, is now naturalized in many parts of the south of Europe and north of Africa, and in other warm countries. It grows well on the barest rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. It is of humble growth; its fruit oval, rather larger than a hen's egg, yellow, and tinged with purple, the pulp red or purple, juicy, and pleasantly combining sweetness with acidity. It is extensively used in many countries as a substantive article of food. In the south of England, the P. P. lives in the open air, and occasionally ripens its fruit. In America, it is cultivated considerably to the north of its native region. Lime rubbish is often mixed with the soil in which it is to be planted. The fruit is imported into Britain, to a small extent, from the Mediterranean.—The **DWARF P. P.** (*O. nana*), very similar, but smaller, and having prostrate stems, is naturalized in Europe as far north as the sunny slopes of the Tyrol.—The **TUNA** (*O. tuna*), much used in some parts of the West Indies as a hedge-plant, and also valuable as one of the species which afford food to the cochineal insect, yields a pleasant fruit. It has red flowers, with long stamens, which display a remarkable irritability.

PRIDE, in Heraldry. A peacock, or other bird, when the tail is spread out in a circular form, the wings dropped, it is said to be 'in his pride.'

PRIDEAUX, HUMPHREY, an English scholar and divine, was born of an ancient and honorable family at Padstow, in Cornwall, May 3, 1648. He was educated first at Westminster School, under Dr. Busby; and afterwards at Christ Church, Oxford, where he took the degree of B.A. in 1672. In 1676, he published an account of the Arundellian Marbles, under the title of *Marmora Owonensia*, which greatly increased his fame as a scholar, and in the following year, took the degree of M.A. The *Marmora* procured for P. the friendship of the Lord Chancellor Finch (afterwards Earl of Nottingham), who, in 1679, appointed him rector of St. Clement's at Oxford, and, in 1681, a prebendary of the cathedral of Norwich. After several minor preferments he was collated, in 1688, to the archdeaconry of Suffolk; and in 1702,

was made Dean of Norwich. He died November 1, 1724. His principal works are, his *Life of Mahomet* (1697), which was long very popular, and has gone through many editions, but is now entirely superseded; and *The Connection of the History of the Old and New Testament* (1715–1718). The last of these treats with much learning, but less discernment, the affairs of ancient Egypt, Assyria, Persia, Judea, Greece, and Rome, as far as they bear on the subject of sacred prophecy. P. was a zealous but not an intolerant churchman, most conscientious in the discharge of his own duties, equally anxious that others should do theirs, and possessed of a considerably greater share of piety than was usual in his age.

PRIE'GO, a town of Andalusia, Spain, 45 miles S.E. of Cordova. There are oil-mills, flour-mills, tanneries, and potteries. There were formerly very important silk manufactures. Pop. (1877) 15,674.

PRIESSNITZ, VINCENT, the founder of Hydropathy (q. v.), was born at Gräfenburg (q. v.), in Austrian Silesia, October 5, 1799. He was the son of a peasant-proprietor, and received at the school of Freiwaldau an education suitable to his station, and afterwards farmed his paternal estate. It appears that a neighbor, who had been in the way of healing trifling wounds on himself and others by means of cold water, treated P. successfully in this way for a serious injury from the kick of a horse; and P., having thus had his attention directed to the virtues of cold water, and being indisputably possessed of great sharpness of intellect and aptitude for the practice of the healing art, began to give advice to his neighbors how to cure all ailments with cold water, and soon attained considerable reputation among them. Although several times brought before the authorities for unlicensed practising, the simplicity of the means he used made it impossible to interfere with him. As the number of applicants for advice went on increasing, he gradually came, by experimental modifications of the way of applying his remedy, to form a kind of system of treatment for the various cases that presented themselves. At last, about 1826, strangers began to repair to Gräfenburg, and stay there for some time for treatment; in 1829, there were as many as 49 water-patients, and in 1837, the number had risen to 586. P. continued till 1833 to carry on his farming; but after that, his practice, and the care of the establishments which he had to provide for the reception and treatment of his patients, fully occupied him. He died November 28, 1851, leaving his establishment to his son-in-law. Very different judgments have been pronounced on the character of P. and his system of treatment, mostly according to the prejudices of the critics. He, himself, has left nothing in writing on his method of cure.—Wunde, *Die Gräff. Wasserheilanstalt und die P.'sche Curmethode* (6th ed. Leip. 1845).

PRIEST (Gr. *presbyteros*, Lat. *presbyter*, Fr. *prêtre*), the title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In the early history of mankind, the functions of the priest seem to have commonly been discharged by the head of each family; but on the expansion of the family into the state, the office of priest became a public one, which absorbed the duties as well as the privileges which before belonged to the heads of the separate families or communities. It thus came to pass that in many instances the priestly office was associated with that of the sovereign, whatever might be the particular form of sovereignty. But in many religious and political bodies, also, the orders were maintained in complete independence, and the priests formed a distinct, and generally speaking, a privileged class (see *Egyptian Priests*, *Indian Priests*, below). The priestly order, in most of the ancient religions, included a graduated hierarchy; and to the chief, whatever was his title, were assigned the most solemn of the religious offices intrusted to the body. In sacred history, the patriarchal period furnishes an example of the family priesthood; while in the instance of Melchizedek, king of Salem, we find the union of the royal with the priestly character. In the Mosaic law, the whole theory of the priesthood, as a sacrificial and mediatorial office, is fully developed. The priest of the Mosaic law stands in the position of a mediator between God and the people; and even if the sacrifices which he offered be regarded as but typical and prospective in their moral efficacy, the priest must be considered as administering them with full authority in all that regards their legal value.

The Mosaic priesthood was the inheritance of the family of Aaron, of the tribe of Levi. It consisted of a high priest (q. v.) and of inferior ministers, distributed into 24 classes. The age for admission to the priesthood is nowhere expressly fixed; but from 2d Chronicles xxxi. 17, it would seem that the minimum age was 20. In the service of the temple, the priests were divided into 24 classes, each of which was subject to a chief priest, and served, each company for a week, following each other in rotation. Their duties in the temple consisted in preparing, slaying, and offering victims; in preparing the shew-bread, burning the

incense, and tending the lights of the sanctuary. Outside, they were employed in instructing the people, attending to the daily offerings, enforcing the laws regarding legal uncleanness, &c. For their maintenance were set aside certain offerings (see FIRST-FRUIT) and other gifts. They wore a distinguishing dress, the chief characteristics of which were a white tunic, an embroidered cincture, and a turban-shaped head-dress. The Jewish priesthood may be said to have practically ceased with the destruction of the temple.

In the Christian dispensation, the name primitively given to the public ministers of religion was *presbyteros*, of which the English name 'priest' is but a form derived through the old French or Norman *prestre*. The name given in classical Greek to the sacrificing priests of the pagan religion, Gr. *hierous*, Lat. *sacerdos*, is not found in the New Testament explicitly applied to ministers of the Christian ministry; but very early in ecclesiastical use, it appears as an ordinary designation; and with all those bodies of Christians, Roman Catholics, Greeks, Syrians, and other orientals who regard the Eucharist as a sacrifice (see MASS), the two names were applied indiscriminately.

The priesthood of the Christian church is one of the grades of the Hierarchy (q. v.), second in order only to that of bishop, with which order the priesthood has many functions in common. The priest is regarded as the ordinary minister of the Eucharist, whether as a sacrament or as a sacrifice; of baptism, penance, and extreme unction; and although the contracting parties are held in the modern schools to be themselves the ministers of marriage, the priest is regarded by all schools of Roman divines as at least the normal and official witness of its celebration. The priest is also officially charged with the instruction of the people and the direction of their spiritual concerns, and by long-established use, special districts, called Parishes (q. v.), are assigned to priests, within which they are intrusted with the care and supervision of the spiritual wants of all the inhabitants. The holy order of priesthood can only be conferred by a bishop, and he is ordinarily assisted by two or more priests, who, in common with the bishop, impose hands on the candidate. The rest of the ceremonial of ordination consists in investing the candidate with the sacred instruments and ornaments of his order, anointing his hands, and reciting certain prayers significative of the gifts and the duties of the office. The distinguishing vestment of the priest is the *chasuble* (Lat. *planetæ*). In Roman Catholic countries, priests wear even in public a distinctive dress, which, however, in most respects is common to them with the other orders of the clergy. In the Latin Church, priests are bound to a life of celibacy. In the Greek and oriental churches, married men may be advanced to the priesthood; but no one is permitted to marry after ordination, nor is a married priest permitted to marry a second time, should his wife die.

In the Church of England, and other Reformed Episcopal Churches, the term priest is retained as the designation of the second order of clergy, whose special office it is (1) to celebrate the Sacrament of the Lord's Supper; (2) to pronounce the forms of Absolution in the Morning and Evening Prayer, in the Communion Service, and in the Office for the Visitation of the Sick; and (3) to preach, though this last office is, by special license, sometimes extended to deacons.

Priests only can hold a benefice with cure of souls. The age for admission into the priesthood is 24 years. (For the manner and ceremonies of admission, see ORDINATION.) Priests in the Church of England are ordinarily distinguished during divine service by a black stole of silk worn upon the surplice over both shoulders; deacons according to the ancient use, wearing it over one shoulder only. Marriage is permitted in the Church of England to all orders of the clergy.

Egyptian Priests.—In the political division of Egypt, the population is supposed to have been divided into three or four castes, at the head of which was the sacerdotal, or priests. This division, however, was not very strictly observed, as the son did not invariably follow the profession of the father. That of the priest appears most honorable, and two principal classes of priests were in existence at the earliest periods—the *hont*, or prophets, and the *ab*, or inferior priests. The first were attached to the worship of all the deities of Egypt; and in the greater cities, there was *hont apî*, high prophet, or priest, who presided over the others; at Thebes there were as many as four prophets of Ammon. Their duties appear to have comprised the general cultus of the deity. They also interpreted the oracles of the temples. Besides the prophets of the gods, others were attached to the worship of the king, and to various offices connected with the administration of the temples.

The class of priests called *ab*, or 'pure,' were inferior, and were also attached to the principal deities and to the personal worship of the monarch. They were presided over by a superintendent, but had no high priest. A third class of priests, the *karheb*, appear in connection with funeral and other ceremonies, and some other inferior persons of the hierarchy. The *scribes* formed a caste

apart, but those who were attached to the temple were of the priestly order. Besides these above mentioned, the Greeks enumerate a variety of sacred officials. The administration of the temples by the hierarchy was as follows: the temple was governed by a superintendent, or *epistates*, called in Egyptian *mer*, either the high priest or a prophet. Under him was a vicar, and a royal officer, called *epimeletes*, or overseer, by the Greeks. These attended to the receipts and expenses. Lay brethren, or *hierodules*, attended and assisted the priests in their functions; and in addition to these, there were a kind of monks in the Serapeum, who lived within the precincts of the temple, which they were not allowed on any account to quit. At Alexandria, under the Ptolemies, there was a priest of Alexander the Great, and others attached to the worship of the deceased Ptolemies, and also one attached to the worship of the living monarch. This priest, it appears, was nominated by the king himself, and drew a revenue from the different temples of Egypt. He was at this period the high priest of the whole country, and had no doubt superseded the former high priest of Ptah at Memphis, and of Amen-Ra at Thebes, who had formerly exercised a kind of pontificate. On solemn occasions a synod of the priests was held for purposes affecting the whole body.

Some light has been thrown on the relative dignities of the hierarchy by the hieroglyphical inscription on a statue of Bakenhonsou, a high priest of Amen-Ra, now at Munich. At the age of 16, he held a civil employment under Sethos I.; he was then made priest *ab* of Amen-Ra, which office he exercised for four years; after this, he rose to the rank of 'divine father' of the god, which office he held for 12 years; after that, he became third prophet of the same deity for 15 years; then second prophet for 12 years; and finally, at the age of 59, chief prophet or high priest of the god—held the post for 27 years, and died at the age of 86. The youthful age at which offices were held was probably owing to the careful education which the young priests had to undergo, and the habits required for the order. They were required to be scrupulously neat and clean, entirely shaven, clad in linen, and shod with papyrus sandals, and to maintain a rigid diet, in which was a careful abstaining from pork, mutton, beans, and salt, to which was added a bath twice a day, and other abstinences. They also fasted, and one of their fasts lasted 42 days; others even longer; they then lived on vegetable food alone, and exercised a rigid continence. They were, however, not unmarried, but allowed one wife. Their support was derived from various sources—as from royal and other endowments of the temples, from the gifts of votaries, and from charges on the produce of the country. On festivals, not only were they often clad in fine linen, but the addition of a panther-skin was often added to their attire; and they were anointed with perfumes and unguents. They offered water and burning incense.

Although Herodotus has stated that no woman was a priestess in Egypt, many functions connected with the temples were held by women. The most important was that of 'divine wife of Amen-Ra,' called by Diodorus the *gallakis*, or concubine, of Jupiter, which was conferred upon queens and princesses only. Another title was that of 'divine hand,' or adorer of the same god, a rank also held by royal personages. During the 4th dynasty, at the time of Cheops and the pyramids, there were prophetesses; but the order does not appear to have been kept up, for at a later period there only appear the *sua*, or singing women of the gods, and the *aha*, or performers, of the principal deities, who attended with *sistra* at the festivals. Besides these, other women had charge of certain things connected with the temple, and *canephoroi*, or basket-bearers. They had no distinctive dress, and were often the wives of prophets or other priests.—Boeckh, *Corp. Inscr. Græc.*, p. xxix., p. 303; Schmidt, *De Sacerdot. Ægyptior.*; Wilkinson, *Manners and Customs*, vol. i. p. 257; Devéria, *Monument de Bakenkhonsou* (Paris, 1862).

Indian Priests.—The priesthood of India belongs to the first caste, or that of the Brāhman's exclusively; for no member either of the Kshattriya or the Vaisya, or the Śūdra caste is allowed to perform the functions of a priest. But as the proper performance of such functions requires, even in a Brāhman's, the knowledge of the sacred texts to be recited at a sacrifice, and of the complicated ceremonial of which the sacrificial acts consist, none but a Brāhman's learned in one or more Vedas (q. v.), and versed in the works treating of the ritual (see KALPA-SŪTRA), possesses, according to the ancient law, the qualification of a priest; and so strict in ancient times, were the obligations imposed upon a priest, that any defective knowledge on his part, or any defective performance by him of the sacrificial rites, was supposed to entail upon him the most serious consequences both in this life and in the future.

As the duration of a Hindu sacrifice varies from one to a hundred days, the number of priests required at such a ceremony is likewise stated to be varying; again, as there are sacrificial acts at which verses from the R̥gveda only were recited, others requiring the inaudible muttering of verses from the Yajurveda only; others,

again, at which verses only of the Sāmaveda were chanted; and others, too, at which all these three Vedas were indispensable—there were priests who merely knew and practised the ritual of the R̥gveda, or the Yajurveda, or the Sāmaveda; while there were others who had a knowledge of all these Vedas and their rituals. The full contingent of priests required at the great sacrifices amounts to 16. Other inferior assistants at a sacrifice such as the ladle-holders, slayers, choristers, and the like, are not looked upon as priests. Such was the staff of priests required at the great and solemn sacrifices, which took place on special occasions, and could be instituted only by very wealthy people; from one to four priests, however, sufficed at the minor sacrifices, or those of daily occurrence. These were the rules and practices when the Hindu ceremonial obeyed the canon of the Vaidik ritual; and the latter probably still prevailed at the epic period of India, though many deviations from it are perceptible in the Mahābhārata and Rāmāyaṇa (q. v.). But at the Paurāṇik period and from that time downwards, when the study of the Vedas had fallen into disuse, and the Vaidik rites had made room for other ceremonies which required no knowledge on the part of a priest, except that of the reading of a prayer-book, and an acquaintance with the observances enjoined by the Purāṇas, but easy to go through, almost every Brahman, not utterly ignorant, became qualified to be a priest.—For the priesthood of the Buddhists, Jains, and Tibetans, see BUDDHISM, JAINAS, and LAMAISM.

PRIESTLEY, JOSEPH, son of Jonas Priestley, a cloth-draper at Fieldhead, near Leeds, was born at Fieldhead on 13th March 1733, O.S. His mother having died when he was six years old, he was adopted by an aunt, by whom he was sent to a free school. There he learned Latin and Greek. During vacation, he taught himself various languages, both ancient and modern. For some time he was obliged to abandon his studies, owing to weak health: he then betook himself to mercantile pursuits. With returning strength, his literary studies were resumed, and successfully prosecuted at a dissenting academy at Daventry under Mr. (afterwards Dr.) Ashworth, successor to Dr. Doddridge. Though his father and aunt were strong Calvinists, their house was the resort of many men who held very different opinions; and the theological discussions which he was in the habit of hearing, seem to have had much effect on young P.: before he was 19, he calls himself rather a believer in the doctrines of Arminius, but adds: 'I had by no means rejected the doctrine of the Trinity or that of the Atonement.' Before leaving home, he wished to join a Calvinistic communion, but he was refused admission, the ground of refusal being, that he had stated doubts as to the liability of the whole human race to 'the wrath of God and pains of for ever.' During his residence at the academy, he conceived himself called on to renounce nearly all the theological and metaphysical opinions of his youth. 'I came,' he says, 'to embrace what is called the heterodox side of every question.' In 1755, he became minister to a small congregation at Needham Market, in Suffolk, with an average salary of £30 per annum. While here, he composed his work entitled *The Scripture Doctrine of Remission, which shows that the Death of Christ is no proper Sacrifice nor Satisfaction for Sin*. His leading theological doctrine seems to have been, that the Bible is indeed a divine revelation, made from God to man through Christ, himself a man and no more, nor claiming to be more.

He seems to have rejected all theological dogmas which appeared to him to rest solely upon the interpretation put upon certain passages of the Bible by ecclesiastical authority. Even the fundamental doctrines of the Trinity and of the Atonement he did not consider as warranted by Scripture, when read by the light of his own heart and understanding. It does not, however, appear that these doctrinal errors produced any morally evil results. He not only contrived to live on £30 a year; but by adding a little to his income by means of teaching, he was enabled to purchase a variety of instruments to help him in his scientific studies. In 1758, he quitted Needham for Nantwich; and in 1761 he removed to Warrington, where he was appointed successor to Mr. (afterwards Dr.) Aikin, as teacher of languages and belles-lettres. At Warrington, he married Miss Wilkinson, a lady of great talent and amiability. Here his literary career may be said first fairly to have begun. A visit to London led to his making the acquaintance of Franklin and Dr. Price. The former supplied him with books which enabled him to write his *History and Present State of Electricity*, published in 1767. It was followed by a work on *Vision, Light, and Colors*. In 1762, he published his *Theory of Language and Universal Grammar*. In 1766, he was made a member of the Royal Society, and a Doctor of Laws by the university of Edinburgh. In the following year, he removed to Millhill, near Leeds, where he was appointed minister of a dissenting chapel. The fact of a brewery being beside his dwelling gave a new direction to his energetic and versatile mind; he began to study pneumatic chemistry, publishing various important works connected with this science.

'No one,' says Dr. Thomson, 'ever entered on the study of chemistry with more disadvantages than Dr. Priestley, and yet few have occupied a more dignified station in it.' While at Leeds, he agreed to accompany Captain Cook on his second voyage; but certain ecclesiastics having objected to the latitude of his theological views, the Board of Longitude refused to sanction the arrangement, and he did not go. In 1773, he was appointed librarian and literary companion to Lord Shelburn, with a salary of £250 per annum, and a separate residence. He accompanied the earl on a continental tour in the year 1774. Having been told by certain Parisian savans that he was the only man they had ever known, of any understanding, who believed in Christianity, he wrote, in reply, the *Letters to a Philosophical Unbeliever*, and various other works, containing criticisms on the doctrines of Hume and others. His public position was rather a hard one; for while laughed at in Paris as a believer, at home he was branded as an atheist. To escape the odium arising from the latter imputation, he published, in 1777, his *Disquisition Relating to Matter and Spirit*. In this work, while he partly materializes spirit, he at the same time partly spiritualizes matter. He holds, however, that our hopes of resurrection must rest solely on the truth of the Christian revelation, and that on science they have no foundation whatever. The doctrines of a Revelation and a Resurrection appear to him to have supported one another. He believed in a Revelation, because it declared a Resurrection; and he believed in a Resurrection, because he found it declared in the Revelation. On leaving Lord Shelburn, he became minister of a dissenting chapel at Birmingham.

The publication in 1786, of his *History of Early Opinions concerning Jesus Christ*, occasioned the renewal of a controversy, which had begun in 1778, between him and Dr. Horsley, concerning the doctrines of Free Will, Materialism, and Unitarianism. The victory in this controversy will probably be awarded by most men in accordance with their own preconceived views on the questions at issue. His reply to Burke's *Reflections on the French Revolution* led to his being made a citizen of the French Republic; and this led to a mob on one occasion breaking into his house, and destroying all its contents, books, manuscripts, scientific instruments, &c. He states that the sum awarded to him as damage fell £2000 short of the actual pecuniary loss. A brother-in-law, however, about this time left him £10,000, with an annuity of £200. In 1791 he succeeded to the charge at Hackney, which had become vacant by the resignation of Dr. Price. He did not remain long here, however. His honestly-avowed opinions had made him as unpopular as an honest avowal of opinions generally does. He removed to America, where he was received with respect, if not with enthusiasm. He had the offer of the professorship of Chemistry at Philadelphia, which he declined. In 1796, his wife died. To the day of his death, he continued to pursue his literary and scientific pursuits with as much ardor as he had shown at any period of his active life. He died 6th February 1804, expressing his satisfaction with his having led a life so useful, and his confidence in immortality. At Paris, his *éloge* was read by Cuvier before the National Institute. He has given us his autobiography down to 24th March 1795. He was a man of irreproachable moral and domestic character, remarkable for zeal for truth, patience, and serenity of temper. He appears to have been fearless in proclaiming his convictions, whether theological, political, or scientific. See *Memoirs of his own life*, continued by his son with observations by T. Cooper. Also life by John Corry.

PRILOU'KY, a district town of Little Russia, in the government of Poltava, and 150 miles north-west of the town of that name. Tobacco, corn, cattle, and tallow are the principal articles of trade, and are sold on the spot to dealers for export to Moscow, St. Petersburg, Riga, Poland, and abroad. The climate is good, and the soil fertile. Pop. (1880) 12,878, most of whom are engaged in the cultivation of tobacco.

PRILUKI, a town of European Russia, in the government of Poltava, 138 miles north-west from Poltava. It has a considerable trade in corn, cattle, brandy, and saltpetre. Pop. (1880) 12,878.

PRIMA DO'NNA (Ital.), the first female singer in an opera.

PRIMARY or PRIMITIVE LIMESTONE, the name formerly given to crystalline limestones, because it was supposed that they belonged to the oldest primary deposits. But as it is now known that many of these limestones are of much later origin, some even as late as the Tertiary Period, the name has fallen into disuse. See MARBLE.

PRIMATE (Lat. *primus*, Fr. *primat*, first) is the title of that grade in the hierarchy which is immediately below the rank of patriarch. The title strictly belongs to the Latin Church, but in its general use it corresponds with that of exarch (Gr. *exarchos*) in the Greek Church, although there were some exarchs who were not immediately subject (as were all primates) to a patriarch. This arose in the Eastern Church from the variation in the limits

of the patriarchates, which were not of simultaneous origin; but in the West, where the patriarch (i. e., the Roman bishop) was recognized as possessing universal jurisdiction, this exemption of any particular primate from superior jurisdiction could not of course arise.

The primate, as such, was the head of a particular church or country, and held rank, and, in some churches, a certain degree of jurisdiction, over all bishops and archbishops within the national church. This jurisdiction, however, was confined to the right of visitation and of receiving appeals. In Africa, the Bishop of Carthage, without the title, possessed all the rank and authority of a primate. The chief primatial sees of the West were: in Spain, Seville and Tarragona, afterwards united in Toledo; in France, Arles, Rheims, Lyon, and Rouen (among whom the Archbishop of Lyon, claims the title of *Primat des Primats*, 'Primate of the Primates'); in England, Canterbury; in Germany, Mainz, Salzburg, and Trier; in Ireland, Armagh, and for the Pale, Dublin; in Scotland, St. Andrews; in Hungary, Gran; in Poland, Gnesen; and in the northern kingdoms, Lund. In the Church of England the Archbishop of Canterbury is styled Primate of all England; the Archbishop of York, Primate of England.

In Ireland, the Archbishop of Armagh is Primate of all Ireland, and the Archbishop of Dublin Primate of Ireland. The title of Primate in England and Ireland confers no jurisdiction beyond that of archbishop. The name *primus* is applied in the Scottish Episcopal Church to the presiding bishop. He is chosen by the bishops out of their own number, without their being bound to give effect to seniority of consecration or precedence of diocese.

PRIMATE'S, the name given by Linnæus to the first order of Mammalia in his system, and which he placed first (whence the name, Lat. *primus*, first), because he ranked man amongst them, and account them highest in the scale of nature. He assigned as the characters of the order, incisor teeth in the front of the mouth, four in the upper jaw, in one row; mammae two, pectoral. In this order he placed four genera, *Homo* (in which he included man and the orang-outang), *Simia*, *Lemur*, and *Vespertilio*; corresponding to the *Bimam* (Man alone), *Quadrumana*, and *Cheiroptera* of Cuvier. That many of the P. of Linnæus really occupy a higher place in the scale of nature, either as to organization or intelligence, than many other Mammalia, is more than doubtful.

PRIME (Lat. *prima*, the first—i. e., hour), the first of the so-called 'lesser hours' of the Roman BREVIARY (q. v.). It may be called the public morning-prayer of that church, and corresponds in substance with the morning service of the other ancient liturgies, allowance being made for Latin peculiarities. Prime commences with the beautiful hymn of Prudentius, *Jam lucis orto sidere*, which is followed by three, and occasionally four psalms, the last portion of which consists of the opening verses of the 118th (in the authorized version, 119th) psalm, which is continued throughout the rest of the 'lesser hours.' Prime concludes with prayers appropriate to the beginning of a Christian's day.

PRIMOGENITURE is the rule of law under which the eldest son of the family succeeds to the father's real estate in preference to, and in absolute exclusion of, the younger sons and all the sisters. This is the rule adopted in Britain and in most European countries, though latterly the policy of the rule has been disputed, and the contrary example of France pointed to as an example or a warning, according to the theory advocated. The rule operates as follows: whenever a man dies intestate, leaving real estate—i. e., lands and houses—his eldest son is the only person entitled by law to the whole; and if the other brothers and the sisters are not otherwise provided for out of the personality they are left destitute. If the eldest son is dead, but has left an eldest son, such grandson of the deceased, in like manner, succeeds to the whole lands exclusively, and so on, following in succession, the eldest sons of eldest sons, and their next eldest sons, one by one, in their order of seniority. But when the male line is exhausted, then females do not succeed in the same way singly and by seniority, but all together succeed jointly. Such is the rule in England and in Scotland. The preference of males to females was also the Jewish rule and the Greek rule, or at least that which prevailed at Athens; but it was unknown to the Romans. It is generally said our preference of males took its origin from the feudal system, by which the devolution of land depended on the personal ability of the party to perform military service. Our Danish ancestors seem not to have acknowledged any preference of the males, but the Saxons did so.

Our law does not, like the Salic law, totally exclude females, but merely postpones them until the males are exhausted. Though, however, it is the general law of England, as well as Scotland and Ireland, there is one county in England, that of Kent, where, by ancient custom—called gavelkind—a different rule prevails, and the land, instead of going wholly to the eldest son, is divided equally among all the sons. So there is an exception, called Borough English, in some boroughs and cities of England, where the land, instead of going to the eldest son, goes wholly to the

youngest son. The evils said to be attendant on the law of primogeniture are alleged to be, that it often produces great hardship, by making one of the family enormously rich, and the others very poor, thereby introducing a sense of inequality and injustice among those who are apt to believe themselves equals by the law of nature. It also tends to encourage the accumulation of landed property in a few hands, and thereby cuts off the great mass of the people from the gratification of a natural desire, and from one incentive to industry—viz., the acquisition of a portion of the soil. On the other hand, it is said that the cases of hardship in reality seldom occur, for, especially in modern times, an equal amount of personal property is often held by the same owners, and the rule does not apply to personality, which is equally divided among all the children. Moreover, the great landowners seldom die intestate, but almost invariably provide for their younger children by means of charges or burdens on the family estate, and so counteract the effect of the law of primogeniture.

The accumulation of landed property is said to be not an evil, but the contrary, for it enables agriculture to flourish, inasmuch as the larger the farms, the greater is the capital required, and the greater benefit to the land, and ultimately to the public. The law of primogeniture in England is not as it is or was in Scotland, stereotyped in its most odious form by the practice of entailing the lands, and so locking them up for generations in one family, excluding them from commerce, and of necessity preventing the successive heirs in possession from making improvements. The evils of the Scotch entail system have long been exposed, and led, in 1848, to a relaxation of the law, by which the practice of disentailing the property is made more easy and frequent. But in England, land cannot be locked up for a greater period than the lives of persons in existence, and for 21 years more, after which the parties entitled can sell or bring the lands into the market at their discretion; so that it is not correct to say that the accumulation of land in the great families is caused by the law of primogeniture, for practically each successive generation can do what it likes with the property, and squander it at will. It is only by the operation of the natural feelings of family pride that the family estates are kept together in a family.

The mode in which this is practically done in England is as follows: the peer or head of the family being tenant for life, and the inheritance being entailed upon his eldest son, who is about to marry, the father and son take the proper legal steps (which they can always do jointly) for unsettling the estate, and obtaining the absolute dominion over it. They then proceed to resettle the estate, making the father as before tenant for life, then the son is reduced in his turn to a tenant for life also, after the father, instead of, as before, being tenant in tail, or full proprietor. Thus, the maintenance of the family dignity is secured for another generation by settling the inheritance on the eldest male issue of the intended marriage; and when the grandson attains the age of 21, or is about to marry, he and his father act in the same way towards the next generation. The English law of landed property has been said to answer admirably all the purposes to which it is applicable, for a testamentary power is given which stimulates industry, and encourages accumulation; and while capricious limitations, such as perpetual entails, are restrained, property is allowed to be moulded according to the circumstances and wants of every family.

PRIMROSE (*Primula*), a genus of plants of the natural order *Primulaceæ*, having a bell-shaped or tubular 5-toothed calyx, a

Common Primrose (*Primula vulgaris*).

salver-shaped corolla with five segments, five stamens, a globose germen containing many ovules, and a many-seeded capsule opening by five valves, and generally with ten teeth at the apex. The species are all herbaceous perennials, generally having only radical leaves; and the flowers in a simple umbel, more rarely with scapes bearing solitary flowers. Almost all of them are natives of Europe and the north of Asia. Some of them are among the finest ornaments of our groves and meadows; some are found in

mountainous regions. Their fine colors and soft delicate beauty have led to the cultivation of some of them as garden flowers, probably from the very beginning of floriculture. The name *P.* (Fr. *Primevère*, Lat. *Primula*) is derived from the Latin *primus*, first, and refers to the early appearance of the flowers of some of the most common species in spring.—The COMMON *P.* (*P. vulgaris*), abundant in woods, hedgebanks, and pastures in Britain and in most parts of Europe, has obovate-oblong, wrinkled leaves, and single-flowered scapes; the flowers about an inch broad, yellowish white. This is the plant to which the English name *P.* specially belongs. Akin to it is the COWSLIP (q. v.), or PATLE (*P. veris*), and perhaps still more nearly related is the OXLEY (*P. elatior*), apparently wild in some parts of England, particularly in the eastern counties, but supposed by some botanists to be intermediate between the Common *P.* and the Cowslip, which they therefore regard as extreme forms of one species.

The POLYANTHUS (q. v.) is a cultivated variety of the Cowslip.—The AURICULA (q. v.) (*P. auricula*), an Alpine species, is a favorite garden flower.—The BIRD'S EYE *P.* (*P. farinosa*) and the SCOTISH *P.* (*P. scotica*) are both flowers of exquisite beauty, found in the northern parts of Britain; the latter chiefly on the coasts of Sutherland, Caithness, and the Orkney Islands. The Alps and the Himalaya Mountains produce several species.—The CHINESE *P.* (*P. sinensis*) has for more than forty years been very common in Britain, not only as a greenhouse but a window plant. It produces compound umbels of very numerous lilac or white flowers, which are displayed in autumn, winter, and spring.

PRIMULACEÆ, a natural order of exogenous plants, containing more than 200 known species, mostly natives of temperate and cold regions. They are all herbaceous, or scarcely half-shrubby, with leaves generally all radical, and no stipules. The calyx is generally 5-cleft, inferior or half-superior, regular, persistent; the corolla, with the limb divided into as many segments as the calyx, rarely wanting; the stamens inserted on the corolla, one opposite to each of its lobes; the ovary one-celled, the style solitary, the stigma capitate; the capsule with a central placenta and many seeds.—Many of the *P.* have flowers of much beauty, and some are very fragrant, as the Primrose, Cowslip, Auricula, Pimpernel, Loosestrife, &c.

PRIMUM MOBILE. See PTOLEMAIC SYSTEM.

PRINCE (Lat. *princeps*, from *primus*, first, and *capio*, I take), an epithet which was originally applied to the *princeps senatus* of the Roman state, and afterwards became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterwards applied to persons enjoying high power, more especially the rulers of small states, either sovereign, as in the case of the ancient Princes of Wales, or dependent, like the rulers of certain states in Germany. The title is now very generally applied to the sons of kings and emperors, and persons of the blood-royal. In various parts of continental Europe, the title Prince is borne by families of eminent rank, but not possessed of sovereignty; and in England, a duke is, in strict heraldic language, entitled to be styled 'High Puissant and most Noble Prince;' and a Marquess or Earl as 'Most Noble and Puissant Prince.' Practically, however, in Britain, the term prince is restricted to members of the royal family. The eldest son of the reigning sovereign is by a special patent created Prince of Wales, and this is the only case in which the title prince is connected with a territorial distinction. In Germany, the ambiguity of applying the same title to members of royal houses and princely families, not sovereign, is avoided, the former being styled 'Prinz,' the latter 'Fürst.' The German Fürst takes rank below the Duke (Herzog). Most of the counts who had a seat in the old German Diet were elevated to the dignity of prince on their acquiescence in the dismemberment of the German empire. In a more general acceptation, the term prince is often used for a sovereign or the ruler of a state.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, in the south of the Gulf of St. Lawrence, and separated from New Brunswick and Nova Scotia by the Strait of Northumberland, lat. about 45° 56'—47° 4' N., long. 62°—64° 23' W. Length, 130 miles; breadth, 4 to 34 miles; area, 2173 square miles. Pop. (1841) 47,034; (1871) 94,021; (1881) 108,928. The surface is undulating; but few of the hills, the chief of which are in the middle of the island, and run from north to south, are upwards of 300 feet in height. The coasts are girdled by a bold line of red sandstone cliffs, varying in height from 20 to 100 feet, and are indented with numerous bays and inlets, several of which, as Cardigan Bay on the east, the entrance to Georgetown, and Hillsborough Bay on the south, the entrance to Charlottetown (the capital of the colony), are deep and spacious, and afford safe anchorage for large vessels. Other inlets are Bedeque and Egmont Bays on the south, and Holland, Richmond, and St. Peter's Bays on the north. The rivers are mostly short. The soil, which is well watered with numerous springs and rivers, rests upon red sandstone, and consists for the most part of

a layer of vegetable matter above a light loam, which rests upon stiff clay above sandstone. It is of great fertility, and the agricultural products are about double the quantity required for local consumption. Of the whole area, consisting of 1,360,000 acres, 1,300,000 are 'good' land, and 60,000 acres are 'poor' land; and in 1851, there were under cultivation 215,389 acres; in 1871, 1,097,860 acres.

Since the year 1848, agriculture has become a much more important branch of industry. Between 1848 and 1861 the agricultural products had increased in many instances fourfold. In 1871, the amount of wheat produced was 269,392 bushels; of barley, 176,441 bushels; oats, 3,128,576 bushels; beans and peas, 1326 bushels; maize, 2411 bushels; and potatoes, 3,375,726 bushels. In April 1871, the live-stock in the colony comprised 25,329 horses, 62,984 large cattle, 147,864 sheep and lambs, and 52,514 pigs. The soil and climate are admirably adapted for producing wheat, and all the cereals, fruits, and vegetables grown in temperate climes are produced here. The climate, milder than that of the continental regions in the vicinity, and free from the fogs which prevail on Cape Breton and Nova Scotia, is very healthy. *P. E. I.* is extremely poor in minerals; copper and bog-iron ore are known to exist in small quantities. In the neighboring waters, extensive and profitable fisheries are carried on. The fish caught are principally mackerel, salmon, alewives or gaspereaux (of the herring family), herrings, cod-fish, and lake. Manufactures are not important, though cloth is made to some small extent. The Prince Edward Island Railway, 198 miles in length, was opened in 1875. It is constructed on a 3 feet 6 inch gauge, and cost about £3300 per mile. In the three years 1879—1881, the value of exports varied from \$1,830,000 to \$1,730,000, and the imports from \$835,000 to \$965,000. The provincial government is vested in a lieutenant-governor, a House of Assembly, a legislative council, and an executive council appointed by the lieutenant-governor. The legislature of *P. E. I.* declined to agree to the plan for a union of the British North American colonies which resulted from the negotiations begun in 1864; but at last, in 1873, this colony entered the Confederation, and became one of the provinces of the Dominion.

Charlotte-town, the provincial capital, had in 1871 a pop. of 8807, and in 1881, of 11,435. *P. E. I.* possesses about 350 vessels of nearly 60,000 tons. There are in the province a college, a normal school, a model school, 13 grammar-schools, and about 400 district schools. Tuition is free in all but the college, with the exception of a small fee for fuel. In 11 months ended January 1, 1874, £11,838 was disbursed from the colonial treasury for public education. The island is divided into 3 counties—Prince, Queen's and King's counties—of which the chief towns are respectively Summerside, Charlottetown, and Georgetown. All parts of the island are traversed by coach-roads; and the island has a telegraph-system, partly submarine. The railway crosses the island, connecting Charlottetown with Tignish on the N.W., and Georgetown and Souris on the S.E. The island was first taken possession of by the British in 1745, and was retaken by them, and finally annexed to their possessions in 1758.

PRINCE OF WALES, the title borne by the eldest son of the sovereign of England. The native sovereigns of Wales were so designated in the days of Welsh independence; and on the conquest of Wales, the principality of Wales and earldom of Chester were bestowed by Henry III. on his son, afterwards Edward I., but as an office of trust and government, rather than as a title. It is traditionally related that Edward I. engaged to give the Welsh people a prince who would be born among them, and not know a word of English, and fulfilled the promise by bestowing the principality on his infant son, Edward, born at Caernarvon Castle. Edward, by the death of his elder brother, became heir-apparent. Edward III., his son, was never Prince of Wales; but in 1343, he invested his son Edward the Black Prince with the principality, and from that time the title of prince of Wales has been borne by the eldest son of the reigning king. The title is, however, not inherited, and has usually been bestowed by patent and investiture, though, in a few instances, the heir to the throne has become Prince of Wales simply by being so declared.

The eldest son of the sovereign is by inheritance Duke of Cornwall, a title first conferred in 1337 on Edward the Black Prince, on the death of his uncle, John of Eltham, the last Earl of Cornwall, and held, according to the terms of the grant, by the first-born son of the king. The title of Earl of Chester, borne by Edward III. before his accession to the throne, has since been given along with the principality of Wales. That earldom was, by 21 Richard II. c. 9; erected into a principality; and it was enacted that it should be given in future to the king's eldest son—a precedent which has since been followed, although that statute, along with all others in the same parliament, was repealed by 1 Henry IV. c. 3. On the death of a Prince of Wales in his father's lifetime, the title has been conferred on the sovereign's grandson, or next younger son, being

heir-apparent. As heir of the crown of Scotland, the eldest son of the sovereign is Prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles. The high office held by the House of Stewart (see STEWART, HOUSE OF) became merged in the crown when Robert II. the representative of the family, ascended the throne of Scotland in 1371. The earldom of Carrick was conferred by Robert II. on his eldest son. The dukedom of Rothesay was created by a solemn council held at Scone in 1398, and conferred on David, eldest son and heir of Robert III.; and when David, in 1402, fell a victim to the ambition of his uncle, it was transferred to his brother James, afterwards James I. of Scotland. Renfrew was the chief patrimony of the Stewards of Scotland, to whom it was granted by the sovereign in the 12th century, their principal residence having been in the burgh of Renfrew.

In 1404, King Robert III. granted the barony of Renfrew and other portions of the estates of the Stewards to his son and heir, James, since which time the eldest son of the sovereign has borne the title of Baron of Renfrew. By act of the Scottish parliament of 1469, the titles of prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles were vested in the eldest son and heir-apparent of the crown of Scotland for ever. The present Prince of Wales was created Earl of Dublin on September 10, 1849, that dignity being destined to him and his heirs, kings of the United Kingdom of Great Britain and Ireland, for ever.

An annuity of £40,000 was settled on the Prince of Wales by 26 Vict. c. 1. He has besides the revenues of the duchy of Cornwall. These amounted previously to 1840 to between £11,000 and £16,000; since that period, they have greatly risen, amounting in 1876 to £99,827. Only a small part of this income has been expended since the birth of the present Prince of Wales. The sum paid over to the Prince of Wales in 1868 was £55,252; and in 1876, £70,375. An income of £10,000 has been settled by parliament on the Princess of Wales, to be raised to £30,000 in the event of her widowhood. The annuities of the Prince and Princess of Wales are charged on the Consolidated Fund.

The Prince of Wales has a separate household, as also has the Princess of Wales. Act 35 Geo. III. c. 125 makes provision to prevent the accumulation of debt by any future heir-apparent to the crown, and enacts that as soon as he shall have a separate establishment, the treasurer or principal officer shall make a plan of such establishment in distinct departments and classes, with the salaries and payments of each class, and of each individual officer; and the treasurer is made responsible for the punctuality of all payments, and required to submit his accounts to the Lords of the Treasury. The statute of treasons, 25 Edw. III., makes it treason to compass the death of the Prince of Wales, or violate the chastity of his consort.

By a statute of the order of the Garter, of date 1805, the Prince of Wales becomes a Knight of the Garter as soon as he receives that title.

In 1788, on the illness of George III., it was made a question whether the Prince of Wales was not, as heir-apparent entitled to the regency; the recovery of the king prevented the necessity for a decision, but it is now held that he has no such right.

The arms of the Prince of Wales are those of the sovereign, differentiated by a label of three points argent, and the present Prince of Wales bears *en surtout* the escutcheon of the house of Saxony. The supporters and crest are the same as those of royalty. The ancient coronet of the Princes of Wales was a circle of gold set round with four crosses patée, and as many fleurs-de-lis alternately. Since the Restoration, it has been closed with one arch only, adorned with pearls, surmounted by a mound and cross, and furnished with a cap trimmed with ermine, like that of the sovereign. The Prince of Wales has further a distinguishing badge, composed of a plume of three white ostrich feathers, encircled by an ancient coronet of a Prince of Wales, and accompanied by the motto 'Ich dien' (I serve). This device is said by a tradition, on which considerable doubts have been thrown, to have been first assumed by the Black Prince after the battle of Crécy, in 1346, when he took such a plume from John, king of Bohemia, whom he had slain with his own hand. The motto has been supposed to allude to the fact that the king of Bohemia served, or was stipendiary to the French king in his wars.

PRINCE OF WALES ISLAND, or PU'LO PINA'NG (Betel Nut Island), an important British possession, and one of the Straits Settlements (q. v.), lies at the mouth of the Strait of Malacca, near the W. coast of the Malay Peninsula, in lat. 5° 16'—5° 30' N., and long. 100° 9'—100° 25' E. Length, 13½ m.; breadth, 5 to 10 m.; area, 106 sq. m. A belt of cocoa-nut and lofty areca palms runs along the coast. A slip of low land, interspersed with hills, stretches along the east side of the island, where rice, pepper, betel, fruits, provisions, &c., are planted on the level parts; nutmeg and clove-trees on the heights. This district is

watered by numerous streams, cut by well-kept roads, and dotted with villas and gardens. Sugar, coffee, and pepper plantations are on the south and south-west coasts; thence rises a wooded mountain ridge, which increases in elevation towards the north, where, at the Sanitarium bungalows of Strawberry Hill, it attains a height of 2923 feet. The rocks are granite and mica schist; the soil, a rich vegetable mould.

The climate of P. of W. I. is healthy, a sea-breeze blowing every day, and rain falling during all the months of the year, except January and February. In the low lands, the thermometer ranges from 80° to 90°, and at Strawberry Hill, from 62° to 75°, affording a pleasant change within a few miles of Georgetown. From the Sanitarium a splendid view is obtained of the plantations, town, shipping, and the lofty hills of Queda.

The products are timber, pepper, sugar, nutmegs, cloves, coffee, coco and areca nuts, ginger, sweet potatoes, rice, &c.; and the pine-apple, shaddock, plantain, banana, orange, lemon, mango, guava, &c., abound. The attempt to grow cotton has proved a failure. Tin ore is found at the base of the mountains. The imports may be valued at about £1,600,000; the exports at £2,000,000. European and American manufactures, and a share of the produce of the Eastern Archipelago, China, India, Siam, and Burmah, enter the emporium of P. of W. I. on their way to suitable markets.

Georgetown, the capital, is situated at the north-east extremity of the island, and is defended by Fort Cornwallis. The governor's house and the hospital are at some distance from the town, which is the seat of government for the Eastern Straits settlements, including Malacca and Singapore. On the peninsula opposite lies the province of Wellesley, a strip of country 35 miles in length by 4 to 11 miles in breadth. The population of P. of W. I., in 1871, was 61,797, and along with that of the province of Wellesley, 133,230; of whom the greater number are Malays, many are Chinese, four or five hundred are Europeans and their descendants, the remainder being Siamese, Burmans, Bengalese, &c.

Towards the end of last century, a Captain F. Light married the daughter of the king of Queda, from whom he received the gift of P. of W. I.; but in 1786, it was handed over to the East India Company, who retained Captain Light as superintendent, and paid the king 6000 dollars annually. By an arrangement to pay an additional 4000 dollars yearly, the province of Wellesley was afterwards ceded to the Company. Population rapidly increased, the forests were cleared for plantations, and a large trade sprung up. It has been nearly stationary for several years, except in agriculture, owing to the more favorable situation of Singapore for the general commerce of these seas.

PRINCE RUPERT'S DROPS. These scientific toys, so called from Prince Rupert (see RUPERT), their inventor, are simply drops of glass thrown, when melted, into water, and thus suddenly consolidated. They have usually a form somewhat resembling a tadpole. The thick end may be subjected to smart hammering on an anvil without its breaking; but if the smallest fragment of the tail be nipped off, the whole flies into fine dust with almost explosive violence. The phenomenon is due to the state of strain in the interior of the mass of glass, caused by the sudden consolidation of the crust. The crust is formed while the internal mass is still liquid. This tends to contract on cooling, but is prevented by the molecular forces which attach it to the crust. It is therefore somewhat in the state of the dog-head of a gun on full-cock, which will stand a smart blow without falling; while a slight touch applied to the trigger allows the spring to act. Another example of the same state of constraint is the Bologna phial—a glass cup with its sides thin but the bottom very thick. It also is cooled as quickly as possible. A bullet may be dropped into it with safety from a considerable height; but if a small, sharp-edged fragment of flint be dropped in, so as to scratch the surface in the slightest degree, the molecular forces are set free, and the whole falls to pieces.

PRINCE'S METAL. See TRIN.

PRINCETON, a town and township of New Jersey, on a branch of the Pennsylvania Railway, 40 miles N.E. of Philadelphia. It is pleasantly situated, and contains many elegant residences; has a bank, a weekly newspaper, and several churches. The pop. of P. in 1870 was 3986. On January 3, 1777, it was the scene of a battle between the British under Colonel Mawhood, and the Americans under Washington, in which the former were defeated. P., however, is chiefly celebrated as the seat of the College of New Jersey, popularly known as Princeton College, founded by charter in 1746, under the auspices of the Presbyterian Synod of New York, and transferred from Newark to P. in 1757, on the erection of a hall named Nassau Hall in honor of William III. The College of New Jersey has had several distinguished Presbyterian divines for its presidents, as Jonathan Edwards, Aaron Burr, and Dr. McCosh. In 1874-75 it had 14 professors, 6 instructors, and 403 students. The theological seminary, founded

in 1812, has 6 professors, 1 tutor, and 116 students. With the P. theological school is associated the fame of the *Biblical Repository* and *Princeton Review*, founded in 1825, and for many years edited by Dr. Hodge, Professor in the theological seminary. The *P. Review* is now, however, edited in New York.

PRINCIPAL AND ACCESSORY. See **ACCESSARY.**

PRINCIPAL AND AGENT. The law of principal and agent is founded on the absolute necessity of having some one to act for another in times and places when the latter is not personally present, and this necessity pervades nearly all branches of the law; and as a general rule, the act of the agent is just as binding on the principal, and produces the same effect, as regards his liability, as if the principal had acted in person. Agents are divided into many classes; indeed, nobody can escape, in one capacity or another, being occasionally the agent of somebody else. Attorneys, solicitors, advocates, brokers, auctioneers, &c., may be said to make a business of agency. A wife is, in law, for many purposes of household management, the agent of the husband, and so are the children. Mercantile agents are generally called factors or brokers. The contract between principal and agent implies that the agent shall keep within the limits of his commission, and that the principal will ratify and accept all his contracts, and relieve him of the liabilities. The remuneration of the agent is generally called his commission. As the agent binds his principal, it follows that the principal can be sued by third parties who deal with the agent. The nice distinctions that exist in the law on this subject as to the mutual rights and liabilities of the parties are too numerous to be here noticed.

PRINCIPAL AND SURETY. See **SURETY.**

PRINCIPATO, CITRA and ULTRA, formerly the name of two provinces of the kingdom of Naples. *Principato Citra*, now forming the province of Salerno in the reorganized kingdom of Italy, is a maritime province, bounded on the S.W. by the Mediterranean, and on the N. by the province of *Principato Ultra*, now called *Avellino*. The united area of the two provinces is 3405 square miles; pop. (1881) 942,849. Principal towns in *Principato Citra* are Salerno (from which it derives its present name), Sarno, and Pagani; in *Principato Ultra*, *Avellino* (from which it takes its present name), Ariano, and Cervinara.

PRINTERS, LAW AS TO. There were various restrictions on the sale and use of printing-presses, which had been imposed in consequence of the extended and secret influence often exercised by them; and the law of treason and libel is intimately associated with the press. By an act of 32 and 33 Vict. c. 24, which altered several older acts passed in the reign of George III. for suppressing seditious and treasonable practices, reciting the mischief produced by the publication of irreligious, treasonable, and seditious libels, and the difficulty of tracing them, it is not now law that every person having a printing-press, or types for printing, shall give notice thereof to the clerk of the peace where the same is intended to be used, and shall obtain a certificate of registration, otherwise he is liable to a penalty of £20. And the Queen's printers for England and Scotland, and the university presses of Oxford and Cambridge, were exempt. No letter-founders and makers of types need register themselves under a like penalty, and need not keep an account of all the persons to whom types and presses are sold, which account may be inspected by a justice of the peace. But printers must keep a copy of every paper they print for hire or reward, and shall endorse thereon the name of the person employing them to do so, under a penalty of £20. Every printer who shall print a book or paper without having the printer's name and address on the first or last leaf thereof, shall, by the act 32 and 33 Vict. c. 24, forfeit £5 for every copy printed; but the only person who can sue for or enforce this penalty is the Attorney or Solicitor General of England, or the Lord Advocate of Scotland. And any proceedings to enforce the statutes in the name of other persons are absolutely void.

The law is thus changed that a printer cannot recover his expenses for labor and materials in printing a work, unless he has complied with the statutory requirements. On a recent occasion, in which a printer in England who sued for his account was met with a defence founded on these statutes, it was discovered by the London printers that few of them had registered themselves; and such law is now repealed altogether. With regard to the printing trade, many customs prevail which do not differ in point of law from the customs affecting other trades, it being the rule that customs of a peculiar trade are binding unless specially excluded. As to obscene prints, see **OBSCENE.**

PRINTING is the art of producing impressions, from characters or figures, on paper or any other substance. There are several distinct branches of this important art—as the printing of books with movable types, the printing of engraved copper and steel plates (see **ENGRAVING**) and the taking of impressions from stone, called *Lithography* (q. v.) We have now to describe the art of printing books or sheets with movable types, generally

called *letter-press printing*, and which may undoubtedly be esteemed the greatest of all human inventions.

The art of printing is of comparatively modern origin, only 400 years having elapsed since the first book was issued from the press; yet we have proofs that the principles upon which it was ultimately developed existed among the ancient Assyrian nations. Entire and undecayed bricks of the famed city and tower of Babylon have been found stamped with various symbolical figures and hieroglyphic characters. In this, however as in every similar relic of antiquity, the object which stamped the figures was in one block or piece, and therefore could be employed only for one distinct subject. This, though a kind of printing, was totally useless for the propagation of literature, on account both of its expensiveness and tediousness.

The Chinese are the only existing people who still pursue this rude mode of printing by stamping paper with blocks of wood. The work which they intend to be printed is, in the first place, carefully written upon sheets of thin transparent paper; each of these sheets is glued, with the face downwards, upon a thin tablet of hard wood; and the engraver then, with proper instruments, cuts away the wood in all those parts on which nothing is traced; thus leaving the transcribed characters in *relief*, and ready for printing. In this way, as many tablets are necessary as there are written pages. No press is used; but when the ink is laid on, and the paper carefully placed above it, a brush is passed over with the proper degree of pressure. A similar kind of printing by blocks, for the production of playing cards and rude pictures of scriptural subjects, was in use in Europe towards the end of the 14th century. But in all this there was little merit. The great discovery was that of forming every letter or character of the alphabet separately, so as to be capable of re-arrangement, and forming in succession the pages of a work, thereby avoiding the interminable labor of cutting new blocks of types for every page. The credit of discovering this simple yet marvelous art is contested by the Dutch in favor of Laurence Coster (q. v.), between 1420 and 1426; and by the Germans, on behalf of Johann Gansfleisch of the Gutenberg (q. v.) family, about 1438. In all probability, the discovery was made almost simultaneously—such a theory being consistent with the general social progress at the period, and the secrecy which both inventors at first maintained respecting their art.

The types first employed were of wood; but soon the practice of casting them in metal was introduced. See **TYPES.** The earliest of these metal types resembled the black letter in use by transcribers, and one great aim of the first printers was to produce books which should closely resemble the works in manuscript hitherto in use. Between 1450 and 1455, Gutenberg succeeded in printing a Bible, copies of which are now exceedingly rare and valuable. It is in quarto size, double columns, the initial letters of the chapters being executed with the pen, in colors. Besides this Bible, some other specimens of the work of Gutenberg, the produce of his press at Mayence, have been discovered. The Dutch, at Haarlem, preserve and show with reverential care similar specimens of early printing by Coster. Mayence, Strasburg, and Haarlem were indisputably the places where printing was executed before the art was extended to Rome, Venice, Florence, Milan, Paris, Tours, and other continental cities. Previous to 1471, it had reached these and various other places; and about the same year, Caxton (q. v.) introduced the art into England, by setting up a press in Westminster Abbey.

Printing was introduced into Scotland about 30 years after Caxton had brought it to England; in 1551, it reached Dublin, and to other quarters it found its way very slowly. While coming into notice, its progress had been interrupted by the broils consequent on the Reformation; and soon afterwards, it was retarded by the civil war in Great Britain. Even the Restoration acted detrimentally, for it led to an act of parliament which prevented more than 20 printers carrying on their art in England. Printing, in short, has in almost every country been an ill-used art; and is still in various countries practised under fiscal restrictions. Germany, the mother of the art, had quite recently, on account of sundry obstructions, the repute of printing badly so far as appearance was concerned, but has of late made great progress in this particular. Holland, France, and the United States produce excellent fine art and general printing, and great proficiency has been attained in England also. Printing is done, with greater or less tastefulness, in all the British colonies. Even among uncivilized people missionaries have established the printing-press.

Retarded by the jealousy of governments, printing for some ages derived little advantage from mechanical ingenuity. Originating at the middle of the 15th, the art continued to be conducted until the middle of the 17th c. in a very clumsy manner. The press resembled a screw-press, with a contrivance for running the form of types under the point of pressure; force having been thus applied, the screw was relaxed, and the form withdrawn with the impression executed on the paper. The defects of this very rude

mechanism were at length partially remedied by an ingenious Dutch mechanic, Willem Jansen Blaeu, who carried on the business of a mathematical instrument-maker at Amsterdam. He contrived a press, in which the carriage holding the form was wound below the point of pressure, which was given by moving a handle

Fig. 1.—Old Common Press.

attached to a screw hanging in a beam having a spring, which spring caused the screw to fly back as soon as the impression was given. This species of press, which was almost entirely formed of wood, continued in general use in every country in Europe till the beginning of the present century. With certain lever powers attached to the screw and handle, it is represented above.

In connection with this representation of the old common press, the process of printing may be described. The form, being laid on the sole of the press (*s*), is fixed at the sides, so as to render it immovable from its position. There are two men employed: one puts ink on the form, either by means of stuffed bails or by a composition-roller, and the other works the press. The latter lifts a blank sheet from a table at his side, and places it on what is called the *tympan* (*t*), which is composed of parchment and blanket-stuff, fitted in a frame, and tightened like the top of a drum—and hence its name—and which, by means of hinges connecting it with the sole, folds down like a lid over the form. As the sheet, however, would fall off in the act of being brought down, a skeleton-like slender frame, called a *frisket* (*f*), is hinged to the upper extremity of the tympan, over which it is brought to hold on the paper. Thus, the frisket being first folded down over the tympan, and the tympan next folded down over the form, the impression is ready to be taken. This is done by the left hand of the pressman winding the carriage below the *platten* (*p*), or pressing surface, and the impression is performed by the right hand pulling the handle attached to the screw mechanism. The carriage is then wound back, the printed sheet lifted off, and another put on the tympan, the form again inked, and so on successively. In the above engraving, the press appears with the frisket and tympan sloping upwards, ready to receive the sheet, the frisket being sustained from falling backwards by a slip of wood depending from the ceiling.

One of the greatest niceties connected with this art is the printing of the sheet on the second side in such a manner, that each page, nay, each line, shall fall exactly on the corresponding page and line on the side first printed. To produce this desirable effect, two iron points are fixed in the middle of the sides of the frame of the tympan, which make two small holes in the sheet during the first pressure. When the sheet is laid on to receive an impression from the second form, these holes are placed on the same points, so as to cause the two impressions to correspond. This is termed producing *register*; and unless good register is effected, the printing has a very indifferent appearance. However improved, a press of the above description could not impress more than half a sheet; and the practice was to first squeeze so much of the sheet, then relax the handle, wind the second half below the platten, and print it in turn. Thus, each sheet required four squeezes to complete it—two on each side. It is not without a degree of wonder that one reflects on the rudimentary clumsiness of the whole operation; and it seems not less marvelous, that it was by no other process that the best typography could be produced until the conclusion of the 18th century.

The first improvement upon the printing-press was made by the celebrated Earl of Stanhope. He constructed the press of iron, and that of a size sufficient to print the whole surface of a sheet, and he applied such a combined action of levers to the screw as to make the pull a great deal less laborious to the pressman; the mechanism altogether being such as to permit much more rapid and efficient working. A multitude of improvements speedily succeeded that of Earl Stanhope, in most of which the screw was dismissed, the pressure being generally effected by levers, or by the simple and efficient principle of straightening a joint. Among those which have gained a large share of approbation may

be mentioned the *Columbian press*, which is of American invention. This press, a representation of which is annexed, was brought to Great Britain in 1818 by Mr. George Clymer of Philadelphia, and patented.

The pressing-power in this instance is procured by a long bar or handle acting upon a combination of exceedingly powerful levers (*a, a, a, a*) above the platten; the return of the handle or levers being effected by means of counterpoises or weights (*c, c*). For ease and facility of *pull*, this press is preferred by most work-

Fig. 2.—Columbian Press.

men; and certainly the powerful command which the leverage enables the workman to exercise, is favorable to delicacy and exactness of printing—his arm feeling, as it were, through the series of levers to the very face of the types. In the present day, the old wooden press of Blaeu is entirely discarded from use.

To secure good printing, the following points are essential.

1. The types, carefully set, fixed with precision in forms, rendered level all over, so that all parts may be pressed alike, and the whole properly cleaned by a wash of potash lye.
2. A uniform inking of the surface, to give uniformity of color.
3. The paper damped equably, neither too much nor too little, so as to take an impression easily and evenly.
4. An equable, firm, and smart pressure, and with that degree of steadiness in the mechanism that the sheet shall touch and leave the types without shaking and blurring.
5. Care in adjusting the pointers (or gauge), so that perfect register may be secured in printing the second side.
6. Such frequency in changing *fly* or under-sheets on the tympan, that the first side shall not get dirtied by off-setting when printing the second side.
7. The laying of small patches on the tympan, where, from any inequality, it seems necessary to bring up the pressing surface to a thorough equality. A regard to all these circumstances constitutes the duty of a pressman. Bad printing is usually a result of old and worn types, want of proper cleaning, and an inferior kind of ink.

Printing by hand-presses of an improved kind continues to be used in the case of limited impressions, or where extra care and elegance in typography are required; also where machinery is unattainable; but in general circumstances, and more particu-

Fig. 3.—Flat-Pressure Machine.

larly to meet the demand for popular reading, printing is now executed by one or other of the varieties of cylinder-presses, moved by steam-power. Attempts have indeed been made to introduce flat-pressure machines, by which as many as 700 sides can be printed per hour; but these, though possessing the advantage of superseding severe bodily labor, and demanding only the services of a boy to lay on, and another to take off the sheets, have never become common. We offer a representation of a machine of this kind, made by J. Brown & Co., engineers, Kirkcaldy. More success, as regards flat-pressure machines, has been attained in the United States, where much fine work is provided by a clever adaptation of this kind, particularly in New York,

Boston, and Philadelphia. No flat pressure, however, can compete in point of speed, with the pressure which is communicated by revolving iron cylinders.

Cylinder-printing is the great modern fact in the history of the art, progress in which department has been facilitated by the invention of inking rollers made a certain composition, to supersede the old process of inking by stuffed balls (see *ROLLERS*). In 1790, Mr. Nicholson, the editor of the *Philosophical Journal*, procured a patent for certain improvements in printing, which patent embodies almost every principle since so successfully applied to printing-machines; and although he did not carry his views into practical effect, little has been left for subsequent engineers to do, but to apply, in the most judicious manner, the principles he laid down in his patent.

Whether Mr. Nicholson's ideas were known to Mr. König, a German, is now uncertain; but to him is due the distinguished merit of carrying steam-printing first into effect. Arriving in London about 1804, he first projected improvements on the common press; but after a while, he turned his attention to cylinder-printing. The first result of his experiments was a small machine, in which the two leading features of Nicholson's invention were embraced (the cylinders and the inking-rollers), which he exhibited to Mr. Walter, proprietor of the *Times* newspaper; and on showing what further improvements were contemplated, an agreement was entered into for the erection of two machines for printing that journal. Accordingly, on the 28th of November 1814, the public were apprised that the number of the *Times* of that date was the first ever printed by machinery, steam-propelled. At this period, but few persons knew of any attempts going on for the attainment of this object; whilst among those connected with printing, it had often been talked of, but treated as chimerical.

After the utility of cylindrical printing had been thus proved, it was thought highly desirable that the principle should be applied to printing fine book-work, where accurate register is indispensable. This was, to a certain extent, attained by using two large cylinders, the sheet of paper being conveyed from the bottom of the first cylinder (where it had received the first impression) by means of tapes, leading in a diagonal direction to the top of the second cylinder, round which the sheet was carried till the second side was printed. The first machine of this description was erected at Mr. Bensley's office, where it continued at work for some years, till more modern machines superseded it.

In the course of 1818, Messrs. Applegath and Cowper took out a patent for improvements in cylindrical printing machinery. The chief improvements were, the application of two drums placed betwixt the cylinders to insure accuracy in the register, over and under which the sheet was conveyed in its progress from one cylinder to the other, instead of being carried, as in König's machine, in a straight line from the one cylinder to the other; and the mode of distributing the ink upon tables instead of rollers—two principles which have secured to machines of this construction a decided preference for fine work. Machines of this construction were made by Applegath and Cowper for the principal printing establishments in London, Paris, Edinburgh, and many other cities; and it is nearly upon the model of their machines that other manufacturers now construct their steam-presses for the execution of ordinary book-work. Printing-machines may be divided into two distinct classes—those for printing book-work, in which register is required, and those for printing newspapers, in which register is not sought for, and speed is of first consequence.

Applegath and Cowper's book-machine, as just mentioned, remains the best of its kind. The machine, moved by steam-power,

Fig. 4.—Book-Machine.

from which the annexed engraving is taken, is one of this description. It is about 15 feet long by 5 broad, and consists of a very strong cast-iron frame-work, secured together by two ends and several cross-bars. To this frame all parts of the machine are fixed.

In external figure, as seen in the cut, it is a large apparatus, of imposing appearance. On approaching it when at work, we

perceive two cylinders, as large as hogsheads, revolving on upright supports; two smaller cylinders or drums revolving above them; and beneath, within the framework, a table, on which lie the types at both ends, going constantly backward and forward. A belt from a steam-engine, acting upon a shaft in the frame, gives motion to the whole apparatus. It will further be observed that a boy, marked *a* in the cut, is standing on the top of some steps feeding in sheets of paper, each of which, on being delivered, is swept round the first cylinder *b* (being held on by tapes), gets its impression below from the types, is carried over and betwixt the drums above, and then brought round on the second cylinder *c*; now it gets its second side printed, and issuing into the space between the cylinders, is seized by the boy *d*, who lays it on a table, completely printed. The whole operation is accompanied with a loud noise, from the revolving of the cylinders, the working of the notched wheels, and the driving of the table to and fro by a rack beneath, but without any strain on the mechanism, or risk of injury to the attendants. On minutely examining the parts, we observe that at each end there is an apparatus of rollers taking ink from a duct or reservoir of that material, and placing it upon a portion of the moving table beneath; here other rollers distribute it, while others take it off and roll it upon the pages of types, ready for each impression.

The two printing cylinders are nearly nine feet in circumference each, and are placed about two feet apart. They are accurately turned, so that the surfaces of the type-carriages and the cylinders may be perfectly parallel. The axis of each cylinder works in brass bearings in the upright framework, where, by means of screws, the degree of pressure with which the cylinders are allowed to rest upon the types may be regulated to any degree of nicety.

The cylinders have a continuous rotary motion towards each other, given by two large toothed wheels, whilst the type-carriages move backward and forward under them. The movements are so contrived that the type-carriages shall have gone and returned to the same point during the period that the cylinders have made one entire revolution; consequently, each successive impression is taken from the types by the same part of each cylinder. The two drums placed between the cylinders are for the purpose of causing the sheet of paper to pass smoothly and accurately from one printing cylinder to the other. To preserve the sheet in its proper place on the cylinders, and carry it forward through the different parts of its journey from the hand of the one boy to that of the other, there is an extensive apparatus of tapes, some of which are observable in the cut. These tapes are half an inch broad, and are formed into a series of endless bands, arranged at certain distances apart, so as to fall into the interstices and margins of the forms, and therefore escape being crushed between the types and the cylinders. The machine may be stopped at any instant by turning the handle of a lever. Such is the form of the machine that has printed the present work.

Many modified varieties of the cylinder machine have been introduced; the most important of them is the *Gripper*. In this machine the types are laid on a traveling table like that described above; the cylinder which gives the pressure is reduced to 12 or 16 inches in diameter, the drums are dispensed with, and the tapes are replaced by a contrivance called a gripper. This consists of a series of brass grips like fingers arranged along, and fixed to the cylinder; these seize the sheet at the proper moment, and retain it till it is delivered printed. The single gripper is supplied with points for registering. In the double or perfecting variety, the sheet is delivered from the first cylinder into the grippers of the second. There are many varieties of gripper machines; the most popular are the Wharfedale, a single, and the double gripper, named after its maker, M. Marinoni of Paris. They produce good work, and are well adapted for general purposes.

Non-registering machines for rapid printing are of various kinds, according to the degree of speed which is demanded. In those first introduced, the principle was that of pressure by a cylinder on a form of types laid upon a table, which was passed beneath it by a forward and retrograde motion; the inking being effected as in the above described perfecting machines. Having received one side by this means, the sheets were afterwards printed on the second side; such second impression containing the news up till the latest hour of going to press. This species of single cylinder printing-machine was well adapted for newspapers of which only a few thousand copies were wanted; and for this purpose, it is still in use, particularly in provincial towns in Great Britain. As presses of this sort, however, do not usually yield more than 4000 or 5000 impressions per hour, they are quite unfitted for printing newspapers having a circulation of 20,000 copies and upwards, the whole of which must be promptly produced by a certain hour every morning.

The liberation of newspapers from the obligatory penny-stamp in 1855, caused so great an increase of circulation, that none of the ordinary processes, including that just referred to, was at all adequate for the work required. Recourse had to be made to an

entirely new method of printing, the invention of which is due to Richard M. Hoe of New York.

Hoe's process consisted in placing the types (for which stereotype plates were afterwards substituted) on a horizontal cylinder revolving on its axis, against which the sheets were pressed by exterior and smaller cylinders. The pages of type were arranged in segments of a circle, each segment forming a frame that could be fixed on the cylinder. These frames were technically called *turtles*. By the ingenious contrivance of making the brass rules that separate the columns of a bevelled or wedge shape, the thinner edge being towards the surface of the turtle, the form of type was

lence of printing only one side at a time, and the multiplication of the feeding cylinders introduced too many complications. A great improvement was inaugurated by the plan of printing from curved stereotype plates and a continuous roll of paper; in the Exhibition of 1851, Mr. Thomas Nelson of Edinburgh exhibited a machine of this kind. The invention was not, however, found suitable for book-work, and its practicability for newspapers was not at first realized. But after much experimenting, printing from the web by means of curved stereotype plates was successfully carried on. The method was carried to great perfection in a new machine, the 'Walter,' contrived between 1863 and 1868 by

Fig. 5.—Hoe's Machine.

susceptible of being tightened up and made firm. The forms occupied only a portion of the main cylinder, the remainder affording space for the inking apparatus. The smaller surrounding cylinders for effecting the pressure were arranged in a framework, in connection with slopes, by which the sheets were fed in blank, and came out printed on one side. The size of the main cylinder, the number of exterior cylinders, and the rate of speed determined the number of impressions printed per hour. Such

the manager of the *Times* printing establishment. The 'Walter' machine (to which a folding-machine was subsequently attached) is represented in fig. 6.

A reel of tightly rolled paper, just as it leaves the mill, is placed at one end of the machine, is damped while passing between small cylinders, and is then led between the first and second of four cylinders, placed one above the other, where it receives its first impression from the stereotype cast of the first cylinder. The

Fig. 6.—The Walter Printing Press,

was the method of working Hoe's rotary machines, which, as wanted, were made with 2, 4, 6, 8, or 10 subsidiary cylinders. The first introduced into Europe (with the exception of one made for the Paris newspaper, *La Patrie*, in 1848) was one with six cylinders for printing *Lloyd's Weekly Newspaper* in London, in 1857. Some idea of the process of working may be obtained from fig. 5, representing a rotary machine with six feeders. Such a machine with its six feeders, each laying in sheets at the rate of 2000 per hour, could deliver 12,000 impressions in the hour; and those with 8 and 10 cylinders in proportion.

About the time that the Hoe machines came commonly into use, another great advance was made in the art of rapid printing. The Hoe machine, with all its advantages, still retained the inconven-

paper then returns backward between the second and third cylinders; and passing forward again between the third and fourth, receives on its other side the second impression from the stereotype plates of the lowest cylinder. The roll is next cut into sheets, and the sheets numbered by an index. Carried up to the top of the machine, the sheets descend perpendicularly, and are thrown alternately backwards and forwards onto boards held by two lads. These, with the striker, who starts the machine, are the sole attendants necessary. The paper travels at the rate of 1000 feet per minute, and the finished sheets are delivered at the rate of 12,000 copies and upwards per hour. Repeated experiment has proved that good work may be done at the rate of 17,000 copies per hour. The other web-printing machines differ

more or less considerably in idea or details from that just described. The 'Bullock,' which is the invention of an American, has also, done excellent book-printing at the rate of 12,000 sheets per hour. The 'Victory,' nearly contemporaneous with the 'Walter,' differs from it in several points. It does not damp the paper; it has only a single delivery; but it delivers the finished sheets ready folded. The 'Prestonian' will print from type, whereas all other web-machines print only from stereotype. One of the most recent web-printing patents is the Hoe web-machine, which is also very favorably spoken of.

By the introduction of the steam-presses which we have now described, the profession of the printer has within these few years undergone a most extraordinary revolution; and although fewer hand-pressmen are now employed than formerly, the increase of employment to compositors, engineers, bookbinders, booksellers, &c. must be very great. The principal advance in the profession has been since the year 1832, when the printing of cheap literary sheets rose into importance; and, by a fortunate coincidence, the patents of various machines having about the same time expired, a new impulse was given to the trade. The making of printing machines has in itself become a great business. The printing-office is a factory; and the interior of one of those concerns usually presents a remarkable spectacle of industry, animate and inanimate, which to a stranger leaves a lasting impression on the memory.

PRINTING. In Printing, a remarkable American invention was brought into use in 1867. It is called the Matrix Compositor, and is only adapted for stereotyping, by making impressions on thick, soft paper of the letters in the order required, and then taking casts of the same in metal as usual. The peculiarity of this machine is, that it brings up any letter the compositor wishes to its right place in the line by simply touching the key which answers to that letter, in an arrangement like the front of a piano, each key being marked with its corresponding letter. At the moment the letter is brought to its place, it is made to press into the paper; and in this way the composition proceeds with only one alphabet of fixed types, which are made of steel to bear the pressure. With practice, a good compositor will work this machine, and thus form the matrix of the stereotype plates, as fast as he could set up the ordinary movable types. The saving in time and the wear of type is therefore very considerable.

PRINT-WORKS, in point of law, are regulated by the statutes 33 and 34 Vict. c. 62, and 37 and 38 Vict. c. 44, so far as regards the labor of children, young persons, and women; and the statute applies to all buildings where persons are employed to print figures, patterns, or designs upon any cotton, linen, woollen, worsted, or silken yarn, or woven or felted fabric, not being paper. The works are subject to the inspection of the factories inspectors, to whom particulars of the business and place are to be duly sent. Children under 10 years of age are not to be employed. No child under 14, or female, is to be employed during the night. Children under 14 must be sent by the parent to school for at least 60 days in the year, and certificates of these school attendances must be obtained before a child can be employed. A child between 13 and 14 ranks as a young person if holding a certificate of proficiency in reading, writing, and arithmetic. A register is to be kept of all the persons employed, and the times of employment; and the employment of any one contrary to the act, subjects the occupier of the works to a penalty.

PRI'OR. See **MONASTERY.**

PRIOR, MATTHEW, an English poet, was born, it is supposed, in London, where his father was a joiner, on the 21st July 1664. He was educated, through the liberality of an uncle, at Westminster School; and in 1682, he was sent by the Earl of Dorset, whose friendship he had formed, to St. John's College, Cambridge. Here he took his B.A., obtained a fellowship, and made the acquaintance of Charles Montagu, afterwards Earl of Halifax, in conjunction with whom he produced *The City Mouse and Country Mouse*, written to ridicule Dryden, in which it did not in the least succeed, although it lives yet in virtue of its own wit, polish, and grace.

After 1688, P. was introduced to court by the Earl of Dorset, and was appointed secretary to the embassy which was sent to the Hague in 1690. His conduct gave satisfaction to King William; and the lucky and well-mannered poet was appointed afterwards to several posts of a similar description. He was a favorite at the courts of Holland and France.

In 1701, P. entered parliament; and soon after he deserted the Whigs, and went over to the Tory party. In 1711, he was sent by government to Paris with private proposals for peace, and on his return, he brought with him one of the French ministers, who was invested with full powers to treat. At P.'s house, shortly after, the representatives of the British government met the French plenipotentiary; and his connection with this meeting was made the ground of a charge of treason, on which he was committed to prison, but released after a confinement of two

years, without a trial. He had now nothing to live by except his fellowship and his wits. The publication of his poems by subscription, however, brought him 4000 guineas; and at the same time, Lord Harley, son of the Earl of Oxford, bought a small estate in Essex, and conferred it on him for life. At the age of 57, he died at the seat of the Earl of Oxford, September 18, 1721. A monument was erected to him in Westminster Abbey.

P. was one of the few poets who was also a diplomatist and man of the world. He filled his public offices with credit to himself, and he had the knack of making friends amongst those who had the giving of places and pensions. His poems, which comprise odes, songs, epistles, epigrams, and tales, are not much read. He has no fire, no enthusiasm, but everything is neat, pointed, well turned; and his lighter pieces are graceful and witty. If there is little inspiration in his verse there are the polish and felicity of a scholar and man of society.

PRIS'CIAN (Lat. *Priscianus*), surnamed **CÆSARIENSIS**, either because he was born or educated in the town of Cæsarea, is perhaps, in point of reputation, the first of Latin grammarians, though one of the last in point of time. He belongs to the middle of the 5th c., if he is not even considerably later, for he is mentioned by Paulus Diaconus as a contemporary of Cassiodorus (468—562 A.D.). He taught Latin at Constantinople, probably to the imperial court, for he enjoyed a government salary. The work which has mainly preserved his name is his *Commentariorum Grammaticorum Libri XVIII.*, dedicated to his patron the consul Julianus. The first 16 books treat of the different parts of speech as conceived by the ancients; the remaining two are devoted to syntax, and in one MS. bear the separate title of *De Constructione libri duo*. P.'s Commentary is, for the time, a solid and comprehensive work, the production of a man of great learning and good sense, and is enriched with quotations from many Greek and Latin authors no longer extant. The epitome executed by the German bishop, Rabanus Maurus (flor. in the 9th c.), was very popular in the middle ages. Besides the Commentary, B. wrote six smaller grammatical treatises, and two hexameter poems of the didactic sort, *De Lavde Imperatoris Anastasii*, and a free translation of the *Periegesis* of Dionysius. The first edition of P. appeared at Venice (1470); the best is that by Krehl (2 vols., Leip. 1819—1820).—The phrase, 'to break the head of Priscian,' means to grossly violate the rules of grammar.

PRISCILLIAN, the author, or rather the chief propagator in Spain, during the latter part of the 4th c., of the doctrines professed by the sect known from his name as **PRISCILLIANISTS**. The first seed of their doctrines is said to have been carried into Spain by a Memphian named Marcus. P. was a man of noble birth; and by his eloquence and ascetic life obtained so much consideration, that a numerous party, including some priests, and at least two bishops, attached themselves to his school. His doctrine was substantially that of the Manichæans (q. v.). He taught expressly the *Dualism* and the *Docetism* of that sect, and it is equally certain that he adopted the moral consequences as to marriage, &c., by which they had rendered themselves obnoxious even to the civil authorities in the East and Africa. He was warmly opposed by two bishops, Idacius and Ithacius; and the council of Cæsar-Augusta (Saragossa) having in the year 380 condemned his doctrines, a decree for his banishment was issued in the same year. He not only obtained, however, a reversal of this decree, but succeeded in affecting the banishment of his chief opponent, Ithacius. By an appeal to the usurper Maximus at Treves Ithacius caused P. and several of his followers to be brought to trial, and put to death in 385; a proceeding which was regarded with so much abhorrence by St. Martin of Tours, St. Ambrose, and other bishops, that they separated from the communion of Ithacius. The sect did not die out with its founder, though there was a considerable reaction against it at the close of the 4th c.; and at all times through the mediæval period we find its traces under various names and forms, especially in the north of Spain, in Languedoc, and in Northern Italy.

PRISM, in Geometry, a solid figure which can be most easily conceived of if we imagine a number of plane figures (triangles, quadrilaterals, &c.) exactly similar in form and size to be cut out of paper or any thin plate, and piled one above the other, and then the whole pile to become one body. It will thus be seen that the top and bottom of the prism are similar, equal, and parallel to each other, and that the sides are plane figures, rectangular if the prism be 'right' (i. e., if in the above illustration the pile of plane figures be built up perpendicularly), and rhomboidal if the prism be 'oblique' (i. e., if the pile slope to one side); but under all circumstances the sides of a prism must be parallelograms. The top and bottom faces may be either triangles, squares, parallelograms, or quadrilaterals of any sort, or figures of 5, 6, 7, &c. sides, provided only both are alike; and the number of sides in the plane figure which forms the top or bottom, of course determines the number of faces of the prism; thus, in a triangular prism, there are 5 faces in all (3 sides and 2 ends); in

a quadrangular prism, 6 faces (4 sides and 2 ends), &c. If two prisms, one being 'right,' and the other 'oblique,' have their bases of equal area, and be of the same vertical height, their solid content is the same, and is found by multiplying the area of the base by the vertical height. The Parallelepiped (q. v.) is a quadrangular prism, and the cube is a particular case of the parallelepiped.—**PRISM**, in Optics, is a triangular prism of glass or other transparent substance, its two ends being isosceles triangles, and having most frequently a very acute vertical angle, which gives the prism the appearance of a long wedge. The prism is a most important instrument in experiments on the refraction of light, and, in the hands of the most eminent optical philosophers, has been the means of largely adding to the science of optics. See **REFRACTION**.

PRISON DISCIPLINE means the method in which criminals, or other persons subjected to imprisonment are managed. In this, which is its original sense, prison discipline, as actually practised, may be good or bad in the estimation of the person speaking of it. Of late, however, the term has obtained a new meaning, having been used to express not merely the practice of ruling prisons, but the science of properly ruling them. It has gone even further, and sometimes has been used to express the principles of penal administration, or the philosophy and practice of punishment. This has arisen from the circumstance, that gradually other punishments have been dropped in this country, and detention within edifices and the grounds attached to them has become almost the only method of punishment for crimes. Torture, exposure in the pillory, and other like dedications of the offender to public vengeance, have been long abandoned as barbarous. Death-punishment has been much narrowed in its application; and transportation, apart from any question as to its effectiveness, has been rendered impracticable, except within a very narrow compass. We get nothing from the practice of the times anterior to Christianity, nor yet from that of the middle ages, to help us in estimating modern systems of prison discipline. They are a development of civilization; and, contradictory as it may seem to say so, of personal liberty. The institution of slavery renders any such system unnecessary. It removes the function of punishing ordinary criminals from the public administration of the affairs of a state, and places it in private hands. Hence, we have no criminal law, properly speaking, coming down to us from antiquity. The *corpus juris*, so full of minute regulations in all matters of civic right, has very little criminal law, because the criminals became slaves, and ceased to be objects of the attention of the law. When imprisonment became a function of the state in the administration of justice, it was often carelessly, and hence tyrannically, exercised, because the practice of awarding it as a punishment arose more rapidly than the organization for controlling its use. On several occasions, grave abuses have been exposed by parliamentary inquiries and otherwise in the practice of prison discipline in this country.

The exertions of Howard, Mrs. Fry, and other investigators awakened in the public mind the question, whether any practice in which the public interest was so much involved, should be left to something like mere chance—to the negligence of local authorities, and the personal disposition of jailers. The tendency lately has been to regulate prison discipline with extreme care. The public sometimes complain that too much pains is bestowed on it—that criminals are not worthy to have clean well-ventilated apartments, wholesome food, skilful medical attendance, industrial training, and education, as they now have in this country. There are many arguments in favor of criminals being so treated, and the objections urged against such treatment, are held by those who are best acquainted with the subject to be invalid; for it has never being maintained by any one that a course of crime has been commenced and pursued for the purpose of enjoying the advantages of imprisonment. Perhaps those who chiefly promoted the several prominent systems expected from them greater results, in the shape of the reformation of criminals, than any that have been obtained. If they have been disappointed in this, it can, at all events, be said that any prison in the now recognized system is no longer like the older prisons, an institution in which the young criminals advance into the rank of proficients, and the old improve each other's skill by mutual communication. The system now received is that of separation, so far as it is practicable. Two other systems were tried—the silent system and the solitary system. The former imposed entire silence among the prisoners even when assembled together; the latter endeavored to accomplish their complete isolation from sight of or communication with their race. By the separate system, the criminals are prohibited from communicating with each other; but they are visited by various persons with whom intercourse is more likely to elevate than to debase—as chaplains, teachers, scripture-readers, the superior officers of the prison, and those who have external control over it.

PRISONERS OF WAR are those who are captured from the enemy during naval or military operations. By the laws or rec-

ognized principles of war, the entire people of a vanquished town, state, or nation become the absolute property of the victors; but civilization has greatly modified this stern rule, and except when a country is devastated for military reasons, it is rare for non-combatant citizens to be subjected to penalties of conquest, beyond the levying of contributions in money or provisions. The combatants who have laid down their arms become prisoners of war. Their lives and liberty are at the disposal of their conquerors, and even in modern times, their lives are sometimes taken, as, for instance, when Napoleon put the Turkish prisoners to death at Jaffa in 1799; otherwise, prisoners of war are kept in confinement until peace ensues, or they are exchanged for prisoners of their conqueror's nation, held in captivity by their own countrymen. It is unusual to subject prisoners of war to penal discipline; but the loss of liberty and hard fare (for, of course, they are allowed no more than a bare subsistence) render captivity sufficiently irksome. In ancient times, the treatment of prisoners of war was far more severe. In the Greek wars, it was no uncommon thing to put the whole adult male population of a conquered state to the sword, while the women and children were enslaved. Although the putting to death of prisoners became less frequent, they and their families were commonly reduced to slavery to as recent a period as the 18th century. About that time, the more humane custom of exchanging prisoners came into practice. Notwithstanding frequent exchanges, large numbers of prisoners accumulate during war. In 1811, about 47,600 French were prisoners in England, while 10,300 English languished in the prisons of France. See **PAROLE**.

PRISRE'ND, a town of European Turkey (Albania), capital of a district, on the Rieka, 80 miles east of Scutari. It is one of the most beautiful, rich, and industrious towns in Turkey, with a citadel situated upwards of 1100 feet above sea-level. It contains an immense number of bazaars, and carries on an active trade in flints, saddlery, glass, copper, and steel wares. Among its edifices are 15 mosques. Pop. 35,000.

PRISTINA, a town of European Turkey, in the vilayet of Monastir, 30 miles north-north-east of Prisrend, stands on a hill, and is the most considerable town in old Servia. Pop. 12,000.

PRISTIS. See **SAWFISH**.

PR'ITHU is the name of several legendary kings of ancient India. It is, however, especially one king of this name who is the favorite hero of the Purān's. His father was Ven'a, who perished through his wickedness; for when he was inaugurated monarch of the earth, he caused it to be everywhere proclaimed that no worship should be performed, no oblations offered, and no gifts bestowed upon the Brahmans. The R'ishis, or Saints, hearing of this proclamation, entreated the king to revoke it, but in vain; hence they fell upon him, and slew him. But the kingdom now being without a king, as Ven'a had left no offspring, and the people being without protection, the sages assembled, and consulted how to produce a son from the body of the dead king. First, then, they rubbed his thigh; from it, thus rubbed, came forth a being called Nishāda; and by this means the wickedness of Ven'a having been expelled, they proceeded to rub the right arm of the dead king, and by this friction, engendered P., who came forth resplendent in person, and in his right hand the mark of the discus of Vishnu, which proved him to be a universal emperor, one whose power would be invincible even by the gods. The mighty P. soon removed the grievances of the people; he protected the earth, performed many sacrifices, and gave liberal gifts to the Brahmans. On being informed that, in the interval in which the earth was without a king, all vegetable products had been withheld, and that, consequently, the people had perished, he in great wrath marched forward to assail the earth. The earth, assuming the figure of a cow, fled before him; but seeing no escape from the power of the king, at last submitted to him, and promised to renew her fertility, provided that he made all places level.

P. therefore uprooted mountains, levelled the surface of the earth, established boundaries of towns and villages, and induced his subjects to take up their abode where the ground was made level. The earth now fulfilled her promise; and as P., by thus granting her new life, became, as it were, her father, she was henceforth called Pr'ithvi. However little the worth of this piece of popular etymology—for *pr'ithvi*, or *pr'ithot*, 'earth,' the feminine of *pr'ithu* (Greek *platū*) means etymologically 'the large' or 'wide'—the legend of P. itself seems to record some historical fact regarding the civilizing influences exerted by a great king of Hindu antiquity.

PRIVATE, the title applied in the British army to a common soldier of the cavalry and infantry, the corresponding rank in the artillery being gunner or driver, and in the engineers, the sapper. The pay of a private is one shilling a day in the infantry and 1s. 2d. in the cavalry—exclusive of a free ration or corresponding allowance. A private in the cavalry is sometimes called a trooper.

PRIVATEER, a ship owned by a private individual, which, under government permission expressed by a Letter of Marque (q. v.), makes war upon the shipping of a hostile power. To make war upon an enemy without this commission, or upon the shipping of a nation not specified in it, is piracy. Privateering was abolished by mutual agreement among European nations by the Treaty of Paris in 1856. It is doubtful, however, how far that abolition would stand in a general war, for privateering is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially when the latter offers the temptation of a wealthy commerce.

PRIVET (*Ligustrum*), a genus of plants of the natural order *Oleaceæ*, containing a number of species of shrubs and small trees with opposite leaves, which are simple and entire at the margin; the flowers small, white, and in terminal panicles; the calyx slightly 4-toothed; the corolla funnel-shaped and 4-cleft; the stamens 4, projecting beyond the tube of the corolla; the berries 2-celled. **COMMON P.** (*L. vulgare*) is a shrub growing in bushy places and about the borders of woods in the middle and south of Europe, and in some parts of Britain, now also naturalized in some parts of North America. It has half-evergreen, smooth, lanceolate leaves; and berries about the size of peas, black, rarely white, yellow, or green. The flowers have a strong and sweetish smell; the leaves are mildly astringent, and were formerly used in medicine; the berries, which hang on the shrub during winter, have a disagreeable taste, but serve as food for many kinds of birds; they are used for dyeing red, and with various additions, green, blue, and black. A rose-colored pigment obtained from them is used for coloring maps. The wood is hard, and is used by turners, and by shoemakers for making wooden pegs. **P.**, although not spiny, is much used for hedges, often mixed with some spiny shrub, or with beech. It bears clipping well, and grows well in the smoke of towns, also under the shade of trees.—A number of species of **P.** are natives of different parts of the East, and some of them have begun to be introduced into shrubberies in Britain.—All kinds of **P.** grow readily from cuttings.

PRIVILEGE (Lat. *privilegium*, from *privata lex*, a private law), a special ordinance or regulation, in virtue of which an individual or a class enjoys certain immunities or rights from or beyond the common provisions of the general law of the community. It differs from a *dispensation* inasmuch as the latter merely relaxes the existing law for a particular case or cases, while the privilege is a permanent and general right. Of ancient and medieval legislation, the law of privilege formed an important branch; and, in truth, the condition of the so-called 'privileged classes' was in all respects different, socially, civilly, and even religiously, from that of the non-privileged. In canon law, there were two privileges enjoyed by the clergy, which deserve especial notice from the frequency of the historical allusions to them—the 'privilege of the canon' (*privilegium canonis*) and the 'privilege of the forum,' *privilegium fori*. By the former, the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication against the offender; by the latter—known in England as 'benefit of clergy' (q. v.)—the clergyman was exempted from the ordinary civil tribunals, and could only be tried in the ecclesiastical court. Most of the purely civil privileges are abolished throughout Europe by modern legislation.

PRIVILEGED DEBTS, in the Law of Scotland, such debts as are first paid out of certain funds. Thus, when a man dies, a certain sum is allowed out of his estate for Mournings (q. v.) to the widow and children. In case of bankruptcy, servants' wages are privileged to a certain extent.—**PRIVILEGED DEEDS** are holograph deeds, which are exempted from the statute which requires other deeds to be signed before witnesses.

PRIVY-CHAMBER, GENTLEMEN OF THE, officers of the royal household of England, instituted by King Henry VII., to attend on the king and queen at court, and in their progresses, diversions, &c. For a number of years past, no services have been required of these officers, and no salary or fee is attached to the office. There are also four Gentlemen Ushers of the Privy-chamber, who are in regular attendance on the sovereign, waiting in the Presence-chamber, and attending on the royal person; they have the honor of conducting her Majesty, in the absence of the higher officers.

PRIVY-COUNCIL (*consilium regis privatum*), an assembly of advisers on matters of state appointed by the sovereign. The Privy-council of England existed at a very early period in the history of the country. It was in its beginning a small permanent committee, or minor council, selected by the king out of the great council, or parliament; and in its powers were included—what still forms one of its functions—the right to inquire into all offences against the state, and to commit offenders for trial be-

fore the proper courts of law. It also frequently assumed the cognizance of questions of private right, a practice against which the statute 16 Charles I. c. 10 was directed, enacting that neither king nor council should have any jurisdiction in matters regarding the estates and liberties of the subject, which should be tried in the ordinary tribunals of the country. The Council in early times consisted of the Chancellor, the Treasurer, the Justices of either bench, the Escheators, the Serjeants, some of the principal Clerks of the Chancery, and other members nominated by the king, who were generally bishops, earls, and barons. The Star-chamber and Court of Requests were both committees of Privy-council. The number of members, which had originally been 12, was gradually increased; and when the large number had become inconvenient, the sovereign sought the advice of a select body of the more influential among them.

Charles II. limited the number of councillors to 30, 15, of whom comprised the chief officers of state and the *ex officio* members, to whom were added 10 peers and 5 commoners named by the sovereign; and it was intended that the Council, thus remodelled, should practically resume its original duties, and have the control of every part of the executive administration. The Court of Privy-council has, however, long ceased to discharge the function of advising the crown on the general affairs of government and state policy, a select number of the body, under the denomination of the Cabinet Council, forming the recognized executive council of the crown. See **MINISTRY**. The list of privy-councillors now includes the members of the royal family, the Archbishops of Canterbury and York, the Bishop of London, the great officers of state, the Lord Chancellor and judges of the Courts of Equity, the Chief Justices of the Courts of Common Law, the Ecclesiastical and Admiralty Judges, and the Judge Advocate, several of the Puisne Judges, the Speaker of the House of Commons, the Ambassadors, some of the Ministers Plenipotentiary and Governors of Colonies, the Commander-in-chief, the Master-general of the Ordnance, the First Lord of the Admiralty, and generally also a Junior Lord of the Admiralty, as well as necessarily all the members of the Cabinet. The Vice-president of the Board of Trade, the Paymaster of the Forces, and the President of the Poor-law Board, are also generally members of the Privy-council; and sometimes other persons who have filled responsible offices under the crown. It is now understood that no members attend the deliberations of Council except those who are especially summoned. In ordinary cases, only the ministers, the great officers of the Household, and the Archbishop of Canterbury are summoned; but on some extraordinary occasions, summonses are sent to the whole Council—this was last done to receive her Majesty's communication of her intended marriage. Meetings of Council are usually held at intervals of three or four weeks at her Majesty's residence; and the attendance of six privy-councillors at least, with one of the clerks of Council, is considered necessary to constitute a council.

A privy-councillor must be a natural-born subject of Great Britain. The office is conferred by the sovereign's nomination, without any patent or grant, and complete by taking the oath of office. The duties of a privy-councillor, as defined by this oath, are—to the best of his discretion, duly and impartially to advise the king; to keep secret his council; to avoid corruption; to strengthen the king's council in all that by them is thought good for the king and his land; to withstand those who attempt the contrary, and to do all that a true councillor ought to do to his sovereign lord. The office of privy-councillor formerly fell by the demise of the crown; but by 6 Anne, c. 7, the Privy-council continues to exist for six months longer, unless sooner determined by the successor. Immediately on the decease of the sovereign, the Privy-council now assembles and proclaims his successor, the Lord Chancellor affixing the Great Seal to the proclamation. The members of the Privy-council are then re-sworn as council of the successor, and take the oath of allegiance, after which a privy-council is held, and the sovereign makes a declaration of his designs for the good government of the realm, and subscribes the requisite oaths.

The king in Council, or a committee of the Lords of Council, have been empowered by various statutes to issue orders which are to have the force of law, parliament thus delegating its authority to regulate such matters as may be more conveniently regulated by Order in Council. In cases of extreme public emergency, at a time when parliament was not sitting, Orders in Council have sometimes been issued in contravention of the existing law, and the indemnification of parliament has afterwards been sought. See **ORDERS IN COUNCIL**. The sovereign, with the advice of the Privy-council, is also empowered to issue proclamations, which, however, must be in accordance with, and in furtherance of, the law of the land. See **PROCLAMATION**.

Almost every act of importance done by the sovereign in person is performed in Council—such as declarations of, or public engagements by, the sovereign, and consent to marriages by members of the royal family. Among the functions of the Privy-

council are also the appointment of sheriffs in England and Wales, and the issuing of orders for the laying on or removing of quarantine, or for granting reprisals, or for embargoes. The sovereign in Council has still more ample authority in all that relates to the colonies, including the making and enforcing of laws in such colonies as have no representative assemblies; and approving or disallowing the legislative acts of such as do possess them.

A large part of the business of the Privy-council is transacted by committees, to which petitions and other matters are submitted by the queen in Council. Among the permanent committees of Privy-council are the Board of Council for Trade and Foreign Plantations (see *TRADE, BOARD OF*); the Committee of Council for Education, appointed in 1839, to distribute the sum voted annually for educational purposes; and the Judicial Committee of Privy-council. This last-named committee consists of the Lord President, Lord Chancellor, Lords Justices, Lords of Appeal, and other great judicial officers, as well as privy-councillors who have held such offices, with any two other privy-councillors who may be named by the sovereign. It was established by 3 and 4 Will. IV. c. 41, for the purpose of deciding certain questions of right of privilege, particularly with regard to the colonies, and hearing certain appeals. Among these were appeals from the Courts of Equity, colonial appeals, and the causes reviewed by the Court of Delegates. The powers of the Privy-council were enlarged by 6 and 7 Vict. c. 68. Part of its jurisdiction was, however, abolished by the Judicature Act of 1873 and subsequent years. This act still left, for a time, the Privy-council the Court of Appeal for the British colonies and dominions abroad, though it was provided that appeals thence should ultimately be referable to the newly constituted Court of Appeal (see *APPEAL*).

To the latter court were transferred appeals from the Court of Admiralty and in Orders in Lunacy. But the Privy-council is still the great court of appeal in ecclesiastical matters. The acts of committees of the Privy-council are designated Acts of the Lords in Council, in contradistinction from Orders in Council, made by the sovereign, who is personally present, by advice of the Privy-council. The crown may refer to a Committee of Council any petition or claim of right for which the ordinary tribunals afford no remedy. The Lords of Council constitute a Court of Record for the investigation of offences against the state, the offenders being committed for trial before the ordinary tribunals. Certain state investigations, not of a criminal kind, have also been held to fall within their jurisdiction, such as the inquiry into the insanity of George III., the claim of Queen Caroline to the crown as consort of George IV., and questions regarding alleged illegal marriages of the royal family.

The Privy-council is styled collectively 'Her Majesty's most Honorable Privy-council.' Privy-councillors are entitled to the designation 'Right Honorable' prefixed to their name, and take precedence next after Knights of the Garter. The personal security of a member of Privy-council was formerly guarded by certain statutes, visiting with fine a blow struck in his house or presence, and making it felony to conspire against him or assault him in the execution of his office; but these immunities were done away with by 9 Geo. IV. 81.

The Lord President of the Council is the fourth great officer of state, and is appointed by letters-patent under the Great Seal. The office is very ancient, and was revived by Charles II. in favor of the Earl of Shaftesbury.

Scotland possessed a Privy-council, which was merged in that of England by 6 Anne, c. 6. There is a Privy-council for Ireland, which at present consists of 58 members, who are sworn pursuant to a sign-manual warrant directed to the Lord Lieutenant.

PRIVY-COUNCIL (COMMITTEE OF) ON EDUCATION. Till within the last forty years, primary education in England was left in the hands of individuals and societies. The only societies of importance which endeavored to overtake the enormous educational destitution which prevailed, were the British and Foreign School Society, founded under the patronage of George III.; and the National Society, of more recent date. The first-mentioned Society endeavored to get rid of all religious difficulties by avoiding the use of catechisms in the school, and confining themselves to the use of the Bible alone. The Church party, however, felt that in accepting for the children of the country a religious training so vague, they were untrue to their principles, and would probably fail to secure for the young any efficient religious instruction at all. Accordingly, the National Society was set on foot as a specially Church Institution. The object of both these societies was, by means of contributions collected from benevolent persons, to aid in the foundation and maintenance of elementary schools throughout England and Wales.

The prevailing destitution was, however, too widespread to be met by voluntary associations, and it consequently became neces-

sary that the State should take some share in the education of the people. Parliamentary-grants of small amount were made, which were distributed by the Treasury under regulations issued in 1833, the chief of which was as follows: 'That no application be entertained by the Treasury unless a sum be raised by private contribution equal, at least, to one-half of the total estimated expenditure.' These grants were for the purpose of erecting school-buildings. In 1839, after considerable opposition, it was resolved to increase the parliamentary grant, and to appoint a Committee of Her Majesty's Privy-council to administer it.

On the 3d June 1839, an order of Council laid down, that the grants of previous years not yet appropriated, as well as the grant for the current year, should be expended for the erection of schools, and that £10,000 voted for Normal Schools in 1835 should be given in equal proportions to the British and Foreign and the National Societies. The Privy-council Committee did not at first contemplate aiding any schools but those in connection with the two Societies which we have just named; but in September of 1839, they resolved to aid other schools, where special circumstances prevented their affiliation to the Societies. In the course of a year or two it came practically to this, that *all schools* were aided *in which the Bible was daily read from the authorized version.*

The various religious denominations, under the influence, partly, of the strong pecuniary inducement held out by the Committee of Council, now began to exert themselves to erect schools, and to claim state aid. The Committee of Council, seeing the large probable increase in the number of schools requiring to be maintained partially out of the state funds, had their attention specially directed to the principles of their administration, and the conditions on which alone aid was to be granted. The first measure of importance was the appointment of inspectors of schools. These were appointed by Her Majesty; but the Church of England was permitted to exercise a veto on those nominated for the inspection of Church schools, and the dissenting education committees were allowed a similar privilege with reference to those nominated for dissenting schools. No school was to be admitted to government aid in any form which did not declare its willingness to submit to inspection. The next measure of importance was the determining of the conditions on which aid should be given, first, for the erection, and secondly, for the maintenance of schools. Grants for the former purpose were given in proportion to the number of children to be educated and the amount of money raised by private contribution.

In 1846, the first step seems to have been made towards making grants for the *maintenance* of schools. It was resolved to apprentice promising boys and girls, the young persons (who were to be at least thirteen years of age on appointment) giving assistance in the school-work, and receiving separate instruction for one hour and a half daily from the principal teacher.

They were paid salaries rising from £10 by annual increments of £2, 10s. to £20. The teacher received a small extra payment for giving this instruction. The subjects were defined in a broad-sheet prepared by the Department, and embraced Euclid, algebra, and the common subjects taught in schools. The apprenticeship was intended to be five years in length; but, in cases of exceptional ability, the period was considerably shortened. These young people were called 'pupil-teachers.'

In contemplation of the close of the apprenticeship of pupil-teachers, it was further resolved to grant them a scholarship or bursary, to enable them to pursue their studies at one of the numerous male and female normal schools which had come into existence; and at the conclusion of their training, to allow a grant of money to the normal school to which they had resorted. The Queen's Scholarship, as the bursary was called, was fixed at £25 for a first class, and £20 for a second, was tenable for two years; and the grants to the normal school at £30, £25, and £20, according as they had trained the student for one, two, or three years—two-thirds of these sums being allowed in the case of female students. It was further necessary to contemplate the completion of the normal-school training, and to endeavor to secure for the public service the well-trained teachers who had been educated at the public expense. Accordingly, it was resolved to grant to teachers sums ranging from £15 to £30 per annum (and two-thirds of these sums in the case of females), provided the school-buildings in which they taught, and the character of their teaching, were satisfactory to Her Majesty's inspectors.

A condition, afterwards added, was, that the teacher should receive from local sources, including school-fees, not less than twice the amount paid by government, of which one-half should be from voluntary subscriptions. The amount which the teacher might claim, besides being payable only on the conditions stated above, was made partially dependent on the grade of certificate obtained at the normal school. Certificates are also granted on conditions specified in the Code which is issued annually by the Department.

What is known as 'The New Code' was introduced by Mr. Robert Lowe in 1862. It has undergone alterations every year;

but it still continues to be founded on the principle of 'payment by results.' The teachers receive no direct payment from the Department; but are left to make their own conditions with their managers. A grant is paid for every child's average attendance (6s.); and further payments are made for success in reading, writing, and arithmetic (8s. for each pass). To encourage a higher course of instruction, a further grant of 4s. on the average attendance is paid if the children are satisfactorily taught in two subjects (selected from geography, grammar, history, and needle-work); and extra sums are given for success in Latin, French, English literature, science, &c. The grants are paid to the managers, and the distribution is left entirely in their hands. Pupil-teachers must now be 14 years of age on appointment, and are apprenticed for not more than four years.

These are the principles of administration which continued to regulate the action of the Privy-council, up to the date of the English Education Act of 1870, and the Scotch Education Act of 1872. The consequence has been an astonishingly rapid increase in the number of primary schools and normal schools or colleges; of the latter, there are about 40 in England and Scotland.

The above sketch of the Privy-council system applies also to Scotland, with this difference, that when the Revised Code was first issued, the opportunity was regarded as a favorable one for considering whether there were not peculiarities in the educational system of Scotland, which might make it advisable either to separate educational administration there from that of England, or to found a national system on the basis of the time-honored system of parochial schools—excellent in themselves, but too few to supply the wants of the country. With these objects in view, a Royal Commission was issued in 1864, to take evidence on the whole question as it affected Scotland, and this Commission reported in 1868. The Education Act of Scotland has separated the public schools—and in some cases the burgh schools—from their connection with the ecclesiastical bodies of the country, and placed them in the hands of elected school-boards. Privy-council grants are now paid to these Boards, since the passing of the last Act.

The minutes of the Privy-council Committee, or, as it is now called, 'The Education Department,' are constructed under the Education Acts above referred to, but they do not materially differ in principle from the code of 1863. There was up to 1878 a Scotch Educational Department in London, with a board in Edinburgh; but the latter is now abolished, while the former has been strengthened with additional powers. The Codes which regulate the elementary schools of England and Scotland are now almost identical; and the alterations made yearly seem to indicate the opinion of the Department that the primary instruction of the whole country should be conducted on the same lines.

PRIVY-PURSE, KEEPER OF THE, an officer of the royal household charged with the payment of the private expenses and charities of the sovereign.

PRIVY-SEAL, the seal appended to grants which are afterwards to pass the Great Seal, and to documents of minor importance which do not require the Great Seal. The officer who has the custody of the Privy-seal was at one time called the Keeper, and afterwards the Lord Privy-seal. As early as the reign of Edward III., he was a member of the king's council, and a responsible minister of the crown. The Lord Privy-seal is now the fifth great officer of state, and has generally a seat in the cabinet. His office is conferred under the Great Seal during pleasure. Since the reign of Henry VIII., the Privy-seal has been the warrant of the legality of grants from the crown, and the authority for the Lord Chancellor to affix the Great Seal. Such grants are styled letters-patent, and the office of the Lord Privy-seal is one of the departments through which they must pass to secure their validity. Until recently, all letters-patent for the grant of appointments to office under the crown, of patents of invention, charters, naturalizations, pensions, creation of honors, pardons, licenses in mortmain, &c., required to pass from the Signet Office to the Privy-seal Office, in the form of Signet bills, verified by the Signet Seal and superscription, and the signature of the clerk of the Signet. These Signet bills were the warrant for the Privy-seal; and on the Privy-seal being attached to them, they were forwarded to the Lord Chancellor, by whom the patents were engrossed and completed in the office of the Great Seal. The statute 11 and 12 Vict. c. 82, abolished the Signet Office, and enacted that warrants under their royal sign-manual, prepared by the Attorney-general and Solicitor-general, setting forth the tenor and effect of the letters-patent to be granted, addressed to the Lord Chancellor, and countersigned by one of the principal secretaries of state, should be a sufficient authority for the Privy-seal being affixed; and that the sign-manual so signed, countersigned, and sealed, should be sufficient warrant to the Lord Chancellor to pass letters-patent under the Great Seal. This statute abolished

the previously-existing offices of Clerks of the Signet and Clerks of the Privy-seal.

There is a Privy-seal in Scotland, which is used to authenticate royal grants of personal or assignable rights. Rights such as a subject would transmit by assignation, are transmitted by the sovereign under the Privy-seal.

PRIZE, PRIZE-MONEY, terms having reference to property captured from an enemy, or to enemy's property captured from a neutral in time of war. The circumstances under which such capture is justifiable are stated under **CAPTURE**, as regards naval operations; military prize and its distribution to the army are described under **BOOTY**. It remains only, therefore, to notice the procedure taken in respect to vessels and property captured by the navy. On a ship being taken, she must be sent to a port belonging to the capturing power, where the Court of Admiralty, on full evidence, adjudicates whether she be lawful prize or not. If the decision be affirmative, the prize is then sold; or if a ship-of-war, (a certain allowance per gun is granted by the state. The produce of the sale or grant is lodged in the hands of the Accountant-general of the Navy, for distribution to the officers and men who assisted at the capture. The net produce of the sale or grant is first divided rateably among any ships (if there be more than one) concerned in the capture. The share of each ship is then divided into eight equal parts. If she were employed under the orders of a flag-officer, he gets one-eighth, and the captain two-eighths; if not, the captain has three-eighths; one-eighth is divided among the lieutenants and officers of corresponding relative rank; one-eighth is shared by the junior commissioned officers and warrant officers; one-eighth goes to the midshipmen and petty officers; and the remaining two-eighths among the seamen, marines, and boys.

PRIZE-COURT is a court which adjudicates the property in vessels captured at sea from a belligerent; and the rule is, that when a captor brings home a prize, the tribunal of his own country has jurisdiction to declare whether he is entitled to it, which decision is binding everywhere. A prize-court differs from other courts in this, that the property of foreigners is brought within its jurisdiction, not by consent, as is implied with regard to the ordinary municipal courts, but by force. By natural law, one would suppose that the tribunals of the captor's country are no more the rightful exclusive judges of captures in war, made on the high seas, from under the neutral flag, than are the tribunals of the neutral country. Nevertheless, such is the rule of international law, which vests the jurisdiction in the prize-court. In Britain, the court is created by commission under the Great Seal, and the judge of the Admiralty Court is usually appointed. Lord Stowell was the judge during the French war, and, during the time he sat as judge, delivered many important judgments in this difficult branch of the law.

PRIZZI, a town of Sicily, in the province of Palermo, and 30 miles south-by-east from Palermo. It is of considerable commercial importance. Pop. (1871) 8835.

PRO'A, commonly known as the 'flying proa,' is a peculiarly-shaped canoe in use by the natives of the Eastern Archipelago, and especially by the Ladrone pirates. It is about 30 feet in length by 3 in width, and has the stem and stern equally sharp, so as to sail backward or forward without being turned round.

Proa.

One side is flat, and in a straight line with the stem and stern; the other side is rounded, as in ordinary boats. This peculiar formation would make it liable to be easily upset, were it not for a framework which projects to windward, supporting a weight which counterbalances the pressure of the wind on the sail. The

sail resembles the ordinary lug-sail, and is formed of mat. Slight variations from this form are found, but the principle of construction is the same.

PROBABILISM (Lat. *probabilismus*, a barbarous technical word, from *probabilis*, probable), in Roman Catholic theology, means the doctrines regarding the use of so-called 'probable opinions' in guiding the conscience as to the lawfulness or unlawfulness of any particular action. The word came prominently into discussion in the 17th c., and seems now fully accepted as a technical name. As the ground of the doctrine, it is assumed that, in human actions, absolute certainty is not always attainable as to their lawfulness or unlawfulness. Short of this certainty, the intellect passes through the stages of 'doubt' and of 'probability.' In the former, it is swayed between conflicting views, so as to be unable to decide, or even to approach towards deciding, what is true. In the latter, although there is a conflict of views, yet the reasons in their favor are not so equal that the intellect cannot see preponderating motives in favor of the truth of one or the other. Moreover, in the conflict of views, another element will arise, as to their comparative 'safety,' that is, the greater or less danger of moral culpability which they involve; and this greater or less moral 'safety' of a view may, or may not, coincide with its greater or less 'probability.'

The doctrine of 'probabilism' is founded upon these distinctions; and it presents itself in four different schools, all of which agree in professing that it is lawful, in certain cases, to act upon opinions which are merely 'probable.' Opposed to all these four, is the school of *Anti-probabilism*, which rejects altogether the use of probable opinions, and requires that an opinion shall be absolutely morally certain, in order that it may be lawful to act upon it. The four schools of probabilism are called: *Probabilism Simple*, *Aqui-probabilism*, *Probabiliorism* (from *probabilior*, more probable), and *Tutorism* (from *tutor*, more safe). The first holds that it is lawful to act upon any probable opinion, no matter how slight its probability. The second requires that the opinion shall be 'solidly probable,' but holds that, provided it be really probable, it is lawful to act upon it, even though the conflicting opinion should be equally probable. The third, in the conflict of probable opinions, will only permit us to act on the more probable of the two; but permits this even when the less probable adverse opinion is the 'more safe.' The fourth requires that in all cases the more safe opinion shall be followed, even when the less safe opinion is much the more probable. It is commonly said that the system of probabilism is modern; but this is only true of the discussions regarding it, for the doctrine itself, in some of its forms, is as old as the study of ethics, even considered as a moral science. The disputes regarding it arose with the science of casuistry, when men, in the 16th and 17th centuries, began to reduce morals to a system. It formed a leading subject of the controversy between the Jesuits and the Jansenists, although it is a great, while it is a very common, mistake to suppose that all the Jesuits were probabilists, and that all the Jansenists were opposed thereto. Very few Jesuits, indeed, were of the school which is chiefly assailed in the *Provincial Letters* (see PASCAL), that of Probabilism Simple.

Without entering into the history of this very curious controversy, it will be enough to say that the Roman Church, while condemning the two extremes—the extreme of anti-probabilism, which excludes all use even of the most probable opinions, and the lax extreme of simple probabilism, which accepts even the slightest probability as sufficient—has left the intermediate opinions for free discussion. The great modern master on the subject is St. Alfonso de Liguori, whose system may be described as a kind of practical probabiliorism, in which, by the use of what are called reflex principles, an opinion which *objectively* is but probable, is made *subjectively* the basis of a certain and safe practical judgment. There can be no doubt that the system of probabilism has been pushed by some individual divines to scandalous extremes; but it is only just to add that these extremes have been condemned by authority in the Roman Church; and that, on the other hand, the principles of the higher Roman schools of probabilism are substantially the same as those of all moralists, whether of the old or of the new schools of ethics.

Protestants, however, and with them some Roman Catholics, reprobate probabilism in all its schools or forms, as a mere scheme for the delusion of conscience and excuse or justification of immorality. They maintain the Scriptural or Christian rule, and the only rule of true morality, to be that no man is entitled on any account to do that of which he doubts whether it is contrary or agreeable to the law of God. Every man must often choose between two courses, as to which is the most expedient; but this they hold to be a totally different thing. It is also urged against the probabilists, that they make the authority of *doctors*, or learned theologians, sufficient justification for a man's doing that which otherwise he would deem it unlawful to do; asserting that it will keep him safe at the judgment seat of God.

PROBABILITY, THE MATHEMATICAL THEORY OF. Of all mathematical theories which can be made in any sense popular, this is perhaps the least generally understood. There are several reasons for this curious fact, of which we may mention one or two. *First*.—As by far the simplest and most direct elementary illustrations of its principles are furnished by games of chance, these have been almost invariably used by writers on the subject; and the result has been a popular delusion, to the effect that the theory tends directly to the encouragement of gambling. Nothing can be more false than such an idea. Independent of moral considerations, with which we have nothing to do here, no arguments against gambling can be furnished at all comparable in power with those deduced from the mathematical analysis of the chances of the game. *Second*.—In many problems, some of them amongst the easiest in the theory, the very highest resources of mathematics are taxed in order to furnish a solution. One reason is very simple. The solutions, however elementary, involving often nothing but the common rules of arithmetic, sometimes lead to results depending upon enormous numbers, and very refined analysis is requisite to deduce *easily* from these what would otherwise involve calculations, simple enough in character, but of appalling labor. Higher mathematics here perform, in fact, something analogous to *skilled labor* in ordinary manufactures. The simplest illustration of this is in the use of LOGARITHMS (q. v.), which reduce multiplication, division, and extraction of roots to mere addition, subtraction, and division respectively. Powerful as logarithms are, analysis furnishes instruments almost infinitely more powerful. The large numbers which occur in probabilities are usually in the form of *products*, and we may exemplify the above remarks as follows.

To find the value of the product 1.35.7, no one would think of using anything but common arithmetic; but, if he were required to find the value of 1.35.7.9.....49, he would probably have recourse to logarithms, *merely to avoid useless labor of an elementary kind*. But in very simple questions in probabilities, it may be requisite to find (approximately) the value of a product such as 1.35.7.9.....23999—i. e., that of the first 12,000 odd numbers. No one in his senses would dream of attempting this by ordinary arithmetic, but it is the mere labor, not the inherent difficulty, which prevents him. Few would even attempt it by means of logarithms; for, even with their aid, the labor would be very great. It is here that the higher analysis steps in, and helps us *easily* to a sufficiently accurate approximation to the value of this enormous number. Thus, it appears that this objection to the study of the theory of probabilities is not applicable to their principles, which are very elementary, but to the mere mechanical details of the processes of solution of certain problems. *Third*.—There are other objections, such as the (so-called) religious one, that 'there is no such thing as chance,' and that 'to calculate chances is to deny the existence of an all-ruling Providence,' &c.; but, like many other similar assertions, these are founded on a total ignorance of the nature of the science; and, therefore, although pernicious, may be safely treated with merited contempt. The authors of such objections remind us of the Irishman who attempted to smash Lord Rosse's great telescope, because 'it is irreligious to pry into the mysteries of nature.'

It appears to us that the best method of explaining the principles of the subject within our necessarily narrow limits, will be to introduce definitions, &c., as they may be called for, in the course of a few elementary illustrations, instead of elaborately premising them.

First Case.—The simplest possible illustrations are supplied by the common process of 'tossing' a coin, with the result of 'head' or 'tail.' Put H for head, and T for tail. Now, the result of one toss, unless the coin should fall on its edge (which is practically impossible), *must* be either

H or T.

Also, if the coin be not so fashioned as to be more likely to fall on one side than the other (as, for instance, is the case with loaded dice), *these events are equally likely*; or, in technical language, *equally probable*. To determine numerically the likelihood or the probability of either, we must assign some numerical value to *absolute certainty*. This value is usually taken as *unity*, so that a probability, if short of absolute certainty, is always represented by a proper fraction. Suppose that p (a proper fraction) represents the probability of H, then evidently p is also the probability of T, because the two events are equally likely. But one or other *must* happen; hence, the sum of the separate probabilities must represent certainty. That is,

$$p + p = 1, \text{ or } p = \frac{1}{2}.$$

Thus we have assigned a numerical value to the probability of either H or T, by finding what proportion each bears to certainty, and assigning to the latter a simple numerical value.

Suppose as a contrast, the coin to be an unfair one, such as those sometimes made for swindling purposes, with H on each side. Then we *must* have in one toss

H or H;

i. e., H is *certain*, or its probability is 1. There is no possibility of T, and therefore its probability is 0. Absolute impossibility is therefore represented by the numerical value of the probability becoming zero.

Second Case.—Suppose a 'fair' coin to be tossed twice in succession. The event *must* be one of the four—

H, H; H, T; T, H; or T, T.

Now all four are evidently equally likely; i. e., their probabilities are equal. But one of them *must* happen—hence the sum of their probabilities amounts to certainty, or 1. That is, each of the

four cases has a probability measured by the fraction $\frac{1}{4}$.

Here we may introduce a new term. What are the *odds* against H, H? The answer is, the chance or probability of H, H is $\frac{1}{4}$; that is, *one* case in *four* is favorable, hence *three* are unfavorable, and the odds are said to be 3 to 1 against the event. In general the *odds against any event is the ratio of the probability that it will not, to the probability that it will, happen.*

Thus, in the first case above, the odds against H in one toss are even.

Third Case.—What is the chance of throwing both head and tail in two tosses of a coin? Remark that this is *not* the same question as, 'What is the chance of head followed by tail, in two tosses?' The latter question was answered in the *Second Case*,

for the chance of H, T was there shown to be $\frac{1}{4}$. The present

event contemplates *either* H, T or T, H—and its probability is therefore $\frac{1}{4} + \frac{1}{4}$, or $\frac{1}{2}$, since each has the separate probability $\frac{1}{4}$.

Or we may reason thus: Of the four possible cases of two tosses of a coin, *two* give both head and tail—all *four* are equally probable—hence the probability is 2 in 4, or 1 in 2; i. e., $\frac{1}{2}$.

Fourth Case.—What is the chance of throwing H in two tosses? Remark that this is *not* the same question as, 'What is the chance of H *once only* in two tosses?' The latter question is that of the *Third Case* merely put in a different form. Nor will it do to answer our question thus:

$$\text{Chance of H in first throw} = \frac{1}{2}.$$

$$\text{Chance of H in second throw} = \frac{1}{2}.$$

$$\text{Therefore chance of H in two throws} = \frac{1}{2} + \frac{1}{2} = 1.$$

For by this reasoning it would appear that we *must* get head once at least in two throws; which is obviously absurd, for we may have T, T.

This very elementary example shows how delicate the reasoning in this subject is, and how liable one is to make (complacently) the most preposterous mistakes.

The error of the above process is introduced by the fact, that we have not considered that *if H be obtained in the first throw, our object is attained, and no second throw is required.* The correct work is this—

$$\text{Chance of H in first throw} = \frac{1}{2}.$$

If H come, the game is finished.

Chance of T in the first throw, in which

$$\left. \begin{array}{l} \text{case we must throw again} \\ \text{Subsequent chance of H in second throw} \end{array} \right\} = \frac{1}{2}$$

Combining these, we have—

$$\text{Chance of H at second throw only} = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}.$$

$$\text{Add chance of H at first throw} = \frac{1}{2}.$$

$$\text{Sum, or chance of H in two throws} = \frac{3}{4}.$$

A simpler method is this. The possible throws, all equally likely, are, as before—

H, H; H, T; T, H; and T, T.

The first three of these satisfy the requirements of the question; i. e., the required event has 3 chances in 4 in its favor, or its

$$\text{probability is } \frac{3}{4}.$$

Fifth Case.—The chance of H in any one throw is $\frac{1}{2}$ (by *First*

Case). The chance of H, H is $\frac{1}{4}$ (*Second Case*). Now $\frac{1}{4} = \frac{1}{2} \times \frac{1}{2}$;

i. e., the chance of *joint occurrence of two independent events*, at least in this simple case, *is the product of their separate probabilities.* Contrast this with the principle, already several times employed, that the *probability of an event which may arise from one of a number of causes (no two of which can coexist), is the sum of the separate probabilities.* Simple proofs of these statements, in all their generality, will now be given, along with various other important propositions.

(A) If an event may occur in p ways, and fail in q ways—all being equally likely—the probability of its happening in one trial is

$$\frac{p}{p+q}, \text{ and of its failing, } \frac{q}{p+q} \text{—and the odds in its favor are } p:q.$$

The simplest way of conceiving this, and many other hypothetical cases, is to suppose *one* ball to be drawn from a bag which contains a number of balls, differing from each other in color, or in some other quality not distinguishable by the touch. Suppose the bag to contain p white balls (W), and q black ones (B), and *one* ball to be drawn; what is the chance of its being white?

Here there are p chances in favor of a white ball being drawn, and q chances against it—these being *all equally likely*, or having *equal probabilities*—the chance of W is therefore p in $p+q$; i. e., is expressed by the fraction,

$$\frac{p}{p+q}.$$

The chance against W is q in $p+q$, or,

$$\frac{q}{p+q}.$$

And the sum of these fractions is 1, or certainty, as it ought to be—for the ball drawn *must* be either W, or not W.

(B.) If an event may occur in p ways, and fail in q ways, all being equally likely—what are the chances of (a) its happening twice, (b) its happening the first, and failing the second, (c) its failing the first time, and happening the second, and (d) its failing twice, in two trials?

Taking the illustration in (A) above, we see that there are p independent ways of succeeding in the first case, and p in the second; hence, there are $p \times p$, or p^2 independent ways of *succeeding* twice. For any one of the first p may occur along with any one of the second. But the whole possible number of ways of *experimenting* twice is $(p+q)(p+q)$ or $(p+q)^2$; hence, the

$$\text{Chance of (a) i. e. succeeding twice, is } \frac{p^2}{(p+q)^2}.$$

$$\text{Similarly, chance of (b) is } \frac{pq}{(p+q)^2}.$$

$$\text{“ “ “ (c) is } \frac{qp}{(p+q)^2}.$$

$$\text{“ “ “ (d) is } \frac{q^2}{(p+q)^2}.$$

$$\text{The sum of these is } \frac{p^2 + 2pq + q^2}{(p+q)^2} = 1, \text{ as it ought.}$$

(C.) An attentive consideration of (B) shows us that when we have the independent probabilities of two events, the probability that they will jointly occur is the *product* of their separate probabilities.

$$\text{Thus, for W, in first trial, chance is } \frac{p}{p+q}.$$

$$\text{“ “ second “ “ “ } \frac{p}{p+q}.$$

Whose product is $\frac{p^2}{(p+q)^2}$; the probability of W in each of two successive trials.

Again, for W, in the first trial, chance is $\frac{p}{p+q}$.

“ B “ second “ $\frac{q}{p+q}$.

Whose product is $\frac{pq}{(p+q)^2}$, which is found above to be the chance of WB. And so on.

(D.) This may be generalized as follows—the process will be evident to all who can understand the very elementary algebra employed:

$$\text{Certainty} = 1 = \frac{(p+q)^n}{(p+q)^n} = \frac{p^n + np^{n-1}q + \frac{n \cdot n-1}{1 \cdot 2} p^{n-2}q^2 + \dots + q^n}{(p+q)^n}$$

by the Binomial (q. v.) Theorem of Newton. Now the parts of this expression—i. e.,

$$\frac{p^n}{(p+q)^n}, \frac{np^{n-1}q}{(p+q)^n}, \dots, \frac{q^n}{(p+q)^n}$$

represent, obviously, the chances of W n times, W $n-1$ times and B once, W $n-2$ times and B twice, , B n times, in n trials, where the order of occurrence is not considered.

If the order be considered, the chance of any arrangement, such as WBWBWBW, for instance, is evidently

$$\frac{p \cdot q \cdot p \cdot p \cdot q \cdot q \cdot p \cdot p}{(p+q)^8} = \frac{p^4 q^4}{(p+q)^8}.$$

But the chance of 4W and 4B in 8 trials, without respect to order, is as above, the term containing $p^4 q^4$ in the expansion of $(p+q)^8$, divided by $(p+q)^8$ —i. e.,

$$\frac{70 p^4 q^4}{(p+q)^8}.$$

To take a simple example: if there be 2W and 1B in a bag, and each ball be replaced immediately after drawing, the chance of

W 4 times in succession is $\frac{2^4}{3^4} = \frac{16}{81}$.

Of the particular combination WBWB, the chance is $\frac{2}{3} \cdot \frac{1}{3} \cdot \frac{2}{3} \cdot \frac{1}{3}$.
 $\frac{1}{3} = \frac{4}{81}$.

But the chance of W twice, and B twice, without respect to order,

is $6 \cdot \frac{2^2 \cdot 1^2}{3^4} = \frac{24}{81}$; the numerator of the fraction being the term of

$(2+1)^4$ which contains the product $2^2 \cdot 1^2$.

(E.) From the preceding results it is obvious that the probability of the joint occurrence of any set of independent events is the product of their separate probabilities.

(F.) We may vary the process by supposing that there are several bags, each containing some balls, which may be white or black; but the number in each bag, and the proportion of white to black, being any whatever. One ball only is to be drawn, what is the chance that it is W?

If n be the number of bags, the chance that the ball will be drawn from any particular bag is $\frac{1}{n}$ [see (A)]. And if in that bag there be p of W and q of B, the chance that W will be drawn from it is $\frac{p}{p+q}$ [see (A)].

Hence the chance that W is drawn, and from the particular bag is,

$$\frac{1}{n} \cdot \frac{p}{p+q} \text{ by (E).}$$

And the whole chance that W drawn is the sum of all the chances,

$\frac{1}{n} \cdot \frac{p}{p+q}$ for each of the bags.

Thus let there be five bags, containing respectively, WB, WW,

BB, WWB, WWW; our chance is found as follows: The chance of the ball being drawn from any particular bag is $\frac{1}{5}$, since all are equally likely to be chosen. Then, supposing the first chosen, the chance of W¹; if the third be chosen, the chance of W is 0, &c.

Hence on the whole, the chance of W is

$$\frac{1}{5} \cdot \frac{1}{2} + \frac{1}{5} \cdot 1 + \frac{1}{5} \cdot 0 + \frac{1}{5} \cdot \frac{2}{3} + \frac{1}{5} \cdot 1 = \frac{19}{30}.$$

(G.) Hence, if an event may happen in consequence of any one of a set of causes, such that the action of one excludes that of the others, its probability is the sum of the products formed by multiplying the chance of the action of each cause by the chance that that cause, if operating, will produce the desired event.

We might easily extend this very simple series of results, but our limits restrict us to an attempt to show more the extent of the subject than the details of its application to any particular set of questions. We therefore reluctantly pass to the consideration of an inverse problem or two.

(H.) An event has occurred, which may have arisen from any one of a set of mutually exclusive causes: to determine the probability that any particular cause was the efficient one—the probability of the event's happening, when any particular one of the causes operates, being known.

As a simple example will show us how to proceed in the most general case, take the 5 bags of (F) above. The chances of draw-

ing W from them are, in order, $\frac{1}{2}, 1, 0, \frac{2}{3}, 1$. Suppose W has been

drawn, what is the chance that it was drawn from any particular bag? It is obvious that the chance of W having been drawn from any particular bag is proportional to the chance that, if that bag had been selected, W would have been drawn from it. Hence, if p_1, p_2, p_3, p_4, p_5 be the chances that the several bags furnished the W actually drawn, we have

$$p_1 : p_2 : p_3 : p_4 : p_5 :: \frac{1}{2} : 1 : 0 : \frac{2}{3} : 1,$$

with the additional condition, that the ball must have been drawn from one of the bags, and therefore

$$p_1 + p_2 + p_3 + p_4 + p_5 = 1.$$

From these, by elementary algebra, we have

$$p_1 = \frac{3}{19}, p_2 = \frac{6}{19}, p_3 = 0, p_4 = \frac{4}{19}, p_5 = \frac{6}{19}.$$

And a very simple application of algebra will easily conduct us to the general formula for any such case.

(I.) If the nature of a cause is known only by its results, we have an interesting case of simultaneous application of the direct and inverse methods.

Thus, a bag contains 3 balls, each of which may be either black or white. A ball has been drawn from it on two occasions—replacing before drawing—and on each of these occasions the ball was W. What is the chance that a third drawing will give a black ball?

The contents of the bag are obviously one of the following—viz., W,W,W; W,W,B; or W,B,B—since it contains one W at least. Now if WWW be the contents, the probability of the observed event (two W in succession) is $1 \times 1 = 1$.

$$\text{If W,W,B, } \frac{2}{3} \times \frac{2}{3} = \frac{4}{9}.$$

$$\text{If W,B,B, } \frac{1}{3} \times \frac{1}{3} = \frac{1}{9}.$$

Hence the probabilities that these are, respectively, the contents of the bag are as $1 : \frac{4}{9} : \frac{1}{9}$, or as 9:4:1; and are therefore $\frac{9}{14}$,

$\frac{4}{14}$, and $\frac{1}{14}$ respectively, since their sum must be 1 or certainty.

Now for the chance of B in the third drawing; if WWW be the contents (of which the chance is $\frac{9}{14}$), the chance of B is 0. Hence

we have one part of the chance for B, viz., $\frac{9}{14} \times 0 = 0$. Similar-

ly, the other parts are $\frac{4}{14} \times \frac{1}{3} = \frac{4}{42}$, and $\frac{1}{14} \times \frac{2}{3} = \frac{2}{42}$. The whole chance of B in the third drawing is therefore

$$0 + \frac{4}{42} + \frac{2}{42} = \frac{1}{7}$$

As exercises on the above principles, we will take first a few simple questions from Life Assurance, the subject to which, above all others, the elementary theory of Probability has been of the most indispensable service. We purposely choose the very simplest that the subject can furnish, but they are quite sufficient to show the great value of the theory.

A Table of Mortality (q. v.) gives the numbers alive at each successive year of their age out of a given number of children born. If A_n and A_{n+1} be the numbers in the table corresponding to the n^{th} and $n+1^{\text{th}}$ years of age; the inference from the table is, that, of A_n individuals now alive, and of n years of age, A_{n+1} will live one additional year at least. Hence the chance that any one of them die during the year is

$$\frac{A_n - A_{n+1}}{A_n}$$

Call this $1 - p$, then p is the chance that any one of them will survive the year.

Questions. Of two individuals, one n years old, and the other n_1 , what are the chances that

- (a.) One only lives a year?
- (b.) One, at least, lives a year?
- (c.) Both do not live a year?

Calling the individuals A and B, the chance of A living out the year is p , and the chance of his dying within the year is $1 - p$. For B, these are p_1 and $1 - p_1$. Hence

$$\begin{aligned} \text{(a) A lives and B dies—chance} & \quad p(1 - p_1) \\ \text{B lives and A dies—chance} & \quad (1 - p)p_1 \end{aligned}$$

Hence answer to (a) is $p + p_1 - 2pp_1$.

(b.) This includes, in addition to the conditions of (a), the chance that both survive, which is pp_1 .

Hence answer to (b) is $p + p_1 - pp_1$.

(c.) In this case the chance that both do live a year is pp_1 . Hence chance of (c) is $1 - pp_1$.

As another very instructive example, let us take the question, 'In how many throws of a die is it even betting that an ace will be thrown?'

This may, of course, be worked directly, proceeding in the following manner:

$$\text{Chance of ace in first throw} = \frac{1}{6}$$

Then, remembering that there is no second throw unless the first fails,

$$\text{Chance of ace in second throw} = \frac{5}{6} \cdot \frac{1}{6}; \text{ and so on.}$$

$$\text{Hence the odds against ace in 1 throw are } 5 : 1.$$

and so on. But great care is requisite in this mode of working the problem.

The simplest procedure is this:

Chance against ace in 1 throw	$\frac{5}{6}$
“ “ “ 2 throws	$\frac{25}{36}$
“ “ “ 3 “	$\frac{125}{216}$
“ “ “ 4 “	$\frac{625}{1296}$

$$\text{Hence odds against ace in 1 throw } 5 : 1.$$

$$\text{“ “ “ 2 throws } 25 : 11.$$

$$\text{“ “ “ 3 “ } 125 : 91.$$

$$\text{“ “ “ 4 “ } 625 : 671.$$

That is, the odds are considerably against ace occurring in three throws, being about 11 to 8; while in four they are slightly in its favor, as 29 : 27 nearly. One is sure, therefore, of winning in the long run, if he can get any one to give him repeatedly an even bet against ace appearing in four throws of a die.

It is to be observed that when we say 'in the long run,' we mean that the most likely event may not be that which will happen in the first trial, nor perhaps for many trials (because, unless its probability is 1 or certainty, it is of course, possible that it may

never occur). But what is certain is this, that if a sufficient number of trials be made, we can have any amount of probability (short of certainty) that the ratio of the number of successful trials to the number of failures, will be in the ratio expressed by the odds in favor of success in any one trial.

And this introduces us to another department of the theory of Probabilities, what is called *Expectation*. We begin with a simple case, not involving what is called *Moral Expectation*, to which the next example will be devoted.

Suppose A, B, and C have made a pool, each subscribing £1; and that a game of *pure chance* (i. e., not dependent on skill) is to be played by them for the £3. What is (previous to play) the value of the expectation of each? By the conditions, all are equally likely to win the pool, hence its contingent value must be the same to each; and, obviously, the sum of these values must represent the whole amount in question. The worth of the expectation of each is therefore £1. That is, if A wishes to retire from the game before it is played out, the fair price which B or C ought to pay him

for his share is simply £1. But this is obviously $\frac{1}{3} \times £3$; i. e., the

value of the pool multiplied by his chance of getting it. Here we have taken an extremely simple case, because we have not room for the general proof (though it is closely analogous to that just given) that

The value of a contingent gain is the product of the sum to be gained into the chance of winning it.

So far, it has been assumed that the payment of his stake (which may be wholly lost) has not *morally* affected the position of any of the players; i. e., that the stake is a sum whose loss would in nowise embarrass him. And it is only with such cases that the strict mathematical theory can deal; for we cannot estimate with mathematical accuracy the value of the stake as depending on the fortune (the *possessions*, not the *luck*) of the player. The attempts which have been made to supply this apparent deficiency in the theory have, of course, not been very generally accepted. Still there is no doubt that two men of very unequal fortunes are placed in very different circumstances when they have subscribed equal sums to a pool which they have equal chances of gaining. The most commonly received method of *approximating* to a solution of such a question (for it is obvious that here we have left mathematical certainty behind) is that proposed by Daniel Bernoulli; which is, that the value of a small gain, or the inconvenience of a small loss, is directly proportional to the amount of the gain or loss (which is probably correct), and inversely proportional to the fortune of the person affected (which may be nearly true, except in very extreme cases). The application of this hypothetical principle necessitates, in general, the use of the integral calculus; but, to show the *mathematical folly* of gambling, we quote one of Bernoulli's results.

A, whose whole fortune is £100, bets £50 even with B on an event of which the chance is $\frac{1}{2}$. What is the moral value of A's

fortune after making the bet (and before it is decided)? By applying the above method, he finds it to be £87. Thus A, by making the bet, has depreciated by 13 per cent. the value of his property. This is an extreme case, of course; and the method employed in obtaining the result is questionable; still it is certain that no legitimate method could show that A had otherwise than impaired his fortune by entering upon any such transaction. This, of course, is on supposition that the bet is a *fair* one; if A be a swindler, and get from B more than the proper odds against the event, he may, of course, improve to any extent the value of his fortune. But such would be a question of flats and sharpers not a question of probability.

A very excellent example of *moral* as distinguished from *mathematical* probability is furnished by the famous 'St. Petersburg Problem.'

A and B play at heads and tails. A is to pay B £2 if H comes at the first throw, £4 if at the second and not before, £8 if at the third and not before; and so on, doubling each time. What should B pay (before the game) for his expectation?

Applying the mathematical method, we see that

$$\text{Chance of H at first throw} = \frac{1}{2};$$

in which case B gets £2, of which the contingent value is $\frac{1}{2} \times £2 = £1$.

$$\text{Chance of H at second throw, and not before} = \frac{1}{4};$$

when B is to get £4, whose value is therefore $\frac{1}{4} \times £4 = £1$.

Chance of H at third throw and not before = $\frac{1}{8}$

contingent value of B's £8 is therefore $\frac{1}{8} \times £8 = £1$.

And so on, for ever.

Hence B's expectation (mathematical) is £1 + £1 + £1 + &c. for ever, or an infinite sum. Now it is obvious that no man, in his senses, would pay even a moderately large sum for such a chance. Here the *moral* expectation comes into play; but the mathematical solution is perfectly correct, if we interpret it properly. *It does not attempt to tell what will be the actual result in any one game—this is pure chance—but it tells us what will be the average to which the results of larger and larger numbers of games must continually tend.* In other words, if B. had an inexhaustible purse, he might safely pay any amount to A before each game, and be sure of winning in the long run, after an indefinitely great number of games were played. But this, though theoretically exact, is not applicable to mundane gambling—where limited purses and limited time circumscribe the field requisite for the proper development of the mathematical result.

Before quitting this part of the subject, we may give a couple of instances in which the mathematical theory may be easily tested by any one who has a little leisure. One of these we will develop at length, as a final instance of the simple calculations generally involved.

'To find the chance of throwing any given possible number with two dice.'

As the faces of the dice are numbered from 1 to 6—the smallest throw is 2, and the greatest 12.

In one throw, the chances are—

$$\text{For } 2 = 1 + 1; \frac{1}{6} \cdot \frac{1}{6} = \frac{1}{36};$$

the probabilities being multiplied (E) because the events are independent. For.

$$3 = 1 + 2, \text{ or } 2 + 1; \frac{2}{36};$$

$$4 = 1 + 3, 2 + 2, \text{ or } 3 + 1; \frac{3}{36};$$

$$5 = 1 + 4, 2 + 3, 3 + 2, \text{ or } 4 + 1; \frac{4}{36};$$

$$6 = 1 + 5, 2 + 4, 3 + 3, 4 + 2, \text{ or } 5 + 1; \frac{5}{36};$$

$$7 = 1 + 6, 2 + 5, 3 + 4, 4 + 3, 5 + 2, \text{ or } 6 + 1; \frac{6}{36};$$

Then, in the inverse order—

$$8 = 2 + 6, 3 + 5, 4 + 4, 5 + 3, \text{ or } 6 + 2; \frac{5}{36};$$

and so on—the fact being that if we read the *lower* sides of the dice when the throw is 8, they will give 6, and so on—the sum being always 14.

The mathematical expectation for any one throw is therefore

$$\frac{1}{36} \cdot 2 + \frac{2}{36} \cdot 3 + \frac{3}{36} \cdot 4 + \frac{4}{36} \cdot 5 + \frac{5}{36} \cdot 6 + \frac{6}{36} \cdot 7 + \frac{5}{36} \cdot 8 + \frac{4}{36} \cdot 9 + \frac{3}{36} \cdot 10 + \frac{2}{36} \cdot 11 + \frac{1}{36} \cdot 12$$

In all—

$$\frac{1}{36} (2 + 6 + 12 + 20 + 30 + 42 + 40 + 36 + 30 + 22 + 12); \text{ or } \frac{1}{36} \cdot 252 = 7.$$

The meaning of this is, *not* that we shall probably throw seven the first time, nor second, nor perhaps for many throws; but that if we throw a number of times, add the results, and divide by the number of throws, the final result will be more and more nearly equal to seven, the greater be the whole number of throws. It is very instructive to make the experiment, say on 100 throws of two dice, as in backgammon. If the mathematical result be not closely verified by such a trial, the dice are loaded; or, at least, are ill-made.

Another illustration, and a very excellent one, is furnished by the following theorem.

If the floor be ruled with equidistant parallel lines, and a straight rod, whose length is equal to the distance between any two contiguous lines, be dropped upon it at random, the chance

of its falling on one of the lines is $\frac{2}{\pi}$, where π is the ratio of the

circumference of a circle to its diameter (see QUADRATURE OF THE CIRCLE). The deduction of this result from the theory of Probabilities requires the use of the integral calculus, and cannot be given here; but we may put the above theorem to the test of practice in the following way. Let the rod be tossed a number of times, then the greater this number, the more nearly shall we have

Twice number of throws

Number of times the rod falls on a line = $\pi = 3.14159$, &c.;

and therefore, by simply continuing this process long enough, we may obtain as accurate a value as we choose of the ratio of the circumference to the diameter of a circle.

To show how the theory of Probabilities would tend, if generally known, to the discouragement of gambling, would require a treatise—as every species of game would have to be treated—we shall therefore only take one case, about as bad a one as can be. This is when a man makes a 'book' on a horse race, so as to 'stand to win,' whatever be the result of the race. This is, of course, immoral; for, as it can make no matter who accepts his bets, suppose them all taken by one individual. The latter must therefore have been 'done' into a complex transaction by which he is *certain to lose*. The method of making such a 'book' is simple enough; it consists mainly in betting *against* each horse. Thus, if three horses, A, B, C, are to start, and he can get the following bets taken—

£4 : £3 against A,
£5 : £4 " B;
£6 : £5 " C;

his book stands thus :

If A win, he wins £4 + £5 - £4 or £5.
" B " " £5 + £3 - £5 " £3.
" C " " £4 + £3 - £6 " £1.

Now, to examine this case, suppose the *correct* odds to have been laid against A and B, what ought in fairness to be the odds as regards C?

Chance of A winning is . . . $\frac{3}{7}$
" B " . . . $\frac{4}{9}$
Chance of A or B winning . . . $\frac{3}{7} + \frac{4}{9} = \frac{55}{63}$

Hence, chance of C winning = $\frac{8}{63}$; and therefore the legitimate

odds against C are 55 to 8, whereas our betting man has got a *fool* to accept 6 to 5.

The true cause of the detestation which attaches to gambling, is not so much the ruin, insanity, suicide, &c., in which it not unfrequently ends, as the fact, that a gambler's work in no case increases the wealth or comfort of the state; all it can effect is a more or less rapid and dishonest transfer of these from one state of distribution to another. It is as useless, so far as regards production, as the prison crank.

There is a common prejudice as to '*runs of luck*,' which are popularly supposed *not* to be compatible with the mathematical theory. This, also, is a complete delusion. To take a very simple case, the reader will easily see that, if he writes down all the possible cases which may occur in six tosses of a coin, the odds are 19 : 13 in favor of a run of three at least.

To give an instance of the principle of interpretation which we have several times above applied to the mathematical result—viz., that the greater the number of trials, the more nearly will the average result of these trials coincide with it—let us recur to heads and tails. Suppose a coin tossed ten times, and let Hⁿ stand for H n times, then we have

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{10} \\ = \frac{1}{2^{10}} \left(1 + 10 + \frac{10 \cdot 9}{1 \cdot 2} + \frac{10 \cdot 9 \cdot 8}{1 \cdot 2 \cdot 3} + \&c.\right)$$

of which the terms are [as in (D)] the probabilities of H¹⁰, H⁹T, H⁸T², &c. respectively; the order not being taken account of.

The largest term is the 6th, and its value is $\frac{252}{2^{10}} = \frac{252}{1024}$, or about $\frac{1}{4}$.

This is the chance of H⁶T⁴, without regard to order, in ten throws. Although the most probable result, inasmuch as the chances of H⁴

T⁴ and H⁴T⁶ are each about $\frac{1}{5}$ only, and those of the other possible combinations much smaller—yet it has not a very large chance. But the chance of a result *not deviating much from the*

most probable one, is very much larger: in the above case, the chance of having not less than 3H, and not less than 3T, is as much as $\frac{912}{1024}$. But this tendency of the bulk of the results to

coincide very closely with the most probable one, is much more evident as we take a greater and greater number of trials. Thus, in 100 trials with the coin, we have—

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{100} \\ = \frac{1}{2^{100}} \left(1 + 100 + \dots + \frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50} +, \&c.\right)$$

[Now we begin to see how the higher analysis comes in. Who is to work out by common arithmetic the value of the fraction $\frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50}$? Some calculating boy *might*, with no very enormous labor—but, wait a moment, we may wish to have the result of a million of trials, and what calculator (arithmetical) will tell us the value of

$$\frac{1,000,000 \times 999,999 \times \dots \times 500,001}{1 \times 2 \times \dots \times 500,000}]$$

In this case, the most probable result is $H^{50}T^{50}$, without regard to order, but its chance is only about $\frac{2}{25}$. [The exact value is $\frac{1}{2^{100}}$.

$\frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50}$] Had there been 1000 throws, the chance of $H^{500}T^{500}$ (the most likely combination) would have been about $\frac{1}{88}$. But, as the number of throws increases, the number of terms

grouped close to the largest in the expansion, and whose sum far exceeds that of all the rest, becomes a smaller and smaller fraction of the entire number of terms. Hence the chance that in 1000 tosses there should not be more than 600 nor less than 400 H, is much greater than that of not more than 60 nor less than 40 H in 100 throws; and so on.

Thus it is that all our statistical results, say the ratios of the numbers of births, marriages, suicides, &c. to the whole population—or that of the male to the female births—or that of the dead letters to the whole number posted, &c.—though perhaps never the same in any two years, yet fluctuate between very narrow limits. And thus it is that the theory of Probabilities has been the means of solidly establishing, beyond almost the possibility of failure, when properly applied, the inestimable securities afforded by life-assurance.

Another very important application of the theory is to the deduction of the *most probable* value from a number of observations (astronomical, meteorological, &c.), each of which is liable to error. We may confidently assert that, but for this, astronomy could not have taken the gigantic strides by which it has advanced during the present century. But the '*Method of Least Squares*,' as it is called, which is furnished for this purpose by the theory of probabilities, is far beyond the scope of elementary mathematics, and can therefore only be referred to here. Its fundamental features may be seen in the above process of determining the probability that the result of a number of trials shall lie within certain limits on each side of the most probable result.

The theory of Probabilities has been applied to many other important questions, of which we may mention only two—the value of evidence, and the probability of the correctness of the verdict given by various majorities in a jury. But for these, and for the further development of what we have given above from the simplest points of view, we must refer to the various treatises on the subject. Of these, the most accessible to an English reader are the very valuable works of Galloway and De Morgan. Poisson, Gauss, and especially Laplace, have also treated the subject in the most profound manner. But the difficulty of understanding Laplace's great work is such, that few have ever mastered it completely; and it is therefore particularly satisfactory that the late Professor Boole, in his *Laws of Thought*, has shown how to dispense with a great part of the analysis which renders Laplace's work so formidable.

PROBATE COURT is a court created in England in 1858, in lieu of the old Prerogative Courts, to exercise the exclusive jurisdiction in all matters touching the succession to personal estate. Since the Judicature Acts of 1873-75, the P. C. is included in the Probate, Divorce, and Admiralty Division of the new High Court of Justice. If a man at his death leaves a will, then it must be produced and verified, so as to prove that it is an authentic will, duly executed and signed in presence of witnesses, and

therefore that the right to the personal estate is vested in the executors named by the will. The will is sworn to by the witnesses, on being produced; and if the evidence is satisfactory, it is registered, and the original deposited in the court, when copies are made. This process is called proving the will, and the act of court is called the probate of the will. If there is no will, then the rule being, that the personal estate devolves on the next of kin and widow, if any, it is necessary that an application be made to the court to appoint one of the next of kin to be the administrator, and take charge of the payment of debts. This is called taking out administration, and the act of the court appointing the administrators is called letters of administration. Numerous difficulties often arise as to irregularities in the making of wills and as to the party entitled to administration, and it is the function of the Court of Probate to dispose of these.

PROBOSCI DEA, a section of *Pachydermata*, of which the characters are given under that head, contains one recent and one fossil genus, *Elephas* (see ELEPHANT) and *Mastodon* (q. v.); so that the P. seem not to have been numerous at any period of the world's history. Notwithstanding the great size of these creatures, comparative anatomists have pointed out various resemblances in their dentition, osteology, &c., to rodents.

PROBO'SCIS MONKEY. See NASALUS.

PROBUS, MARCUS AURELIUS, Emperor of Rome, was born at Sirmium, in Pannonia. His father, Maximus, served first as a centurion, and afterwards as a tribune in the Roman army, and died in Egypt, leaving to his only son a good name and a moderate income. P. early entered the army, and had the good fortune to attract the favorable notice of the Emperor Valerian, who elevated him before the legal period to the rank of tribune. His subsequent conduct justified his rapid promotion, for he greatly distinguished himself against the Sarmatians on the Danube, and subsequently in Africa, Egypt, Asia, Germany, and Gaul, winning golden opinions from Valerian's successors. Gallienus, Claudius II., Aurelian, and Tacitus. By the last-named emperor, he was appointed governor of the whole Asiatic possessions of Rome, and declared to be the chief mainstay of the Roman power; and such was the zealous attachment evinced for him by his soldiers, whose respect and love he had equally won by his firm discipline, by his care in providing for their wants and comforts, and his liberality in the distribution of plunder, that, on the death of Tacitus, they forced him to assume the purple; and his rival, Florianus, having been removed, P. was enthusiastically hailed emperor by all classes (276 A.D.). His brief reign was signalized by brilliant and important successes; the Germans, who, since Aurelian's time, had made Gaul almost a part of Germany, were driven out with enormous slaughter, pursued into the heart of their own country, compelled to restore their plunder, and to furnish a contingent to the Roman armies. Pursuing his victorious career, P. swept the inimical barbarians from the Rhætian, Pannonian, and Thracian frontiers, and forced Persia to agree to a humiliating peace. Various aspirants to the imperial purple were also put down.

On his return to Rome, P. celebrated these fortunate achievements by a triumph, and then, the external security of the empire being established, devoted himself to the development of its internal resources. The senate was confirmed in its privileges; liberal encouragement was given to agriculture; numerous colonies of barbarians were established in thinly-peopled spots, that they might adopt a civilized mode of life; and all branches of industry were protected and promoted. But P. was at a loss what to do with his army, as the Romans had now no enemies either at home or abroad; and fearing that their discipline would be deteriorated by a life of inactivity, he employed the soldiers as laborers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent; and a large body of troops, who were engaged in draining the swamps about Sirmium, giving way to these feelings, under the excitement produced by the presence of the emperor, murdered him, 282 A.D. P. possessed great military genius, combined with equal administrative talent, and added to these a wisdom, justice, and amiability equal to that of Trajan or the Antonines.

PROCESS is the system of action by which a court calls parties into court for purposes of litigation. There are numerous rules governing the steps of process, but these are all of a technical nature.

PROCESSION OF THE HOLY GHOST, that doctrine regarding the Third Person of the Blessed Trinity which teaches that as the Son proceeds (or is born) from the Father, so the Holy Ghost proceeds (or emanates) from the Father and from the Son, but as from one principle. The question of the origin of the Holy Ghost was not distinctly raised in the early controversies, which fell chiefly upon the Second Person. In the Creed of Nicæa, no

allusion whatever is made to the subject; and in the Creed of Constantinople, the Holy Ghost is said simply to 'proceed from the Father.' Nevertheless, this was understood in the Latin Church to mean that, as the Son proceeds from the Father, the Holy Ghost proceeds from both Father and Son; and in the course of the 7th and 8th centuries, the words 'and from the Son,' for greater distinctness, came to be added to the creed in several churches—as the West. In the controversy with the Latins, Photius (q. v.) took exception to this addition, as unauthorized, and made the addition one of the grounds for his charge of heresy against them, which was resumed on the consummation of the schism under Michael Cerularius. In the union of the Greek and Latin churches at Florence (1437), an article of agreement on this head was adopted, and the words *Filioque* were sung twice over both in Latin and in Greek, in the solemn mass which celebrated the union. But this union had no root in the popular mind, and the dispute still continues as of old to divide the churches.

PROCESSIONAL (Lat. *processionale*), the service-book which contains the prayers, hymns, and general ceremonial of the different processions. Many ancient books of this class have been preserved. The processional approved for common use is that of Rome, of which many editions have been published.

PROCESSIONS, as solemn and religious rites, are of very great antiquity. With the Greeks and Romans, they took place chiefly on the festivals of Diana, Bacchus, Ceres, and other deities; also before the beginning of the games in the Circus; and in spring, when the fields were sprinkled with holy water to increase their fertility. The priests used to head them, carrying images of the gods and goddesses to be propitiated, and either started from certain temples or from the Capitol. Among the Jews, certain processions around the altar were (and still are to a certain extent) usual on the Feast of Tabernacles; and from them the Mohammedans have adopted their mode of encompassing the sanctuary seven times at Mecca (q. v.). Processions form a prominent part of the Buddhist worship. The practice was early adopted in the Christian Church. The Reformation abolished it; and even in the Roman Catholic Church, especially in mixed countries, processions are less frequent or popular now than in former years. They are there either supplicatory processions or cross processions, and are either directed to a certain distant place, to some miraculous image or object, or they are confined to the streets of the cities and the churches. Banners, crosses, and images are generally carried in front; the clergy follow; and the people make up the rear, singing hymns or reciting prayers. In some Protestant states, they are still permitted, under certain restrictions. There is no doubt that, whatever their general intrinsic value, they offer in many instances one of the most strikingly picturesque features of the Roman faith; and that they answer a certain instinctive want in the multitude. For extensive pilgrimages, as such, their history and rites, we refer to PILGRIM, MECCA, FESTIVALS, &c.

PROCHEIN AMI, the old Norman-French for next friend, still often used in English law, means the person in whose name an infant sues in a court of law, or a married woman in a court of equity. The chief object is to have a person responsible for costs. See NEXT FRIEND.

PRO'CIDA, an islet of Italy, between the island of Ischia and the shores of Naples, and separated from both of these by seaways about a mile in width, is three miles long and one mile broad. Pop. 13,810. On its shores is the city of the same name, with a commodious harbor, a fine regal palace, and a horrible state-prison, recently rendered famous by Carlo Poerio, who was confined there in chains.

PROCLAMA'TION, a public notice given by the sovereign to his subjects. The power of issuing proclamations is part of the prerogative of royalty as the fountain of justice. They sometimes consist of an authoritative announcement of some matter of state, or act of executive government affecting the duties of obligations of subjects. The demise of the crown, and accession of a new sovereign, a declaration of war, and the issue of new coin, are all occasions on which a royal proclamation is issued. A proclamation may also be issued to declare the intention of the crown to exercise some prerogative or enforce some law which has for a long time been dormant or suspended. In time of war, the crown by a proclamation may lay an embargo on shipping, and order the ports to be shut. But the most usual class of proclamations are admonitory notices for the prevention of offences, consisting of formal declarations of existing laws and penalties, and of the intention to enforce them; such as the proclamation against vice and immorality, appointed to be read at the opening of all courts of Quarter Sessions in England.

Proclamations are only binding when they do not contradict existing laws, or tend to establish new ones, but only enforce the execution of those which are already in being, in such manner as the sovereign judges necessary. A proclamation must be under

the Great Seal. Statute 31 Henry VIII. c. 8 declared that the king's proclamations should be as binding as acts of parliament; an enactment which, while it subsisted, made an entire revolution in the government; but was repealed by 1 Edw. VI. c. 12. In later times, it was attempted to be maintained by the crown lawyers that the king might suspend or dispense with an existing law by proclamation; a power, however, which act 1 Will. and Mary c. 2 declared not to exist.

PRO'CLUS, called the successor (*Diadochos*)—i. e., of Syrianus, as the head of the Athenian school—a celebrated Neo-Platonist, was born in Constantinople in 412. He was of Lycian origin, and received his first instruction at Xanthus, in Lycia. He then studied at Alexandria under Arion, Leonaras, Hero, and especially under Heliodorus, with whom he applied himself chiefly to Aristotelian and Platonic philosophy. From thence he went to Athens, where a certain Plutarch, a philosopher, and his daughter, Asclepiogeneia, became his instructors—the latter a priestess of Eleusis, chiefly in theurgic mysteries. The vivid imagination and enthusiastic temperament which in his childhood already had led him to believe in apparitions of Minerva and Apollo, naturally convinced him when all the influences of the Mysteries (q. v.) were brought to bear upon him, still more of his immediate and direct intercommunication with the gods; and he distinctly believed himself to be one of the few chosen links of the Hermetic chain through which divine revelation reaches mankind. His soul had, he thought, once lived in Nicomachus the Pythagorean, and, like him, he had the power to command the elements to a certain extent, to produce rain, to temper the sun's heat, &c.

The Orphic Poems (q. v.), the writings of Hermes, and all that strangely mystical literature with which the age abounded, were to him the only source of true philosophy, and he considered them all more or less in the light of divine revelations. That same cosmopolitan spirit in religious matters which pervaded Rome towards her end, had spread throughout all the civilized 'pagan' world of those days, and P. distinctly laid it down as an axiom, that a true philosopher must also be a hierophant of the whole world. Acquainted with all the creeds and rites of the ancient Pantheons of the different nations, he not only philosophized upon them in an allegorizing and symbolizing spirit, as many of his contemporaries did, but practised all the ceremonies, however hard and painful. More especially was the practice of fasting in honor of Egyptian deities, while on the one hand, it fitted him more and more for his hallucinations and dreams of divine intercourse, on the other hand more than once endangered his life. Of an impulsive piety, and eager to win disciples from Christianity itself, he made himself obnoxious to the Christian authorities at Athens, who, in accordance with the spirit of religious intolerance and fanaticism which then began to animate the new and successful religion against which P. waged constant war, banished him from the city. Allowed to return, he acted with somewhat more prudence and circumspection, and only allowed his most approved disciples to take part in the nightly assemblies in which he propounded his doctrines. He died in 485, in his full vigor, and in the entire possession of all his mental powers, for which he was no less remarkable than for his personal beauty and strength.

Respecting his system, some modern philosophers have exalted it to an extent which his own works would hardly seem to warrant. Victor Cousin holds that he has concentrated in it all the philosophical rays which emanated from the heads of the greatest thinkers of Greece, such as Pythagoras, Plato, Aristotle, &c. P. recognizes a certain kind of unity of the Creator, or rather of the divine mind, of which he took the human to be a fragment; and he speaks of the 'One' and 'The First.' The human soul he considered wrapped up in various more or less dense veils, according to the degree of perfection attained; and he further assumed a certain sort of solidarity between the souls of those who naturally, or by certain immutable circumstances, were linked together, such as children and parents, rulers and subjects; and he carried this doctrine so far as to assert, that the children must naturally participate in their parents' faults. Faith alone, he further held, was essential to the attainment of Theurgy, which, comprising magic and supernatural inspiration, is preferable to all human wisdom; and in this he chiefly differs from Plotinus (q. v.), with whose system he agrees in most other respects. He further tries to recognize and to fathom the original mysterious One by combination of figures, strongly reminding us of Gnosticism and the later Kabbala. His way of developing the finite beings out of the infinite Unit is also peculiar. A whole series of triads, at the head of each of which again stands a unit, goes in various gradations through the creation, the lower powers emanating from the higher, which are the thinking and creative ideas, &c. See PLOTINUS, GNOSTICS.

Of his manifold works, there have survived several hymns, which, by the true poetical and religious spirit which pervades

them, stand out most favorably among the generally inane Orphic hymns. Of his astronomical and mathematical writings, there have survived a short summary of the chief theories of Hipparchus, Aristarchus, Claudius Ptolemæus, and others, a work *On the Heavenly Spheres*, a Commentary on Euclid, and a work—only known in a Latin translation—*On the Effects of the Eclipses of the Sun and Moon*. His grammatical works consist of some commentaries on Homer, Hesiod, &c. The greater part of his writings is devoted to philosophy. These are partly commentaries and paraphrases of Platonic dialogue, and partly the embodiments of his own ideas in a systematic form. We thus have a work—again preserved in Latin only—*On Providence and Fate*, *On the Ten Doubts about Providence*, &c., *On Platonic Theology*, and other minor works, extant in a more or less fragmentary form, and repeatedly edited, with translations and modern commentaries. The most important of his works, however, is the *Philosophical and Theological Institution*, in which P. geometrically, as it were, evolves his doctrines by heading each of its 211 chapters by a kind of proposition, which he proceeds to demonstrate, appending corollaries in some instances. He chiefly treats in it of unity and multiplicity, on productive causes and effects, on the highest good, on that which suffices in itself, on immobility, perfection, eternity, divinity, and intelligence; on the soul, &c. Next in importance stand his commentaries on Plato's *Timæus*, which, however, now only embraces a third of this dialogue, a similar commentary on Plato's *Parmenides*, in seven books, on *Cratylus*, the *First Alcibiades*, and fragments on other Platonic writings. Some other works attributed to P. have by modern investigators been pronounced to be spurious.

PROCONSUL, a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul, not, however, extending over the city and its vicinity. The proconsul was, at first, one who had held the office of consul, whose *imperium* was prolonged to enable him to bring an unfinished campaign to a close. The duration of the office was a year. During the latter period of the republic, when the consuls were expected to spend the year of their consulate at Rome, they were generally appointed at its close to undertake, as proconsuls, either the conduct of a war in some province, or its peaceful administration. Occasionally, the office of proconsul, with the government of a province, was conferred on a person who had never held the consulship. Under Constantine, parts of certain dioceses came to be governed by proconsuls.

PROCOPE, ANDREW, the Hussite leader, known as P. the Elder, or the Holy, or the Shaven, in allusion to his having received the tonsure in early life, was born towards the close of the 14th c., and belonged to a noble family of Prague. After having traveled with an uncle for some years through France and Spain, he returned to Bohemia at the outbreak of the religious wars, in which Ziska (q. v.) took so prominent a part, and at once entered the ranks of the insurgent Hussites. His military genius soon raised him to the rank of an influential commander; and on the death of Ziska in 1424, P. was elected by the Taborites, who formed an important section of the Hussites, as their leader, and from this period to 1427, his history presents an almost unbroken series of daring attacks upon the Austrians. In the meantime, another body of Taborites, who called themselves Orphans, had overrun Lausitz, and burned Lauban, under the leadership of a man, subsequently known as Procop the Lesser, or Younger, who now, in concert with the more distinguished P., attacked Silesia, and took part in those internal feuds of the Hussite factions by which Bohemia was almost wholly ruined.

The threatened approach of three German armies, which had been levied by the neighboring states to carry on an exterminating crusade against the heretics, was alone able to restore unanimity to the divided Hussites, who, under the leadership of the two Procop, offered a desperate and successful resistance to the larger numbers of the Germans, subsequently pursuing their enemies with fire and sword through Silesia, Moravia, and Hungary, as far as Presburg. In 1429, P. made inroads into the German states as far as Magdeburg, and returned to Bohemia laden with spoil, and followed by a numerous band of captive nobles and knights; and in the following year, at the head of 50,000 men-at-arms, and half as many horsemen, he again broke into Misnia, Franconia, and Bavaria, and after having burned 100 castles and towns, and destroyed 1400 villages and hamlets, and carried off a vast amount of treasure, turned his arms against Moravia and Silesia. The Emperor Sigismund at this crisis offered to treat with him, but the imperial demand, that the Hussites should submit to the decision of a council, afforded P. a pretext for breaking off all negotiations with the imperial court. A second German crusading army now advanced in 1431, but was thoroughly defeated at Riesenburg. These successes, which were followed by others of nearly equal importance in Silesia, Hungary, and Saxony, where the princes had to purchase peace at the hands of the two Procop, on humiliating terms, induced the council of Basel to propose a meet-

ing between the Hussite leaders and ten learned Catholic doctors. The meeting lasted fifty days, but was productive of no good result, and P. returned to Bohemia, where, combining his forces with those of Procop the Lesser, he laid siege to Pilsen. The council on this, passed an act, known as the Basel Compact, by which the Hussites were allowed the use of the cup in the Lord's Supper, and the Bohemians were designated by the title of the 'First Sons of the Catholic Church.'

The Taborites and Orphans, under the leadership of the two Procop, refused, however, to have anything to do with the pope, and hence dissensions arose between them and the more moderate of the Hussites. After many lesser encounters between these factions, a decisive battle was fought near Lipau in 1434, in which P. was induced, by a feint of the enemy, to leave his intrenchment. His followers at first fought desperately against the troops of the Bohemian nobles, who were commanded by Meinhard of Neuhaus; but at length, under the influence of a sudden panic, they gave way, and took to flight. P., after vainly striving to re-form their broken lines, threw himself into the midst of the enemy, and was killed. Procop the Lesser, following in his steps, was also slain, and with these two brave Hussite leaders the cause of the Taborites perished.

PROCOPIUS, an eminent Byzantine historian, was born at Cæsarea, in Palestine, about the beginning of the 6th c., went to Constantinople when still a young man, and acquired there so high a reputation as a professor of rhetoric, that Belisarius, in 527, appointed him his private secretary. P. accompanied the great warrior in all his important campaigns in Asia, Africa, and Italy, and appears to have displayed remarkable practical as well as literary talent, for we find him placed at the head both of the commissariat department and of the Byzantine navy. He returned to Constantinople shortly before 542, was highly honored by Justinian, and appointed prefect of the metropolis in 562. His death occurred, it is thought, about three years later. P.'s principal works are his *Historia*, in 8 books (two on the Persian war, from 498 to 553; two on the war with the Vandals, from 395 to 545; four on the Gothic war, going down to 553); *Ktismata*, or six books on the buildings executed or restored by Justinian; and *Anekdotai*, or *Historia Arcana* (of doubtful genuineness), a sort of *chronique scandaleuse* of the court of Justinian, in which the emperor, his wife Theodora, Belisarius, his wife Antonina, and other distinguished persons, are depicted in the darkest colors.

The most valuable of these productions is undoubtedly the first, in which P. writes with the clearness, weight, and fulness of knowledge that might be expected of a man who had been an eye-witness of much of what he narrates, and who had occupied a position that fitted him to thoroughly understand what he had seen. He is the principal authority for the reign of Justinian. His style is pure, vigorous, and flexible. The best edition of his complete works is that by Dindorf (3 vols., Bonn, 1833—1838).

PROCRUSTES (Gr. 'the Stretcher'), the surname of a celebrated robber of Attica, named Damastes, or Polypemon. According to the ancient legend, he was wont to place all persons who fell into his hands upon a bed which was made either too long or too short for them, and where he racked their limbs till they died. This he continued to do until Theseus overpowered him, and made him suffer the tortures he had inflicted on others. The story has given rise to a figurative expression. When an author is subjected by a critic to a cruel or unfair mode of criticism, he is said to be stretched on 'the bed of Procrustes.'

PROCTER, BRYAN WALLER, an English poet, better known as **BARRY CORNWALL**, was born 21st Nov. 1787, and educated at Harrow. He studied law, was called to the bar in 1831, and for many years was one of the Commissioners of Lunacy, but resigned in 1860. His *Dramatic Scenes and other Poems*, were published in 1819, and he subsequently produced several volumes, both of verse and prose, the most important being *Mirandola, a Tragedy*, produced with great success at Covent Garden. As a poet, P. belongs to the school of Keats and Hunt, and through all his works, the influence of the old English dramatists may be traced. It is not, however, on his *Dramatic Scenes* or his tragedies, but on his *English Songs and Lyrics*, that P.'s reputation rests. He may fairly be considered the best of our modern English song-writers. He died Oct. 4, 1874. *Bryan Waller P., an Autobiographical Fragment, with Biographical Notes*, appeared in 1877.—His daughter, **ADELAIDE ANNE P.**, well known as a poetess, was born in 1825, and died in February 1864.

PROCTOR (formed by contraction from Lat. *procurator*, one who cares for another) is the name given to the practitioners in Courts of Admiralty, and in the Ecclesiastical and Prerogative Courts. It corresponds to attorney or solicitor in the other courts. By a recent statute, which abolished the exclusive jurisdiction of the Admiralty and Prerogative Courts, now the Probate Court, all proctors were put on the same footing as attorneys and solicitors, and the power to practise in the new courts indifferently was given to each; and at the same time compensation was given for

the loss of their monopoly. The mode by which one becomes a proctor is therefore the same as that by which one becomes an Attorney or Solicitor (q. v.).

PROCTORS, officers in the universities of Oxford and Cambridge (two in number in each), whose duties are to preserve the peace of the university, to repress disorders among the students, and inflict summary academical punishment. They have the command of the academical constabulary force, and have also an extensive police jurisdiction in the town. The proctors must be Masters of Arts, and are chosen by the colleges according to a certain rotation. They nominate two pro-proctors to be their deputies and assistants. The summary authority of the proctors extends both to undergraduates and Bachelors of Arts. They have also a legislative authority as assistants to the heads of houses, and vote in the election of some of the professors and other officers.

PROCURATOR-FISCAL, a legal practitioner in Scotland of some consequence, owing to his being the public prosecutor for a local district. He is generally a local procurator, or law-agent, and is appointed by the sheriff of the county, or in cities and towns by the magistrates. His business is to take the initiative in the prosecution of crimes. There being no coroner's inquisition in Scotland, he does the work which that functionary does in England. Whenever he has reason to believe a crime has been committed, his duty is to apply for a warrant to arrest the alleged criminal, or to summon him before the sheriff, when the witnesses are cited, and are precognosed—that is, they give what evidence they are in possession of. All the inquests and examinations of the procurator-fiscal are conducted privately; neither the press nor the public being allowed to be present. This arrangement, as tending to huddle up that which should be fully known—as, for example, the cause of catastrophes attended with loss of life—has latterly been the subject of earnest remonstrance. If the procurator-fiscal is informed of a crime which he thinks was either not committed, or of which there is no evidence satisfactory, he gives his concurrence merely to the private party who suggests it, but does not himself initiate the proceeding. When the procurator-fiscal takes the precognitions of the witnesses, he sends a copy of them to the crown counsel, of whom the Lord Advocate is the chief; and if these counsel think the evidence is strong enough, and warrants more than suspicion, the prosecution is proceeded with to trial. The procurators-fiscal are now paid by salaries according to the population of the district.

PRODIGY. See OMEN.

PRODUCTION OF DOCUMENTS is often required in legal proceedings, or in the course of a suit, in Scotland, as well as in other countries; but it depends on the nature of the suit when and under what conditions the documents must be produced. As a general rule, whenever a right is founded on a document, that document must be produced or shewn to the court which has to determine the nature of the right.

PRODUCTIVE, and UNPRODUCTIVE, LABOR. See LABOR.

PROFESSOR, an officer in a university whose duty it is to instruct students, or read lectures on particular branches of learning. In the early times of universities, the degrees conferred on students were licenses to act as public teachers; and the terms Master, Doctor, and Professor were nearly identical in significance. As, however, the body of graduates ceased in the course of time to have any concern in public teaching, a separate class of recognized teachers sprang up, paid sometimes with salaries, in other instances by fees. These were called professors; and in the German and Scottish universities became the governing body, and sole recognized functionaries for the purpose of education. In the universities in which collegiate foundations prevailed, as Oxford and Cambridge, they became, on the other hand, only secondaries or auxiliaries, attendance on their lectures not being generally deemed indispensable, and the necessary business of instruction being carried on by the functionaries of the several colleges.

The word professor is occasionally used in a loose way to denote generally the teacher of any science or branch of learning, without any reference to a university. It has been assumed as a designation not only by instructors in music and dancing, but by conjurers.

PROFILE, the outline of a section through a cornice or other series of mouldings.—The outline of a capital when drawn geometrically; the outline of the human face in a section through the median line; &c.

PROGNOSIS (from the corresponding Greek word) is the term employed in medicine to indicate the opinion or decision of the physician regarding the probable course and issue of a disease. The physician is guided in arriving at his decision by his knowledge of the course which the disease usually follows; and as some diseases almost always end in recovery, and others almost invariably

ably terminate fatally, the final result may often be predicted with great confidence. In forming a prognosis, the physician must, however, not only take into his consideration the natural history of the individual disease, but numerous modifying influences, such as age, sex, mode of life, previous state of health, &c.

PROGRESS OF TITLES, in Scotch Law, means the series or chain of conveyances by which a proprietor of lands establishes his right to property. As these titles are the sole evidences of property, the progress of titles—i. e., a short statement of the nature of each conveyance, in their historical order—is first given to a purchaser, to show that the vendor is able to sell. See SALE OF LAND.

PROGRESSION, in Arithmetic, is the succession, according to some fixed law, of one number after another. A series of numbers so succeeding one another is said to be 'in progression.' Progression may be of various kinds, but the three forms of most frequent occurrence are *Arithmetical Progression* (q. v.), *Geometrical Progression* (q. v.), and *Harmonical Progression*. The conditions of the harmonical progression of a series are frequently stated as follow: *three numbers are in harmonical progression, when the first has to the third the same ratio that the excess of the first over the second has to the excess of the second over the third*, i. e., a, b, c are in harmonical progression when $a : c :: a - b : b - c$; but a much simpler conception of it is obtained by means of one of its properties, viz., that if the terms of a harmonical series be inverted, they form a series in arithmetical progression; thus, 1, 2, 3, 4, 5, 6, &c. is an arithmetical progression; and 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, &c. is a harmonical progression; 1, $\frac{1}{2}$, 0, $-\frac{1}{2}$, -1, &c. is an arithmetical progression; and 1, 2, ∞ (infinity), -2, -1, &c. is a harmonical progression. This series is principally important in connection with the theory of music, in determining the length of the strings of instruments. See MUSIC.

PROGRESSION, MUSICAL, the regular succession of chords or movements of the parts of a musical composition in harmony, where the key continues unchanged, is called Progression; where a new key is introduced, it is not progression, but Modulation (q. v.). Musical compositions move from note to note either by degrees, when the interval does not exceed, or by skips where it does exceed a whole tone. Motion in music of two parts is of three kinds: oblique, when one part repeats or holds on the same note, while the other moves up or down; direct, when both parts move in the same direction; and contrary, when one moves up, and the other down. In progressing from chord to chord, it is in general desirable to retain every note common to both chords in the same part in which it appeared in the first chord, and to assign every new note to that part in the second chord which is nearest to it. There are certain chords which require to be followed by certain others in order to resolve them (see RESOLUTION); and there are certain progressions which must in ordinary cases be avoided, more particularly consecutive fifths and consecutive octaves, the latter being, however, admissible when employed to strengthen a part.

PROHIBITION. Prohibitive duty refers to a practice, obsolete in this country, of prohibiting the importation of goods, with the view of encouraging native industry. See FREE TRADE.

PROHIBITION is a writ in England proceeding out of a superior court of law to prohibit or prevent an inferior court from proceeding to hear or dispose of a suit or matter over which it has no jurisdiction.—In Scotch law, the same word means a technical clause in a deed of entail by which the heir of entail is prohibited from selling the estate, or contracting debt, or altering the order of succession under pain of forfeiture, which forfeiture is declared by another supplemental clause called a resolutive clause.

PROJECTILES, THEORY OF, is the investigation of the path or trajectory, as it is called, of a body which is projected into space in a direction inclined to that of gravitation. A body thus projected is acted upon by two forces, the force of projection, which, if acting alone, would carry the body onwards forever in

Fig. 1.

the same direction and at the same rate; and the force of gravity, which tends to draw the body downwards towards the earth. The force of projection acts only at the commencement of the body's motion; the force of gravity, on the contrary, continues to act effectively during the whole time of the body's motion,

drawing it further and further from its original direction, and causing it to describe a curved path, which, if the body moved in a vacuum, would be accurately a parabola. This is readily seen by considering fig. 1, in which A represents the point from which the body is projected (suppose the embrasure of a fort); AB the direction of projection (horizontal in this instance); A1 the distance which would be passed over by the projectile in unit of time if gravity did not act; 1—2, the distance which would similarly be described in second unit of time; 2—3, 3—4, &c. the distances corresponding to the third, fourth, &c. units of time—all these distances being necessarily equal, from the impulsive nature of the force of projection; A1', again, represents the distance which the projectile would fall under the action of gravity alone in the first unit of time; 1'—2' the distance due to gravity in the second unit of time; 2'—3' the distance due to the third unit, &c., the distances A1', A2', A3', &c., being in the proportion of 1, 4, 9, &c. (see FALLING BODIES); hence, by the well-known principle of the *Composition of Forces and Velocities* (q. v.), we find at once, by completing the series of parallelograms, that at the end of the first unit of time the body is at *c*, at the end of the second at *b*, at the end of the third at *e*, &c. Now as the lines 1*c*, 2*b*, 3*e*, &c. increase as the numbers 1, 2, 3, &c., and the lines A1', A2', A3', &c. as the numbers 1², 2², 3², it follows that the curve *Acbe* is a Parabola (q. v.).

As, by the second law of motion, each force produces its full effect undisturbed by the other, it follows that the projectile reaches *f* in the same time as it would, without being projected, have taken to fall to *f*'. A greater velocity of projection would make it take a wider flight; but at the end of four seconds, it must still be at some point in the same horizontal line—at *g*, for example.

In order to determine exactly the motion of a projectile, and to find its range, greatest altitude, and time of flight, it will be necessary to examine its nature more technically—for which some slight knowledge of algebra and trigonometry is requisite. Let the body in this instance be projected obliquely to the direction of gravity, from the point A (fig. 2) in the direction AT, and let the velocity

Fig. 2.

of projection v be sufficient, if gravity were not to act, to carry it to T in t units of time, and let the force of gravity, if allowed to act upon it at rest, carry it to G in the same time; then, as before, the body, under the action of both forces, will be found at P (which is found by completing a parallelogram of which AT and AG are the sides) at the end of t units of time, having fallen through a distance equal to TP (not at once, but in a constant succession of minute deflections, as indicated in fig. 1) in that time. Let t represent the time of flight, v the velocity due to projection, g the accelerating force of gravity, and let A be the angle of elevation TAB; then $AT = vt$, $TP = \frac{1}{2}gt^2$, $TM = vt \sin. A$; and consequently PM (or y) = $vt \sin. A - \frac{1}{2}gt^2$ (I.), and AM (or x) = $vt \cos. A$.

Now, if we find from the last two equations the values of t , and equate these values, we obtain, by an easy algebraic process,

the equation $y = x \tan. A - \frac{gx^2}{2v^2 \cos.^2 A}$; and if the height

through which the body must fall to acquire a velocity equal to the velocity of projection be called h , then $v^2 = 2g \cdot h$, $h = \frac{v^2}{2g}$,

$4h = \frac{2v^2}{g}$, and $\frac{1}{4h} = \frac{g}{2v^2}$, substituting which in the equation, we

obtain $y = x \tan. A - \frac{x^2}{4h \cdot \cos.^2 A}$ (II), as the equation to the

path of a projectile, where x is the horizontal distance, and y the corresponding height above the level of the point of projection.

Suppose, now, that we wish to find the *time of flight* on the horizontal plane, it is evident that at the end of its flight the projectile will be at B, and y will be equal to zero; hence, putting

$y = 0$ in equation I., we obtain $t = \frac{2v \sin. A}{g}$. The range or dis-

tance AB is similarly found by putting $y = 0$ in equation II., when x is found to be equal to $4h \sin. A \cos. A$, or $2h \sin. 2A$. The *greatest altitude* is evidently the point which the projectile has attained at the end of half the time of flight, or after it has traversed half its horizontal range, hence, by putting $x = 2h \sin.$

$A \cos. A$ in equation II., or $t = \frac{v \sin. A}{g}$ in equation I., we ob-

tain $y = h \sin.^2 A$. A slight examination of the expression for the range will show that it is greatest when the body is projected upwards at an angle of 45° to the horizon, and that a body projected at a greater angle than 45° has the same range as one projected at an angle correspondingly less (fig. 3).

Fig. 3.

These results, however, do not correspond to the actual circumstances of the case, except when the projectile possesses considerable density and its motion is slow, for in all other cases, the resistance of the air, which increases in a rapid ratio with the velocity of the projectile, causes it to deviate very considerably from a parabolic orbit, especially during the latter half of its course (fig. 4). The problem of the motion of a projectile thus

Fig. 4.

complicated becomes of considerable difficulty; partly because our knowledge of the law of resistance of the air is imperfect (it was supposed by Newton to be proportioned to the square of the velocity), and partly because the law varies with every minute change in the form, size, and density of the body projected, so that, under these circumstances, the beautiful and simple theory sketched above is practically useless. The chief illustrations of the theory of projectiles are the motion of missiles thrown by the hand, or arrows impelled from a bow, in both of which cases the resistance of the air is comparatively ineffective, the velocity being small: in the far more important case of ball-practice, whether with fire-arms or heavy ordnance, its effects are so powerful as to render the laws of gunnery mere deductions from experience. See RIFLE AND RIFLED ORDNANCE, and GUNNERY.

PROJECTION is the representation on any surface of objects or figures as they appear to the eye of an observer. It thus includes Perspective (q. v.), and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection, and the place of the light the position of the eye. The theory of projections is of great importance, both in mathematics and geography, being, in the former case, perfectly general in its application; while in the latter only the projection of the sphere is required.

Projections of the sphere are of various kinds, depending upon the position and distance of the eye from the sphere, and the form of the surface on which the projection is thrown; thus, we have the *orthographic*, *stereographic*, *globular*, *conical*, and *cylindrical* or *Mercator's* projections, all of which are treated of under the article MAP. Another projection frequently employed is the *gnomonic*. In the gnomonic projection, the eye is supposed to be situated at the center of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the *principal point*). It is evident that a map constructed on the gnomonic projection is sensibly correct only for a circular area whose circumference is at a small angular distance

from the principal point. From the position of the eye in the gnomonic projection, it follows that all great circles, or portions of great circles, of the sphere are represented by straight lines, for their planes pass through the eye. The distance of two points on the sphere, when measured along the surface, is least if they are measured along a great circle; and as the distance of the projections of these points on the plane is represented by a straight line, which is the shortest distance between two points on a plane, this projection, if employed in the construction of mariners' charts, would at once show the shortest course. Maps of the earth's surface have been projected by the gnomonic method, the surface of projection being the interior surface of a cube circumscribing the sphere, and the complete series consequently amounting to six maps; but it is not fitted for the construction of maps of large portions of the earth's surface. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or Dial (q. v.). The orthographic, and stereographic projections were employed by the Greek astronomers for the construction of maps of the heavens; the former, or *analemma*, being the best known and most used. The stereographic, called *planisphere* by the Greeks, is said to have been invented by Hipparchus, and the gnomonic is described by Ptolemy. The others are of modern invention.

In Mathematics, the theory of projections is general in its application, and has been employed within the last few years to generalize the ancient geometry, and as a powerful aid to algebra. Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the 'magnitude,' but on the 'position' of the lines and angles belonging to the figure. These properties are generally denominated *projective properties*. For instance, the three conic sections, the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all 'positional' properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The theory is also largely employed in demonstrative mechanics.—See, for further information, Mulcahy's *Modern Geometry*, Salmon's *Conic Sections*, Monge's *Géométrie Descriptive*, Poncelet's *Propriétés des Figures Projectives*, and Poisson's *Traité de Mécanique*.

PROLA'PSUS A'NI is a common affection of the termination of the intestinal canal, and consists in an eversion of the lower portion of the rectum, and its protrusion through the anus. It may depend on a naturally relaxed condition of the parts, as in infancy, or may be caused by violent straining, in cases of costiveness, piles, &c. Whenever it occurs, the parts should be washed, and, if possible, replaced by careful pressure with the hand; and if they do not easily return, the forefinger should be oiled, and pushed up into the anus, and it will convey the protruded intestine with it, after which the patient should retain the recumbent position for some hours. If it cannot be returned by the above means, surgical assistance should be at once sought. In order to remove the tendency to prolapsus, the patient should regulate his bowels so as to avoid costiveness, should sponge the parts after every evacuation with cold water or soap and water, and if necessary, use astringent injections, as, for example, a weak solution of sulphate of iron, one grain to the ounce. Dr. Druitt (in his *Surgeon's Vade Mecum*) recommends a plan first suggested by Dr. McCormac—namely, that when the stools are passed, the skin near the anus should be drawn to one side with the hand, so as to tighten the orifice. If, after the adoption of these means, the bowel continues to descend, certain surgical means must be resorted to, as destroying a small portion of the relaxed mucous membrane by the application of nitric acid, or pinching up a few folds of the protruded membrane with the forceps, and applying ligatures to them.

PROLA'PSUS U'TERI—known also as PROCIDENTIA or DESCENSUS UTERI, by writers on the diseases of women; and as 'falling down of the womb,' or 'bearing down,' among non-professional persons—consists essentially in a depression of the womb below the natural level in the pelvis. It is a common affection amongst all ranks, and is most frequent in women beyond the middle age who have borne large families. It has, however, been met with in women who have not borne children, in virgins, and even (although very rarely) in children. It may occur in every degree, from the case in which the mouth of the womb is a little lower than its natural level, to that in which the womb itself projects externally, and forms a protruding tumor as large as a melon. In the latter case, it displaces by its traction the bladder, rectum, and other important structures. The prolapse is termed *imperfect* as long as there is no external protrusion, and *perfect* when the womb is protruded externally. The causes of these different degrees of prolapse are the same, and the symptoms differ only in intensity. The immediate causes are, according to Sir C. Clarke: (1.) Relaxation of the ligaments of the uterus; (2.), a want of due tone in the canal leading from the uterus to the ex-

ternal surface. The latter is probably the chief cause. After many child-bearings, it remains dilated, and its walls lose their resisting power. Similar effects result from repeated uterine hæmorrhage, leucorrhœa, (popularly known as the *Whites*), and general debility. Under these conditions, a very slight downward force will depress the womb; and this force is supplied by the increased weight of the organ itself, if the patient sit up or walk soon after delivery, by violent vomiting or straining (when the bowels are constipated), by the endeavor to lift heavy weights, &c.

The symptoms arise partly from the pressure of the womb on other organs, partly from the simultaneous displacement of adjacent parts (as the bladder, rectum, &c.), and partly from reflex action (see NERVOUS SYSTEM). Patients with only a slight displacement usually complain of a sensation of fullness in the pelvis, of weight and bearing down, of dragging from the loins, often amounting to pain in the back, these symptoms being aggravated when the upright position is assumed. Strangury (q. v.) is occasionally present, and if the womb descend low or protrude, there is always more or less difficulty in evacuating the contents of the bladder and rectum. The digestive organs soon become affected through reflected nervous influence. It is a remarkable fact, that the general health is often much worse in those cases in which there is a slight depression, than in those in which the prolapse is complete, and the womb forms an external tumor.

The treatment varies with the degree of displacement. In the milder cases, medicine should be administered with the view of giving tone to the mucous membrane of the relaxed canal; while in the severe cases, mechanical support is requisite. In comparatively mild cases, prolonged rest in the horizontal position should be enforced, and cold water (from half a pint to a pint) should be slowly injected, night and morning, into the canal leading to the uterus, by means of an elastic bottle, the patient being in the recumbent position as she receives the injection. If this treatment is insufficient, astringent injections, as decoction of oak-bark or of galls, or a solution of alum (an ounce to the pint of water), should be tried. If, however, there is any congestion or inflammation of the parts, astringents must be avoided. In a case of complete prolapse, the first duty of the practitioner is to attempt to restore the womb to its natural position. It is sometimes necessary to place the patient in a warm bath, or to apply fomentations or leeches to the tumor before it can be replaced; and occasionally, irreducible cases occur, in which it may be necessary to remove the organ altogether. But suppose it returned to its position, a repetition of the prolapse has to be prevented. The ordinary method is by the introduction of a pessary—an instrument of an oval or globular form, and usually made of box-wood, which mechanically supports the uterus in its normal position. See the works of Churchill, West, and others *On the Diseases of Women*. In some cases, a compress and bandage will afford sufficient support; while in other cases a surgical operation similar to that which is performed for *Prolapsus Ani* (q. v.) is expedient.

PROLÉTAIRES, a term used by the French (from whom it has been partially adopted by recent English and German writers) to denote the lowest and poorest classes of the community. It is derived from the Latin *proletarii*, the name given in the census of Servius Tullius to the lowest of the centuries, who were so called to indicate that they were valuable to the state only as rearers of offspring (*proles*).

PROME'THEUS (Forethought), the son of the Titan Iapetus and of Clymene, brother of Atlas, Menœtus, and Epimetheus (Afterthought)—or, according to other legends, the son of Iapetus and Asia, or of Uranus and Clymene, or of Euryneon and Here—the father of Deucalion, Hellen, Lykus, and Chymærus. The myth of P. is one of the oldest of Greek antiquity, being mentioned by Hesiod, and is briefly as follows:—Once, under the reign of Zeus, men and gods were disputing with one another at Mecone; P., with a view to outwit Zeus, cut up a bull, and divided it into two parts, hiding the meat and the intestines in the skin, and putting a bad piece (the stomach) at the top of it; while he laid in another heap the bones, which were covered with fat. Zeus pointed out the unequal division, but was asked to choose, whereupon he guessed the deceit practised, and selected the good portion; but irate at the stratagem, he avenged himself on the mortals by withholding from them the fire necessary for the cooking of the meat; whereupon P. stole it in a hollow staff, and brought it to them. Zeus, to punish the mortals, caused Hephestus to mould a virgin of rapturous beauty, Pandora, whom Epimetheus was unwise enough to receive as a present from Hermes; and thus brought, through her box, all imaginable ills that flesh is heir to upon humanity. P. himself was chained to a rock, and an eagle sent to consume his liver in daytime, while Zeus caused it to grow again at night. Herakles, however, killed the eagle, and, by the permission of Zeus, delivered the suffering Prometheus. Thus far Hesiod's legend.

Æschylus, in his tragedy with the name of the hero, has per-

petuated another view of the myth. P., according to him, is an immortal god, a friend of the human race, who does not shrink even from sacrificing himself for their salvation. He is the long-suffering hero, who, although overcome by Zeus's superior might, yet does not bend his mind. He at first assists Zeus against his own kindred, the Titans, and even opens his head at the birth of Minerva. But when Zeus, having come to the throne, conceived evil plans against mankind, wishing to destroy them entirely, in order to create a new race, P. throws himself into the breach; and while taking from them the evil gift of foreseeing the future, gives them the two infinitely superior gifts of hope and of fire. He is the inventor of architecture, astronomy, writing, figures, medicine, navigation, the mystery of prophecy, the arts of working in metal, and all other arts which embellish and adorn life. For these boons conferred on the human race, he is, by Zeus's order, chained to a rock in Scythia by Hephæstus, who fulfils this task reluctantly. Here he is visited by the Oceanides, by Io, who tells him of her own miserable wanderings, and by Hermes, who endeavors to find out that which P. only knows, viz., who will be the son of Zeus and his successor. Refusing to divulge this secret, he is struck by Zeus's lightning, and hurled into Tartarus, whence he only re-issues after a time to undergo new sufferings. He is now fastened to Mount Caucasus, and the eagle, an offspring of Earth and Tartarus, comes to torment him daily.

Cheiron, the Centaur, at last offers himself to supply P.'s place in Hades—for on no other condition was he to be liberated than that some other immortal should offer himself in his stead. Cheiron, incurably wounded by Herakles, is accepted by Zeus.—Other legends give varying accounts. One makes P. the creator of man out of earth and water.—Zeus having, after the flood of Deucalion, ordered both him and Here to make man out of the mud left, and the winds to breathe life into them; and at Panopeus, in Phocis, a piece of that creative earth was in after times shown to the wonder-struck multitude. It was also at his suggestion that Deucalion and Pyrrha built the vessel that bore them safely through the floods. P. had a sanctuary at Athens, and torch-races took place in his honor. Many have been the explanations of this myth, one of which is, that it represents the human mind, which, in the consciousness of its own power, refuses to obey implicitly the will of Zeus; another, that it embodies the first struggles between the ancient (Pelagian) powers of nature and the awaking of the mind, as represented by Zeus and the Olympians, &c. The subject is fully discussed in works on Prometheus by Welcker (1824), Weiske, Schömann, and Lasaulx (1845).

PROMISE, in English Law, is often used to denote one side of a contract or agreement, either by word of mouth or in writing which is not under seal. In England, an action cannot be brought on a promise unless some consideration was given for it; but in Scotland, a consideration is not necessary, provided the promise was made in earnest and with deliberation. A promise of marriage means a mutual promise, each being an equivalent for the other; and accordingly, if one breaks the promise, the other can sue for breach of it. See **MARRIAGE**.

PROMISSORY-NOTE is a contract by which A. the promiser, agrees to pay B. the promisee, a sum of money, either on request or on a future day. A is called the maker of the note, and B the payee of the note. The law affecting notes is substantially the same in all respects, and is always treated as part of that of Bills of Exchange (q. v.).

PROMOTION, a term which has been applied to the granting of a degree by a university. The practice of conferring the title of doctor by authority and after examination, seems to have originated in the university of Bologna, in the middle of the 12th century. Degrees were at first conferred by *cooptation*, i. e., admission by the common consent of the body of doctors; but in the beginning of the 13th c., Honorius III. placed promotions under the control of the archdeacon of Bologna.

PROMOTION, in the **ARMY AND NAVY**. The efficiency of any body of men depends upon the energy of the individuals composing it: the root of that energy is emulation; and emulation can only be secured by maintaining a proper current of promotion. The efficiency of a service is thus dependent on the system of promotion adopted; and so important, consequently, does promotion become, that in the present article it is purposed to glance at the rules observed in the principal armies of the continent, before describing the system which obtains in the British service.

In the *Army of France*, it is a common saying; that every conscript has a marshal's bâton in his knapsack. Speaking of the times of the revolutionary war, this was doubtless true, for battalions chose their chief officers from their own ranks—a conscript of one year was often a lieutenant-colonel the next, and perhaps a brigadier-general the following. In the quieter times of recent years, however, progress is slower; and although promotion is open to all, and a considerable proportion of the officers do rise from the ranks, yet it is very rarely indeed that an officer, who has so risen, ever attains a higher grade than that of cap-

tain. Junior commissions are—if the rule of the service were strictly followed—given, one-third to men from the ranks, one-third to cadets from the military schools, and one-third by government patronage. In practice, it appears that in the Artillery and Engineers, two-thirds of the first commissions are given to pupils from the Polytechnique, and the remainder to men from the ranks; while in the Line, two-thirds of the officers rise from the ranks, and one-third come from the Military school of St. Cyr. Before officers can be promoted, certain service in each rank is required, viz., as 2d lieutenant, two years; as lieutenant, two years; as captain, four years; as major, three years; and as lieutenant-colonel, two years. These periods are, however, curtailed in time of war. Promotion takes place in the regiment up to the rank of captain, two-thirds by seniority, and one-third by selection. From captain to major (*chef d'escadron ou de bataillon*), promotion is divided equally between seniority and selection; while to all higher ranks it falls exclusively to selection. The selection is made on reports by the inspectors-general of the several arms—their reports being founded on personal observation, and the testimony of senior regimental officers.

To maintain rapidity of promotion there is a fixed age at which officers *must* retire—viz., lieutenant-general, 65; major-general, 62; colonel, 60; lieutenant-colonel, 58; major, 56; captain, 53; and lieutenant, 52. These ages do not prevent the officers of a regiment from being the opposite of youthful.

In *Austria*, all officers are at first cadets; but a large proportion of these cadets are nominated from men in the ranks by their comrades. Promotion goes by seniority, and in the regiment, with occasional selection from other regiments.

The organization and officering of the German army are both peculiar. Every German subject, of whatever rank, is bound to serve from the age of 20 to 25; but in practice, this service is reduced to a year in the case of professional men. Every officer must serve in the ranks; but not necessarily for more than a day. Young gentlemen intended for officers enter the ranks as *aspiranten*. They do duty as common soldiers for from six to nine months, and pass two examinations. Afterwards they remain nine months at a Division School, or twelve months at an Artillery and Engineer School. They then become eligible for appointment as officers when vacancies occur, which, however, they cannot obtain unless recommended by the officers of their respective regiments. Two-thirds of the first commissions are given to these aspiranten, and one-third to pupils from the cadet schools.

In the *Italian* army, one-third of the sub-lieutenants are promoted from the ranks. Of subsequent promotion, two-thirds go by seniority, and one-third by selection.

It is always urged against the *British* system of army promotion that it is too exclusive, and confines the commissions to the upper classes of society; and there is no doubt that promotion from the ranks is much rarer than in almost any other army. But, on the other hand, it is argued, the constituents of the force are very different. Soldiers in Britain are not conscripts, who necessarily comprise men of all classes and all degrees of education, but are taken as a rule, from an extremely low and very uneducated class of society. Again, Britain has a true middle class, which is wanting in almost every continental nation. Its army is not, therefore, necessarily aristocratic because it is not officered from the ranks. Lastly, the habits of the different classes of society differ so greatly, that unless the soldier be very superior to his comrades, promotion to a commission is a small boon.

With regard to the actual system of promotion which obtains: in the ranks, promotion from private up to company-sergeant takes place in the company, and is made by the regimental officers. The promotion of company-sergeants to be staff-sergeants is made throughout the regiment. All these promotions are by selection entirely. Of the commissioned officers, the quarter-masters and riding-masters are appointed almost exclusively from the ranks; but they have no further promotion to look forward to—sergeants and sergeants-major are occasionally gazetted to ensigns or lieutenancies. The junior combatant officers acquire their commissions either by a competitive examination open to the whole nation, or by previous service in the militia as officers, or in the ranks of the army as non-commissioned officers. The Artillery and Engineers are officered entirely by cadets from the Royal Military Academy, whose subsequent promotion is by seniority only. In the Cavalry, Guards, and Line, vacancies are, since the abolition of the purchase system in 1871 (see **PURCHASE SYSTEM**), filled by 'seniority tempered by selection,' the selection becoming more strict as the higher ranks are reached.

The promotion of officers, up to the rank of captain, is mainly regimental, and is, at the same time, by seniority; but seniority is in this case qualified by what has been called negative selection—that is, in other words, the exclusion of those officers who do not prove their fitness for promotion at the periodical inspections and examinations. Above the rank of captain, for *substantive* or *regimental* rank, seniority is little regarded, and selection is more absolute; but officers may hold at the same time *army*

or *brevet* rank, conferred for distinguished service, or for mere seniority, in the general list of the whole army. This *brevet* rank does not affect the position in a regiment, and adds but a small sum to the officers' pay; but it is of great importance, inasmuch as colonels rise by seniority alone to be general officers, and colonel is almost exclusively a *brevet* rank (the only exceptions being in the Artillery and Engineers, where colonel is regimental rank). Under these rules, it sometimes happens that an officer who has never held higher regimental rank than captain, may become successively, for good service, *brevet-major*, *brevet-lieutenant-colonel*, and *brevet-colonel*, until he succeeds, in his turn, to the rank of *major-general*. See also **STAFF**.

In the Navy, the promotion of sailors to be petty officers is made by the captain of the ship; petty officers are appointed to be warrant-officers by the admiral of the station, subject to Admiralty confirmation. The commissioned officers are appointed and promoted by patronage solely. When a ship is first commissioned, the captain is allowed to nominate one cadet, the Admiralty name the rest. Promotions are made by selection by the Admiralty, except death vacancies which occur abroad; these are filled up by the admiral commanding on the station from the officers of his fleet. Above the rank of captain, all promotions take place by absolute seniority. There is no purchase of commissions in the navy.

PRONA'OS, the area or space before the cell of a temple, through which it was entered.

PRONG-HORN, or **PRONG-HORNED ANTELOPE** (*Antelope furcifera* *Dicranocerus furcifer*, or *Antilocapra Americana*), a species of antelope inhabiting the great western prairies of North America. It is the *Cabrit* or *Cabree* of the Canadian voyageurs, is also called *Goat* by the fur-traders, and sometimes receives the name of *Spring buck*. It is common between the Saskatchewan and the Missouri, and also on the Columbia, and is found in plains and on low hills, where there is no wood, or only scattered clumps of trees; never in mountainous districts, nor in forests. Its size

Prong-horned Antelope (*Antelope furcifera*).

is nearly that of the roe; in its general form and gait it resembles the chamois. In summer, the hair of the P. is smooth and flexible, but as winter approaches it lengthens; each hair becomes thick, its interior becomes white and spongy, and it loses its flexibility, at last becoming brittle, so that its point is easily rubbed off; but this singular fur forms a very close and warm covering for the animal. The P. is generally seen in small herds, sometimes solitary. It is very curious about any strange object, and advantage is sometimes taken of this by Indian hunters, who crouch, run a few yards, and stop again; the prong-horns wheeling around them, coming nearer, and becoming still more curious, till they are within shot.

PRONOUNS, one of the classes of words or parts of speech, possessing a special interest both logical and philological. 'I am sick.' 'Thou knowest the truth.' 'John was here, but *he* went away again.' 'Peter struck the boy, *who* had done *him* no harm.' 'What do you want?' The words in italics in these sentences are called *Pronouns*, because they stand for (*Lat. pro*) nouns, or names of persons and things; and they are generally said to be used to prevent the too frequent repetitions of the nouns. Yet the pronoun and the noun are not exact equivalents for each other. No noun can be an exact substitute for *I*, *thou*, or *who*. Pronouns are symbols, names, or highly-generalized marks, applied to objects to signify, not any inherent attribute, but merely their *relations to the act of speaking*. They might therefore be called *relational names*. *I*, for instance, is a name applied to all subjects that can be conceived as speaking. In such a sentence as 'I am sick,' in which the state 'sick,' is affirmed about some

one, the exact force of *I* may be thus expressed: The person of whom 'sick' is affirmed is one with the person making the affirmation. Who the individual person is, the pronoun *I* gives no indication; it is implied that this is known from some other source. Those present learn it by hearing whence the sound comes; in a book, it is gathered from the context.

In like manner, *thou* is a generalized name for all persons spoken to. What it means or *connotes* is—with reference to the example above given—that the person affirmed to know the truth, and the person to whom the affirmation is addressed, are one and the same. What particular person it *denotes*, must be learned, as before, from circumstances. If the clause '*he* went away again,' stood by itself, what person is denoted by *he* would be still more vague than in the case of *I* and *thou*. *He* merely implies that a person, neither the speaker nor the spoken to, but one known in some way, is the subject of the assertion. Who it is, is determined, in the example, by *John*, with which *he* stands in close relation. *Who* designates some person already named, referring us back to that name (the *antecedent*) for determining the individual. What *connotes* that the subject is unknown.

Pronouns are usually divided into Personal and Relative.

1. **Personal Pronouns**.—The several objects concerned in a speech or sentence stand in one or other of the three relations of speaker (First Person), object spoken to (Second Person), object spoken about (Third Person). Pronouns expressive of these relations are called Personal Pronouns. They are (in the nominative case), 1st person, *I*, *we*; 2d, *thou*, *ye* or *you*; 3d, *he*, *she*, *it*, *they*.

Along with the personal pronouns, and most nearly related to the pronouns of the third person, may be classed the words *one* and *that* in certain constructions. In phrases like '*One* cannot be sure of that,' *one* is an indefinite pronoun, designating any person whatever. It is distinct from the numeral adjective *one*, being derived from the French *on*, which is a corruption of *homme*, man. When we say, 'I like peaches, but let me have a ripe *one*, or ripe *ones*,' we have now the numeral used as another indefinite pronoun. The first of these indefinite pronouns is applied only to persons; the second, both to persons and things.

When we say, 'Give me *this*, and keep *that*,' *this* and *that* may be considered as demonstrative adjectives, with some noun understood—*this* (thing). But in the expression, 'He mistook his own room for *that* of the stranger,' *that* appears to be as much a pronoun as *one*.

2. **Relative Pronouns** (including *Interrogative*).—Relative Pronouns, besides standing for nouns, have the power of conjunctions. They join sentences and clauses, by relating or referring back directly to something just named. The relatives in English are three—*who*, *which*, and *that*. See **RELATIVE PRONOUNS**.

What is used for *that which*, thus embracing both relative and antecedent. In phrases like 'such a storm as now bursts on them,' *as* is used with the force of a relative pronoun. Perhaps the full expression would be 'such a storm as (the storm that) burst.'

3. **Interrogative Pronouns** are those used in asking questions; they are *who*, *which*, and *what*.

These are the *simple* pronouns. But a variety of compounds are formed by joining these simple pronouns with other words, such as *himself*, *whatever*, *any one*.

Pronouns, as we have seen, express the most abstract relations in language. They are, in fact, the most attenuated and colorless signs of thought conceivable—the highest effort, apparently, of man's generalizing powers. Accordingly, in the days of purely *a priori* speculation on the origin and growth of language, it was held to be indisputable that pronouns must have been the latest product of the language-making faculty; and they have been appealed to as a conclusive argument against the theory that the meaning of all words, when they are traced to their origin, is grounded on sensible properties and relations of material things. The philologist, on the contrary, pursuing his investigations on the historico-comparative method, sees irresistible proof that pronouns, in the Aryan family of languages at least, were among the earliest words in use. In fact, besides their independent use, the same elements are found as suffixes forming the inflections (see **INFLECTION**) of the predicative roots, and first making them real words capable of entering into a sentence. In the beginning, however, they were far from being the impalpable abstractions they afterwards became, and really form the strongest proof of the theory they were supposed to upset. They were, in fact, simply demonstrative particles, indicating palpable relations of space or position ('that' or 'there,' 'this' or 'here,' 'what' or 'where?'). We can easily see how the indication of the vocal sign would at first be helped out and made precise by gesticulation; or more probable still, the gesticulation was at first the fundamental sign, and the word a natural involuntary utterance accompanying it, and in process of time taking its place.

Of the various demonstrative radicals still traceable in the Aryan tongues as pronouns and suffixes, one of the most universal and outstanding is the sound *ta* or *sa* for 'that' or 'this,' 'there.' It is seen in the Sanscrit *sa* (mas.), *sá* (fem.), *tad* (neut.);

Lat. (is) *te*, (is) *ta*, (is) *tu*; Gr. *ho*, *he*, *to*; Goth. *sa* *sô*, *thata*; A.-S. *se*, *sô*, *thæt*; as also in the numerous allied adverbs, e. g., Lat. *tam*, *tunc*; Gr. *dann*; Eng. *so*, *as*, *then*, *thus*. Another demonstrative radical, *ma*, seems to have been used to call attention to the speaker—to point to the immediate or central 'here,' in short, to the 'me.' Besides occurring in the oblique cases of the first personal pronoun, the element *ma* or *m* enters largely into the suffixes of the first person of verbs in the older languages, such as Greek and Latin. The only remnant of it in English is in *I am*. The nominative case of the first person pronoun in Sanscrit is *aham*, which is conjectured to be a mutilation of a fuller form *ma-ga-m*; in Gr. and Lat. *ego*, Goth. *ih*, Ger. *ich*, A.-S. Eng. *I*, Ital. *io*, Fr. *je*, the *m* has completely disappeared. In the oblique cases it has been better preserved. The root of the 2d pers. pron. seems to have been the syllable *tu* or *tea*, indicating a position intermediate between the central 'here' and the more distant and contrasted 'there.' The form of this pronoun is more constant throughout the allied languages than that of any other; Sansc. *tvam*, Lat. *tu*, Gr. *ty* or *sy*, Ger. *du*, Eng. *thou*, Fr. *tu*, Ital. *tu*.

The pronouns of the first and second person are invariable in respect of gender, and are never used as adjectives; the pronouns of the third person not only take the form of adjectives in respect of gender, but are often—especially in the older languages—joined to nouns, in which case they are rather demonstrative (or relative) adjectives than pronouns; as Lat. *ille homo*, Eng. *that book*. It is difficult to trace any etymological relations between the singular and the plural in the first and second pronouns—e. g., between Lat. *tu* and *vos*, or Eng. *thou* and *you*; but this is not to be wondered at when we reflect that 'we' is not equal to 'I' and 'I,' but to 'I' and 'he,' or 'I' and 'thou,' and that 'you' is as much 'thou' and 'he' as 'thou' and 'thou.' The plurals must therefore have been compounded of several elements, which, by coalescence and abrasion, have become irre recognizable.

The declension of the English personal pronouns is to be found in any elementary grammar. That of the third person is made up of fragments of several Anglo-Saxon words. The Anglo-Saxon pronoun was thus declined:

Sing. Nom.	<i>he</i> (he, <i>heó</i> (she), <i>hit</i> (it)
Gen.	<i>his</i> <i>hire</i> <i>his</i>
Acc.	<i>hine</i> <i>hi</i> <i>hit</i>
Dat.	<i>him</i> <i>hire</i> <i>him</i>
Plur. Nom. Acc.	<i>hi</i>
Gen.	<i>hira</i> (heora)
Dat.	<i>him</i> (heom)

The cases marked in italics are still used in modern English, only that *him* and *her* do duty in the accusative as well as dative. *His*, as the genitive of the neuter, has been supplanted in recent times by the secondary genitive *its*, a word which does not occur once in the English version of the Bible. *She* does not represent the Anglo-Saxon *heó*, but *sê*, the feminine of the article. The modern plurals *they*, *their*, *them*, have no direct etymological connection with the singular *he* (she, it); they are taken from the demonstrative or article *thæt* (that, the), which has, in the plural, nominative and accusative *thá*, genitive *thára*, dative *tham*. *Them*, like *him*, was thus originally a dative case. Is it a lingering memory of the demonstrative origin of *them* that keeps alive the vulgar error of 'them things'?

Such being the arbitrary, or rather chance way in which the English pronominal system has been built up out of the wrecks of the Anglo-Saxon, there is no good reason why *them*, *him*, *her*, should not have been used in the nominative as well as in the accusative; and, in fact, in certain connections, these forms, together with *me*, are habitually so used, although grammarians have hitherto refused to sanction the usage. Such expressions as, 'It is me,' 'better than him, than them,' &c., are not confined to the uneducated; in familiar conversation, the most cultivated use them habitually, and in preference to what are considered to be the correct forms, which are felt somehow to be stiff and pedantic. This usage has the analogy of the French in its favor (e. g., *c'est moi*), and some English philologists have begun to defend it on principle. See Alford, *The Queen's English*.

From politeness and other rhetorical motives, various substitutes take the place of the usual personal pronouns. The English language departs little from the normal usage, except in *you* for *thou*, and in the regal and editorial *we*. A French shop-keeper, instead of 'What do you wish to see?' says: 'What does the gentleman (or lady) wish to see?' All modern languages use such substitutions as, 'Your Majesty, Your Excellency, wishes;' but the Italian, in speaking further of the *Esceellenza*, says: 'It (*ella*, she) wishes.' The Germans use regularly *they* (*sie*) for *you*, and one never hears *you* except from the pulpit. In Hebrew, politeness took the form of saying: 'Thy servant said,' for 'I said.' Similarly, the Chinese use: 'little man, subject, thief,

blockhead,' for 'I,' and an American backwoodsman speaks of himself as 'this 'oss,' or 'this here child.'

PROOF. See EVIDENCE.

PROOF OF FIRE-ARMS. Guns of all descriptions are proved before being issued for service. Muskets are tested by being fired with heavier bullets and larger charges of powder than they will in the ordinary way be required to carry. Cannon are subjected to a series of tests. First, they are gauged to ascertain that the dimensions are correct, the utmost variation permitted being .8 inch externally, and .033 in the diameter of the bore, but the position of the bore may deviate .25 inch from the line of the piece's axis. The next trial is by firing twice with heavy charges—the bore being subsequently minutely examined, to detect flaws or crevices in the metal. A cavity exceeding in depth .2 inch, if behind the first reinforce ring, or .25 if before that ring, condemns the piece. After the proof by firing, water is forced at a great pressure into the bore, in order that it may permeate any honeycombs or flaws: the next day, the bore is examined by means of a mirror, which casts a strong light into it. Flaws are then easily detected; for while the rest of the bore is thoroughly dry, water will continue for some time to weep or run from the holes, and will stand over them in drops. This operation completes the proof. When a gun bursts in proof, the remainder of the guns of the same sort then in proof are subjected to another round.

In the case of guns of hitherto untried form, some are tested to bursting, as specimens of the power and endurance of the whole number. For Proof of Powder, see EPROUVETTE.

PROPAGANDA (Lat. *De Propaganda Fide*, Regarding the Propagation of the Faith), the name of a Congregation, and also of a College, in Rome, the object of which is to direct and forward the propagation of the Catholic religion, especially among the heathen; although Christian dissenters from the Roman Church are also included in the sphere of its operations. The institution was originated by Pope Gregory XIII. (1572—1584); but it was fully organized by Gregory XV., who, by a bull of June 22, 1622, established a special Congregation for this purpose, which his successor, Urban VIII. extended and endowed, and to which he annexed a college for the education of missionaries to the several countries; one great feature of which has been to provide for such work natives of the several countries, who are conveyed to Rome at an early age for the purpose of being specially educated in all the necessary learning of a missionary. The Congregation consists of a number of cardinals appointed for life, one of whom is prefect, and who are assisted by a secretary, and by a number of consultants, clerks (*minutanti*), and other officials. This Congregation conducts the affairs not only of the missionary countries, properly so called, but also of those—as England, the northern kingdoms, &c.—in which the hierarchical organization is not, or has not been full and formal. The Catholic Church in these kingdoms is directly subject to the P. in all the details of its government. The College of the P. is a noble institution, containing nearly 200 pupils of all countries, tongues, and complexions, who are not only maintained and educated gratuitously from a very early age, but are equipped and sent forward to their several destinations at the charge of the institution.

The operations of both College and Congregation have been somewhat embarrassed by diminution of funds, consequent on the appropriation of ecclesiastical property to public purposes in the kingdom of Italy; but the want is in a great measure supplied by voluntary offerings. The P. College contains a most valuable library and museum, and a polyglot printing-press. Its great festival is the Epiphany of our Lord, or of His 'manifestation to the Gentiles;' and this feast is celebrated by an exhibition of exceeding interest and curiosity, in which are delivered recitations in every language represented in the College or its missions, amounting often to 50 or 60. Of this festival, the celebrated Cardinal Mezzofanti (q. v.) used to be the guiding spirit. It continues to be one of the chief literary sights of the Roman winter.

PROPAGATION OF THE FAITH, ASSOCIATIONS FOR ROMAN CATHOLIC. The earliest and the highest in dignity of these has been already described under the head PROPAGANDA (q. v.). But the present century has produced several private associations, the resources of which arise almost entirely from voluntary annual contributions, and the organization of which is most complete and most extensive. The first of these is that founded at Lyon in 1822, under the title 'Œuvre de la Propagation de la Foi,' with a branch at Paris, and subordinate branches in the other Catholic kingdoms. It is under the direction of a council at Lyon and Paris, which communicates as well with the local associations through which the funds are supplied by small weekly, monthly, or yearly contributions, as with the missions to the aid of which the fund so raised is applied, by an apportionment regulated according to the necessities of each, especially for the supply of missionaries. The piety of contributors is stimulated by the exhortations of the popes, and the granting of indulgences to those who,

with the other requisite dispositions, shall aid in the work. The journal of the society, entitled *Annales de la Propagation de la Foi*, is a very interesting bi-monthly collection of letters and reports in French from the different missions connected with the central body. The annual receipts of this association are about 5,000,000 francs, mostly raised in France; but some later years' returns have been even more considerable.

Spain, once the great propagator of the Gospel in the New World, contributes very little; but it is to be observed that Spain maintains for her own missionary enterprises a large and liberal establishment in connection with the mission to the Philippines and the South Sea.

Other associations connected with the Propaganda of Rome are the 'Leopoldiner-Verein,' established at Vienna in 1829; and that established in Bavaria as an offshoot of the Lyon association, under the name 'Ludwigs Missions-Verein.'

PROPER, in Heraldry. A charge borne of its natural color, is said to be proper. An object whose color varies at different times and in different examples, as a rose, which may be white or red, cannot be borne proper.

PROPERTIUS, SEXTUS AURELIUS, a Roman elegiac poet of the Augustan Age, was born in Umbria, about 50 B.C., lived at Rome in the brilliant circle of Mæceus, and died 16 B.C. His poems are a collection of elegies which have reached us in an incomplete and corrupt form. Though his addresses to 'Cynthia,' of which most of his poems consist, are marked by intensity of feeling and warmth of passion, P. is a distinctively learned poet; his verse is even rendered highly obscure, and at times for us almost unintelligible, by his wealth of mythological lore and multiplicity of remote allusions. It has often been debated whether P. or Tibullus was the greater poet. In his versification P. was much influenced by Greek models. There are modern editions of the text by Hertzberg, Keil, Haupt, and Müller (1870). There are English translations by Moore (1870) and Cranston (1875). See Davies' *Catullus Tibullus and P.* (1877), and Munro's *Papers on Propertius*.

PROPHECY (Gr. *propheteia*) is a word of pregnant significance. According to its usual acceptation in modern English, it implies *prediction*—the telling of events about to happen beforehand. But neither according to the original meaning of the word prophet in Hebrew (*nabi*) or in Greek (*prophetes*), nor according to historical usage of the verb *prophecy* in English, can such a meaning be considered exclusive. The etymological force of the Hebrew word, according to the best authorities, denotes 'a person who, as it were, bursts forth with spiritual utterances under divine influence, or simply one who pours forth words.' The *Nabi* is the medium of special divine communication—according to some, the man inspired by God to whom divine communications are made; but more distinctively, according to others, the man who delivers the burden of the divine thought imparted to him, who makes known the declarations of God. Besides the more authoritative expression *Nabi*, there are two other expressions (*Roeh* and *Chozeh*) used in the Hebrew original with something of the same meaning, and which are translated in our English version 'seer.' The exact meaning of the several words in their relation to one another has been much disputed. The best view, upon the whole, seems to be that which considers *Nabi* to denote specially the official function of the prophet, the *order* to which he belonged; and the other expressions to point peculiarly to the nature of the prophetic gift—the intuition or vision of the divine. The one may stamp more the objective function of the prophet as a *teller* or *utterer* of the divine, the other more his subjective capacity as a *seer* of the divine.

The original and proper import of the word *prophecy*, therefore, may be said to be the utterance of the divine. The prophet is the 'interpreter of the divine will.' He is expressly called 'the interpreter and the messenger of Jehovah.' The idea of prediction is not of course excluded; but this idea is not a radical and necessary part of the meaning of the word, nor was it at all necessarily an element of the prophetic office. This is apparent from the use of the word even in our English Bibles and our older theological literature. The sons of Asaph, for example, it is said (1 Chron. xxv. 3) 'prophesied with a harp, to give thanks and to praise the Lord,' in the sense of merely singing or uttering God's praise under the dictate of the divine Spirit. It is said also of Philip the Evangelist (Acts xxi. 9) that he had 'four daughters, virgins, which did prophesy,' in the sense merely or mainly of declaring the gospel. In like manner, Bacon speaks in his day of 'an exercise commonly called *prophesying*,' which consisted in the exposition of a portion of Scripture by successive ministers at a meeting appointed for the purpose; and the well-known title of one of Jeremy Taylor's books, *The Liberty of Prophesying*—i. e., the liberty of preaching—recalls the same use of the word.

Prophecy among the Jews was a distinct office or function constituted under the divine sanction. The prophets were an *order*

instituted, or at least reformed and more thoroughly organized by Samuel. There were prophets, indeed, before; Abraham is called a prophet (Gen. xx. 7), and Moses also (Dent. xviii. 15; xxxiv. 10); Aaron is the 'prophet of Moses' (Ex. vii. 1), and Miriam is 'a prophetess' (Ex. xv. 20); but it was Samuel who first established the office as a systematic part of the Jewish religion. For this purpose, he gathered together companies of young men of promising spiritual attainments, who were trained under his superintendence for various religious duties—the exposition of the theocratic law, and the conduct of the theocratic worship, especially of its elaborate musical departments (1 Sam. x. 5; 1 Chron. xxv. 6).

The use of the psaltery and tabret, pipe, harp, and cymbal, was the peculiar business of the prophets. The young men were set apart to make proficiency in these instruments; they were placed under an elderly head or president, who received the name of father, and they were called his sons. They were 'all under the hands of their father for song in the house of the Lord, with cymbals, psalteries, and harps, for the service of the house of God' (1 Chron. xxv. 6). The prophetic institutions have been called by modern divines 'Schools of the Prophets,' but this name does not occur in Scripture, nor even in our authorized version. 'Sons of the Prophets' is the only collective name applied to the separate companies into which they were formed by Samuel. These companies were located in special spots: in Ramah, the birthplace and residence of Samuel; in Bethel, Gilgal, Jericho, and ultimately Jerusalem. They lived in huts made of the branches of trees; wore a simple, characteristic dress; had their meals together, and were found in numbers sometimes of 50, sometimes even of 400. For a prophet not to have been trained in one of these institutions, was deemed, as Dean Stanley says (*Jewish Church*, vol. i. p. 429), 'an exceptional case.' Some, like Isaiah, in Jerusalem, or Elisha in Samaria, lived in great towns, in houses of their own. The higher prophets had inferior prophets or servants attendant upon them, whose duty it was to pour water upon their hands, and secure provisions for them (2 Kings, iii. 11; v. 22). Thus, Moses had Joshua and others; Elijah had Elisha; Elisha had Gehazi. Many of them were married, and had families; for example, Moses, Samuel, Deborah, David, Hosen, Isaiah, Ezekiel. The wife was sometimes, as in the case of Isaiah, called 'the prophetess.'

The prophets, according to this description, were a peculiar order of teachers among the Jews; prophecy, a distinctive part of the divine economy, by which God trained and educated the chosen people. Beginning in a definite, though still unorganized form, with Moses (for it is only incidentally that Abraham is called 'a prophet'), it assumes a regular organization in the hands of Samuel, just when the earlier form of the theocratic government was passing away, and the monarchy was established. It grew up alongside the older institution of the Levitical priesthood without any professed or formal opposition to the latter, but playing a part distinct, and often practically opposed to it. The priests ministered at the altars of sacrifice, and discharged all the official rites of purification enjoined by the Jewish law. They were only secondarily teachers of the people. The prophets, again, while joining in the rites of the tabernacle were primarily and mainly teachers. Their function was moral, and not ritual; they upheld the ethical, spiritual, and eternal side of religion, apt to be obscured under the hardening tendency and ambitious officialism of an influential priesthood. They were the great preachers of a righteous government of the world, and of future retribution amidst the confusions and evils of their time; and prophecy was the ever-renewing and reforming element in the constantly corrupting and decaying policy of Judaism. More particularly, the prophets were both the national historians and poets of the Jewish people, the narrators of its past deliverance, the heralds of its coming glories. The books of Joshua, Judges, Samuel, and Kings, are included among the prophetic books of the Old Testament in the Jewish canon; while the acts of David by Gad and Nathan, of Solomon and Jeroboam by Nathan and Iddo, along with other historical and biographical pieces, have unhappily perished. It is needless to point to the splendid collection of the later prophetic books, beginning with Joel, as containing, along with much direct historical matter also, the most exalted specimens of poetry to be found in any language.

But that which by many has been supposed to be the distinctive character of prophecy, and the special function of the prophets, remains to be noticed. According to the general view of theologians in modern times, prophecy is peculiarly *predictive*, and the essential characteristic of the prophet is supposed to be the power of *foretelling future events*. This view is not warranted, we have seen, either by the etymology of the word, or a comprehensive survey of the facts; but it is nevertheless, undeniable that the Hebrew prophets directed their attention especially to the future, and 'made predictions concerning the fortunes of their own and other countries, which were unquestionably fulfilled.' 'There can be no reasonable doubt, for example,' writes one of

the most liberal of modern theologians, 'that Amos foretold the captivity and return of Israel, and Micah the fall of Samaria, and Ezekiel the fall of Jerusalem, and Isaiah the fall of Tyre, and Jeremiah the limits of the captivity. It was the distinguishing mark of the Jewish people,' adds the same writer, 'that their golden age was not in the past, but in the future; that their greatest hero (as they deemed him to be) was not their founder, but their founder's latest descendant. Their traditions, their fancies, their glories, gathered round the head, not of a chief, or warrior, or sage that had been, but of a king, a deliverer, a prophet, who was to come. Of this singular expectation, the prophets were, if not the chief authors, at least the chief exponents.*' The reality of a succession of Messianic predictions, is admitted by even very advanced theologians; and the more usual opinion, it is well known, regards these predictions from the time of Moses to the time of Malachi as admitting of no question, from the supposed clearness, fullness, and particularity, with which they announce a deliverer, and describe his functions.

'That salvation should come through the family of Abraham, Isaac, Jacob, Judah, David; that at the time of the final absorption of Jewish power, Shiloh (the tranquillizer) should gather the nations under his rule; that there should be a great prophet typified by Moses, a king descended from David, a priest for ever typified by Melchizedek; that there should be born into the world a child, to be called Mighty God, Eternal Father, Prince of Peace; that there should be a righteous servant of God on whom the Lord should lay the iniquity of us all; that Messiah, the Prince, should be cut off, but not for Himself; that an everlasting kingdom should be given by the Ancient of Days to one like the Son of Man. It seems impossible to harmonize so many apparent contradictions. Nevertheless, it is an undoubted fact, that at the time seemingly pointed out by one or more of these predictions, there was born into the world a child of the house of David, and therefore of the family of Abraham, Isaac, Jacob, and Judah, who claimed to be the object of these and other predictions; who is acknowledged as Prophet, Priest, and King, as Mighty God, and yet as God's righteous servant, who bears the iniquity of all; who was cut off, and whose death is acknowledged not to have been for His own, but for others' good; who has instituted a spiritual kingdom on earth, which kingdom is of a nature to continue for ever, and in whose doings and sufferings on earth a number of specific predictions were fulfilled. Then we may say that we have here a series of prophecies which are so applicable to the person and earthly life of Jesus Christ, as to be thereby shown to have been designed to apply to Him; and if they were designed to apply to Him, prophetic prediction is proved.'—Smith's *Dictionary of Bible*, art. Prophecy.

Such is the common view of prophecy. It has, indeed, been maintained by certain writers, that *liberal prediction* has no place in prophecy; that Isaiah did not foretell the Babylonian Captivity, or the fall of Tyre, nor Jeremiah the Seventy Years' Captivity, nor Nahum the ruin of Nineveh; and that the Messianic prophecies were merely 'ardent hopes and poetical descriptions' of a glorious future, into which the prophetic mind naturally projected itself. Such delineations were 'in essence nothing but *forebodings*—efforts of the spiritual eye to bring up before itself the distinct form of the future: to make such presentiments into *historical declarations*, is to mistake their character.'—Davidson's *Introduction*, vol. iv. But this is not the ordinary theory of prophecy, either among Jews or Christians. Both alike recognize the reality of the predictive element, however differently they may interpret and apply the prediction. They contend not only for a special spiritual elevation in the prophet—an intenser degree of the same divine intuition which God gives to all who worship Him in love and reverence—but for a gift of life vouchsafed to him different from any ordinary endowment. Prophecy is not merely the effluence of the divine Spirit enriching and exalting all the natural faculties, but it is the direct communication of God Himself, to the prophet unveiling the future for the guidance of His church, and the glory of His name.

The further study of the subject may be pursued by readers in numerous volumes, amongst which the following may be recommended: John Smith, *Select Discourses on Prophecy*; Lowth, *De Sacra Poesi Hebræorum*; Davison, *Discourses on Prophecy*; Butler, *Analogy of Religion*; Horne, *Introduction to Holy Scripture*; Eichhorn, *Die Hebräischen Propheten*; Ewald, *Die Propheten des Alten Bundes*; Hengstenberg, *Christology of the Old Testament*; Fairbairn, *Prophecy*; Davidson, *Introduction to the Old Testament*; Stanley, *Lectures on the Jewish Church*.

PROPOLIS, a substance used by bees in the construction of their combs, to give to the fabric a strength which it could not have if made of wax alone. See BEE. It is also used for closing up chinks of the hive. It is a resinous unctuous substance of a reddish-brown color, a somewhat bitter taste, and an agreeable aromatic odor, and is collected from the buds of trees. Huber

found bees eagerly to appropriate the viscous exudation which abounds on poplar buds. P. probably differs a little in chemical composition according to the tree it is obtained from, but it consists chiefly of resin. It is brought to the hive on the legs of bees, and adheres to them so strongly that the assistance of other bees is necessary for its removal. The name is from the Greek *pro*, before, and *polis*, a city; because the most exposed parts of a beehive exhibit this substance in greatest abundance. Foreign bodies introduced into a bee-hive, and which the bees are unable to remove, are covered with propolis.

PROPORTION, in Arithmetic and Geometry, is a particular species of relation subsisting between groups of numbers or quantities. Notwithstanding that the idea of proportion is found to exist in perfection in the mind of every one, yet a good definition of it is a matter of extreme difficulty. The two definitions which, on the whole, are found to be least objectionable are that of Euclid, and the ordinary arithmetical definition. The latter states proportion to be the 'equality of ratios,' and throws us back on the definition of the term *Ratio* (q. v.); which may most simply be considered as the relation of two numbers to each other, shown by a division of the one by the other. Thus, the ratio of 12 to 3,

expressed by $\frac{12}{3}$, or 4, denotes that 12 contains 3 four times; and

the ratio of 8 to 2 being also 4, we have from our definition a statement that the four numbers, 12, 3, 8, and 2, are in proportion, or, as it is commonly expressed, 12 bears to 3 the same ratio that 8 does to 2, or 12 : 3 :: 8 : 2. In the same way, it is shown

that 3 : 8 :: 18 $\frac{1}{2}$: 36; for $\frac{3}{8}$ expresses the ratio of the first to the

second, and $\frac{18\frac{1}{2}}{36} = \frac{27}{72} = \frac{3}{8}$. It will be gathered from the two

arithmetical proportions here given, and from any others that can be formed, that 'the product of the first and last terms (the extremes) is equal to the product of the second and third terms (the means);' and upon this property of proportional numbers directly depends the arithmetical rule called 'proportion,' &c. The object of this rule is to find a fourth proportional to three given numbers—i. e., a number to which the third bears the same ratio that the first does to the second, and the number is at once found by multiplying together the second and third terms, and dividing the product by the first. Proportion is illustrated arithmetically by such problems as, 'If four yards cost six shillings, what will ten cost?' Here, 15 being the fourth proportional to 4, 6, and 10, fifteen shillings is the answer.

The distinction of proportion into *direct* and *inverse* is not only quite unnecessary, but highly mischievous, as it tends to create the idea, that it is possible for more than one kind of proportion to subsist. *Continued proportion* indicates a property of every three consecutive or equidistant terms in a 'Geometrical Progression' (q. v.)—for instance, in the series 2, 4, 8, 16, 32, . . . 2 : 4 :: 4 : 8 :: 8 : 16, &c., or 2 : 8 :: 8 : 32, &c. In the above remarks, all consideration of *Incommensurable Quantities* (q. v.) has been omitted.—The definition given by Euclid is as follows: Four magnitudes are proportional, when any equimultiples whatever being taken of the first and third, and any whatever of the second and fourth, according as a multiple of the first is greater, equal to, or less than that of the second, the multiple of the third is also greater, equal to, or less than that of the fourth—i. e., A, B, C, D are proportionals, when if mA is greater than nB, mC is greater than nD; if mA is equal to nB, mC is equal to nD; if mA is less than nB, mC is less than nD; m and n being any multiples whatsoever. The apparent cumbersomeness and circumlocution in this definition arise from Euclid's endeavor to include incommensurable quantities; throwing them out of account, it is sufficient to say that four magnitudes are proportional, if, like multiples being taken of the first and third, and like of the second and fourth, when the multiple of the first is equal to the multiple of the second, the multiple of the third is equal to the multiple of the fourth. Abundance of illustrations of the general definition will be found in the Fifth Book of Euclid, and of the particular one in the notes appended to some of the later editions of the same work; it will be sufficient here to give an arithmetical instance of the working of the particular definition. Taking the four numbers of a previous example—12, 3, 8, 2; of 12 and 8 take multiples by 4, and of 3 and 2 by 16, then 12 × 4 (the multiple of the first) = 3 × 16 (the multiple of the second), and 8 × 4 (the multiple of the third) = 2 × 16 (the multiple of the fourth). In this example, the two multiples were so taken that the multiple of the first would be equal to the multiple of the second, and when it was found that the multiple of the third was also equal to the multiple of the fourth, the proportionality of the four numbers was established.

* Dean Stanley, *Jewish Church*, vol. i. p. 496.

PROPOSITION. This is the technical name for the final constituent, or ultimate element, of whatever we call knowledge—what we can believe or disbelieve. 'Fire melts wax;' 'the harvest is good;' 'Rome stands on the Tiber;' 'the moon is not inhabited'—are propositions. All information, whether historical, scientific, or practical, may be resolved at last into simple statements such as these; and all such statements are propositions. In every proposition, there are two parts: something spoken about, called the Subject; and something said, affirmed, or declared of what is spoken about, called the Predicate. In the first example given, 'Fire' is the subject, 'melts wax' is the predicate or affirming part, to which a verb is necessary. In the second example, 'Harvest' is the subject, 'is good' the predicate. But sometimes this last part is resolved further into Predicate (good) and Copula (is). The predicate then simply means the quality or fact affirmed, while the copula gives the affirmation. In the previous case, the copula is contained in the predicate (melts).

Propositions are *affirmative* or *negative*, according as we declare that a thing is, or that it is not: 'the moon is (not) inhabited.' As some propositions contain the form of a condition, and some the form of an alternative, these are called *hypothetical*, in opposition to which the rest are called *categorical*. If A is B, C is D, is the *conditional* form of the hypothetical class. Either A is B, or C is D, is called the *disjunctive* form.

Propositions are further divided, according to their quantity, or according to the extent of the subject, into *universal*, *particular*, *singular*, and *indefinite*; 'all the moving powers are originally derived from the sun' (universal); 'some men are wise' (particular); 'Socrates is wise' (singular). The 'indefinite' means the uncertain or ambiguous in form, as 'wine is good;' many of this form are known to be universal, as 'man is mortal.'

In inquiring into the ultimate import or meaning of propositions, Mr. John Stuart Mill came to the conclusion that they fall under five classes, distinguished according to the nature of the quality predicated. The five universal and comprehensive predicates are—Existence, Co-existence (sometimes taking the form of Order in Place), Succession (Order in Time), Causation, Resemblance. Every fact, or piece of information, consists in the affirmation of some one of these five general attributes. Existence by itself expresses a very limited class, since we usually specify circumstances of time, place, &c., in the same assertion: 'There is an ether for conveying light and heat,' is a proposition of Existence; but it would be more usually stated as having locality (Order in Place, or Co-existence); 'an ethereal medium is diffused over all space.' Existence is the only one of the five attributes that can be affirmed of one thing; all the rest require at least two things.

The attribute of Co-existence appears in a very large number of propositions; all geographical statements and local descriptions; all the natural conjunctions of properties (the animal frame consists of digestive organs, a nervous system, &c.), affirm co-existence. The attribute of Succession is seen in history, and in all the changing aspects of things. The attribute of Causation is a special case of Succession, so important as to be raised to the rank of a first-class predicate. The facts of physical and mental science involve not merely succession, but cause and effect: 'Heat expands bodies;' 'practice improves the human faculties.' The concluding attribute—Resemblance—is of very wide occurrence. The propositions of numerical or mathematical science all involve some assertion of equality or inequality, proportion or disproportion: 'Twice three is (equal to) six;' 'triangles in the same base and between the same parallels are equal.' Throughout all our knowledge, the affirmation of likeness, or of unlikeness, is a fundamental fact; but, in mathematics, it constitutes the characteristic predicate, or the sole affirmation.

PROROGATION the continuance of parliament from one session to another. Parliament is prorogued by her Majesty's command, signified in her presence by the Lord Chancellor, or Speaker of the House of Lords, to both Houses, or when her Majesty is not personally present, by writ under the Great Seal, or by Commission. Prorogation not only suspends all business, but quashes all proceedings pending at the time, except impeachments by the Commons, and writs of error and appeals before the House of Lords. A bill must be renewed after a prorogation, as if it had never been introduced. A prorogation for a single day has sometimes been resorted to, to enable a bill to be brought in a second time, it being a rule that no second bill of the same substance with a prior one can be introduced in the same session. Thus parliament was prorogued by William III. from the 21st to the 23d of October 1689, in order to renew the Bill of Rights, regarding which a difference had arisen between the Upper and Lower House that was fatal to it. By 37 Geo. III. c. 127, after parliament has been prorogued to a particular day, her Majesty may, by proclamation, call it together on any other day, not less than 14 days distant, to which day parliament then stands prorogued. See PARLIAMENT.

PROSECUTION, though often used in a general sense, as applicable to all kinds of litigation, is also used technically to denote the institution of criminal proceedings against a party. There are two ways in which a prosecution commences in England. One is to summon, or, in the graver cases, to arrest and bring the offender before a justice of the peace, when the witnesses are examined, and if the justice thinks a *prima facie* case is made out, he commits the offender for trial. Another way is without any such preliminary inquiry before a justice, for the prosecutor to go with witnesses before a grand jury, and in all cases this is a step in the prosecution. The grand jury hear the witnesses, and if they think there is a *prima facie* case, they find a true bill; if otherwise, they ignore the bill. The bill means an indictment. When the indictment is found, the prisoners are arraigned at the bar, and asked by the judge whether they plead guilty or not guilty; and in general they plead not guilty. A jury of twelve are then sworn, and try the case, and find a verdict of guilty or not guilty, whereupon the judges sentence the prisoner to punishment, which varies according to the enormity of the offence. In general, a new trial cannot be held in criminal cases, though, if an error is committed, the conviction is often quashed.

PROSECUTOR is the person who takes the initiative in punishing crimes. In England, the time-honored custom is that there should be no public prosecutor, and that the prosecution of crimes should be left to the spontaneous action of the injured party. Hence many crimes have gone unpunished, from its not being anybody's business to attend to this part of the public interest. It is true that the attorney-general is sometimes the prosecutor on behalf of the public, but this only happens in rare and exceptional cases. In 1879, however, an act more effectually providing for the prosecution of offences in England, was passed, enacting that the secretary of state may from time to time appoint an officer to be called the Director of Public Prosecutions, whose duty it shall be, under the superintendence of the attorney-general, to institute, undertake, or carry on criminal proceedings. Also the Director may have six assistants allotted to him. It was provided that this act should not interfere with the right of any person to institute criminal proceedings. Ordinarily, it has been left to the uncontrolled discretion of anybody to commence a prosecution. The injured person or his friends may have sufficient motive to prosecute; but a stranger will not readily undertake a prosecution. When there is no public prosecutor, he who prosecutes does so more or less at his own expense, and in the first instance must always do so. He must employ his own attorney and counsel, who, of course, require to be paid for their services. It is true that the expenses of prosecuting most crimes are supposed to be ultimately repaid by the county in which the trial takes place; but this allowance is a wretched pittance, and is seldom one-fourth of the real expenses incurred by the private prosecutor. Hence, in the end, the prosecutor finds that he loses a great deal of money as well as time in carrying on a prosecution. Indeed, in practice, the result is, that no person to whom his money is of much consequence ever prosecutes a second time, and the first time he almost invariably does so in ignorance of the pecuniary result, there being a vague kind of popular belief that the expenses are repaid. Few people, indeed, fail to repent of embarking in such a litigation; and the prudent and experienced are in the habit of remarking, that prosecutions are only kept going by the unbroken succession of young and inexperienced persons who do not know better.

A person who prosecutes a small larceny of five shillings may incur expenses of from five to fifteen pounds, which is money out of pocket when his attorney's bill is paid. But not only is there great expense and loss in the mere prosecution itself; there are far more grievous consequences. If it happen—and it seems in about half of the cases it really does happen—that the prisoner is not found guilty, or the case breaks down from defective evidence or otherwise, the first thing that the prisoner does is to bring an action for false imprisonment or for malicious prosecution, against the prosecutor. It is said that attorneys infest all the police courts and petty sessions, by keeping an organized service of watchers to pick up cases of this kind, which are called speculative actions. The speculative attorney promises to take the chance of gaining the action, and, of course, as it costs the prisoner nothing, he readily lends his name, and, out of revenge, joins keenly in the attempt to recover large damages. It is true that in all such cases the prosecutor ought not in theory to lose the verdict, if he acted under a reasonable and honest belief that a crime had been committed; but however plausible this defence may be in theory, it is a very different thing to establish it in practice. At the trial of the action, counsel on such occasions enlarge on the monstrous oppression of having given an innocent man into custody, blasting his character and reputation for life, and attributing the prosecution to spite or malice; and as the presumption is always in favor of innocence, it is astonishing how easily a jury may be led away by a spurious sympathy in favor

of the quondam prisoner. It is thus entirely a lottery in such cases how the verdict will go, and verdicts of ten, fifty, or a hundred pounds of damages are often obtained, simply because of the accidental defect of some conclusive piece of evidence, with which the defendant in the action had probably no more to do than any other person. When the quondam prosecutor is a person of substance and position—and, of course, a speculative attorney will not sue those who are not so—he often finds it prudent to compromise the action by paying a lump sum, rather than run the risk of a trial.

Many attorneys in the metropolis and large towns of England carry on a large and lucrative business by systematically bringing these speculative actions against unsuccessful prosecutors. The evils of this state of the law have been often complained of, but the remedy has long been delayed, probably because other systems of prosecuting crime are open to objections.—In Scotland, a well settled system of public prosecutors has long been in operation, which avoids most of the evils already described. The Lord Advocate is *ex officio* the public prosecutor, and there are counsel called advocates-depute who assist him, besides a local functionary called a Procurator-Fiscal (q. v.) in all parts of the country. The public prosecutor's duty and business is to act on all reasonable suggestions that a crime has been committed, but he is not compelled to prosecute. If he refuse to do so, a private party may at his own risk, with the concurrence of the Lord Advocate, insist on the prosecution; but he may be called on to find caution or give security. The usual course is for the procurator-fiscal to take the pretognitions; i. e., the examination of witnesses before the sheriff, a copy of which is laid before the crown-counsel, and if they are satisfied that a *prima facie* case is made out, the proceeding is carried on to trial; but if there is not sufficient evidence, the prisoner is ordered to be at once discharged. The entire expense of prosecuting crime in Scotland, whether at the higher or local tribunals, is borne by the public; the persons specially injured having nothing whatever to do in the matter except appear as witnesses when called upon. This system has worked for three centuries with entire satisfaction.

PROSELYTES (Gr. *pros-elytos*, one who comes from without, a stranger; Hebr. *Gerim*) was the name given by the Jews to those heathens who became converts to Judaism. There were two kinds of proselytes distinguished: 'Proselytes of the Gate,' that is, heathen strangers, who, in order to be allowed to reside in Palestine, had undertaken to submit to the 'Seven Commandments of the Sons of Noah, that prohibit blasphemy, idolatry, murder, incest, theft, disobedience to the authorities, and the eating of flesh with the blood in it: commandments which probably had grown out of certain restrictions originally put upon the 'strangers' by the Mosaic Law (Exodus, xii. 19; xx. 10, &c.). These 'Proselytes of the Gate,' or 'Sojourners,' could not claim all the privileges of an Israelite, could not redeem their first-born, and, at a later period, were not allowed to live in Jerusalem; yet they were permitted to offer whole burnt-offerings, and otherwise contribute towards the religious wants of the commonwealth. The second class of proselytes was formed by the *Gere hatsedek* (Pious Proselytes), or *Gere haberith* (Proselytes of the Covenant). These accepted all the dogmas and customs of Judaism to their fullest extent, and were called 'Complete Israelites.' The new candidates were first strictly asked for their motives, and the classification of those who were not to be admitted runs as follows: those whose motive is love (husband for the sake of following his wife's faith, or *vice versa*); Proselytes of the Tables of the Kings (i. e., those who covet court favor); Esther-Proselytes (who wish to escape some threatening danger; cf. Esther viii. 7); and Lion-Proselytes (those who, from a superstitious fear, wish to enter Judaism like the Samaritans, 2d Kings, xvii. 26). If, on the other hand, the motives were satisfactory, the candidate was further cautioned against attaching himself to a persecuted people, and warned that sufferings of all kinds would be his lot in this life. If all this did not deter him, he was 'brought under the wings of God.' He was fully instructed in the religion and history of the people, and shown the special Providence that guided them and watched over them. If a male, he was circumcised, and, in case of his being circumcised already (for instance, if he belonged to another nation practising this rite), a few drops of blood were drawn 'from the blood of the covenant,' a special prayer was said for him, and a new name was given to him, while for that of his father, Abraham was substituted.

After the healing of the wound, Baptism (Tebillah) followed, and he had further to offer up a Sacrifice (Korban). Females had likewise to undergo baptism and to bring a sacrifice. All natural relations were then cancelled, the Proselyte was considered like 'a new-born child,' and the Holy Ghost was supposed to come upon him.

The desire to proselytize, which became strong among the political leaders during the Maccabean period, and which led to the 'bringing into the Congregation' of entire nations, such as the

Idumeans under John Hyrkan, the Ituræans under Aristobulus, contrasted strongly and most characteristically with the utter contempt in which the new-comers were held by the people, and with the suspicion with which they were regarded, and their (after all) limited social rights and ambiguous position. The Talmud speaks of them in no measured terms, and there is no doubt that, on the whole, they must have acted a very dubious part. They were called the Leprosy of Israel; it was the Proselytes and other reprobates who stood in the way of the coming of the Messiah; and up to the twenty-fourth generation were they to be distrusted. Yet, notwithstanding all this, conversions were very frequent, especially among the better classes—and here, again, among women principally—in Damascus, Greece, Asia Minor, Rome; so much so, that even the Roman legislation was compelled, in the 1st c. B.C., to provide for cases of Judaizers. It is a curious fact, worth remembering, that one of the main features of the times of the Messiah was to be, according to Jewish tradition, the utter abolition of proselytism, and the entire ceasing of all distinctions of an opprobrious nature among men. The evil repute into which the term Proselyte had fallen in the times of Christ also caused the early converts to Christianity to adopt the name of Neophytes (newly planted) instead.

PROSERPINA, the Latin form of the Greek PERSEPHONE (also PERSEPHATTA, PERSEPHASSA, PHEREPHASSA, in Homer, PERSEPHONEIA), was, according to the common myth, the daughter of Zeus and Demeter (Ceres) or of Styx. The story of her abduction by 'gloomy Dis,' while gathering flowers on the plains of Enna, in Sicily, in company with Artemis and Athena, does not occur in Homer, who simply represents her as the wife of the king of Hades, and as the majestic queen of the Underworld—a subterranean Hera (Juno). It is first given by Hesiod, and is manifestly an allegory of the seasons. See CERES. In the mystical Orphic Hymns, P. appears as the all-pervading goddess of nature, who produces and destroys everything, and she has been mixed up and identified with other mystical goddesses, Rhea, Artemis, Hekate, &c. She was generally worshipped under the name of *Kore*, 'maiden,' along with her mother Demeter. The chief seats of her worship were Sicily and Magna Græcia; but she had also temples at Corinth, Megara, Thebes, and Sparta. In works of art, P. is represented sometimes as the grave and earnest spouse of Pluto, sitting on a throne beside her sombre husband, with a sceptre and a little box; but more frequently as a blooming virgin, the picture of her mother, in the act of being carried off to Hades.

PROSODY (Gr. *prosodia*, literally belonging to song or hymn) is the name given, both by the ancients and moderns, to that part of grammar which treats of the rules of rhythm in metrical composition. See METRE, RHYME, BLANK VERSE.

PROSPECT, in Roman Law, was recognized as a legal incident of a house, or an urban servitude, so that no adjoining owner was entitled to obstruct the prospect or view of a man's house. But if this meant more than that the light should not be sensibly obstructed, it is not recognized in English or Scotch law. See LIGHT.

PROSSNITZ, a manufacturing town of Austria, in Moravia, in the fruitful plain of Hanna, stands on the Rumza, 12 miles southwest of Olmütz. It has manufactories of woollen cloths, cashmeres, linen and cotton stuffs, distilleries, and breweries. Pop. (1880) 18,417.

PROSTITUTES, LAW AS TO. It is not an offence, in this country, for a person to carry on a course of prostitution in his or her own person; but when others are incited, or forced to that course, it may become so, in certain circumstances. Thus, for a person to keep a disorderly house, is an indictable offence, which is punishable by fine and imprisonment, and the parish officers in England are bound to institute the prosecution, the expenses of which are paid out of the poor-rates. It is, however, only the person who keeps the house who is punishable, and no punishment can be imposed on the frequenters of the house in any circumstances. The law may be said to be passive so far as the mere fact of prostitution or immoral intercourse is concerned, and gives neither party any remedy against the other, civil or criminal, arising out of that state of the relations between man and woman. Thus, if a man give a woman a bond, providing her an annuity in consideration of her living with him in concubinage, the law will not enforce it, because it is an immoral consideration. So, if a woman take lodgings, or buy dresses, for the purpose of carrying on a course of prostitution, the law will not enforce the payment of rent, or the price of the goods sold, because the tendency is immoral. In some countries, as in France, the law takes direct cognizance of the fact of prostitution, and deals with prostitutes for various sanitary purposes. In this country no legislative action of this kind was taken till 1864-68, when acts were passed, applying only to certain naval and military stations—viz., Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Colchester, Shorncliffe, the Curragh, Cork, and Queenstown,

but not to Scotland. In those places a justice of the peace may now, on information, order a woman to be taken to a certified hospital for medical examination; and if she is found to have a contagious disease, she may be detained in the hospital for medical treatment during not more than three months. A woman who refuses to submit to examination, or leaves the hospital without being duly discharged, is liable to be imprisoned for one or two months. A resolution by Mr. Stansfeld was adopted by the House of Commons in 1883, condemning compulsory examinations, and asking government to legislate in a sense consistent with that resolution. In India, where the same act was in force, it was repealed by the Governor-General. See **CONTAGIOUS DISEASES ACTS**.

PROSTYLE. A temple with a portico in front. When it had a portico at both ends, it was termed amphiprostyle.

PROTAGORAS, the Greek Sophist, was a native of Abdera, where he was born of humble parentage, probably about 480 B.C. He was the first who took the name of 'Sophist,' or taught for pay. When he went to Athens, is not precisely known; but he is conjectured to have gone thither about the middle of the century, and he seems to have enjoyed the friendship of Perikles. Accused of atheism by one of his own scholars, he was banished from Athens, and his writings were ordered to be publicly burned. He died, probably in 411 B.C. The basis of his speculation is the proposition, that 'man is the measure of all things,' which was developed by him in a way that involved the most thorough-going scepticism. The *Theætetus* and *Protagoras* of Plato are devoted to a refutation of P.'s doctrines, which, as delineated by the great philosopher, appear shallow, confused, and untenable. All P.'s works are lost, though some were extant as late as the time of Porphyry.

PROTEACEÆ, a natural order of exogenous plants containing about 650 known species of shrubs and small trees, chiefly natives of South Africa and of Australia, and forming a remarkable feature of the vegetation of these regions. Some of them, as species of *Protea* and *Banksia* (q. v.), are frequently cultivated in gardens and greenhouses, being prized for their singular and elegant appearance, and their curious and often beautiful flowers. They have usually umbellate branches; their leaves are evergreen, and remarkably hard, dry, and woody, divided or undivided, and without stipules. The perianth is four-leaved or four-cleft; the stamens, four, one of them sometimes sterile, perigynous, opposite to the segments of the perianth; the ovary superior, consisting of a single carpel, with one, two, or many ovules; the style simple, the stigma undivided; the fruit dry or succulent, and opening or not opening, many fruits often collected in a kind of cone. The timber of some of the larger species is used for various purposes; others supply much of the firewood of the Cape of Good Hope and Australia. The nuts or seeds of some are eaten, as those of *Brabejum stellatum* in South Africa, and of *Guevinia Avelana* (also called *Quadria heterophylla*) in Chili. Those of the latter are much esteemed, and are called *Avelanas* and *Nebus*.

PROTECTION—PROTECTIVE DUTY, in Political Economy, terms applied to a practice, now in disuse in Britain, of discouraging, by heavy duties and otherwise, the importation of foreign goods, under the notion that such a practice increased the prosperity of the country at large. See **FREE TRADE**.

PROTECTOR, a title which has sometimes been conferred in England on the person who had the care of the kingdom during the sovereign's minority. The Earl of Pembroke was Protector in 1216, in the minority of Henry III. Humphrey, Duke of Gloucester, held the same office in the minority of Henry VI., from 1422 to 1447. Richard, Duke of Gloucester, was Protector in 1483, prior to his ascending the throne as Richard III. The Duke of Somerset, one of King Henry VIII.'s sixteen executors, was in 1548 constituted Protector during the minority of Edward VI., with the assistance of a council, consisting of the remaining fifteen executors; a dignity, however, which he enjoyed but a few months. Oliver Cromwell, in December 1653, took the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland. In 1658, his son Richard succeeded to his title and authority, but was never formally installed in the Protectorate, which he resigned in the following year.

PROTEIN AND THE PROTEIN BODIES. Under the term *Protein Bodies*, chemists include the following substances: Albumen, Fibrin, Syntonin or Muscle-fibrin, Casein, Globulin, and Hemato-crystallin. Albumen, fibrin, and casein are common both to the animal and vegetable kingdom; while the three others occur only in the animal kingdom (namely, in muscular tissue, in the crystalline lens of the eye, and in the blood-cells). The most careful analyses have shown that in their composition, these substances are almost identical, and that they all contain about 53.6 per cent. of carbon, 7.1 of hydrogen, 15.6 of nitrogen, and 22.1 of oxygen, with a varying quantity of sulphur not exceeding 1.6 per cent. These substances are as similar in many of their prop-

erties, and in the products or their decomposition, as in their ultimate composition, and hence chemists were naturally led to entertain the view that they possessed a common radical.

Mulder (q. v.) announced, in 1838, that he had discovered this radical, which, from its importance, he named **PROTEIN** (Gr. *proteus*, I hold the first place), and that he had found that albumen, fibrin, casein, &c. (which at that period were known as the *albuminous bodies*, the *albuminoid group*, or the *albuminates*), were combinations of this protein with sulphur and phosphorus, or simply with sulphur. The composition of this protein is represented according to the discoverer, by the formula $C_{12}H_{19}N_3O_2 \cdot 2HO$. Liebig and several of his pupils have, however, shown that Mulder's protein always contains a small but variable amount of sulphur; and they deny, on what are generally deemed sufficient grounds, the existence of protein as a separate body. The term *protein bodies*, or *protein compounds*, is, however, commonly retained both by physiologists and chemists, as being the most convenient one for representing a class of compounds, which, whether Mulder's theory is correct or not, deserve their name from their constituting the group which form the most essential articles of food.

The **PROTEIN BODIES** may be generally described as nearly colorless, neutral, nitrogenous bodies, soluble in potash solution, and not yielding gelatin when boiled with water. They all present two modifications, differing essentially from one another; in one of which they are soluble, and in the other nearly or quite insoluble. They exist naturally only in the soluble modification, although not necessarily in a state of solution. Most of them are transformed into the insoluble state by boiling, by the mineral acids, and by numerous salts; and one of them, fibrin, undergoes this modification on simple removal of the blood, or other fluid containing it, from the organism. This passage from the soluble into the insoluble form, is termed *coagulation*, but we do not know what chemical change takes place in the process.

The *soluble protein bodies*, in their dried state, form pale yellow, translucent masses, devoid of smell and taste, which are soluble in water, but insoluble in alcohol and ether. They are precipitated from their watery solutions by alcohol, by the mineral acids, by tannic acid, but not by the vegetable acids generally; and by many mineral oxides and salts. The *insoluble protein bodies*, when freshly precipitated, are of a white color, in flakes or small clots, or viscid and glue-like: when dried, they may be reduced to a whitish powder.

The products of the decomposition of the protein bodies are very numerous, and the study of these products is of great importance, as tending to elucidate the changes which the tissues undergo in the body during their disintegration.

PROTEST is in law a legal document, drawn up by a notary-public, giving notice of some act of a public nature, as the protest of a bill of exchange.

PROTESTANT, a term first applied to the adherents of Luther, from their protesting against the decree passed by the Catholic states at the second diet of Speier in 1529. This decree had forbidden any further innovations in religion, and enjoined those states that had adopted the Reformation so far to retrace their steps as to reintroduce the Mass, and order their ministers to avoid disputed questions, and to use and explain the Scriptures only as they had hitherto been used and explained in the church. The essential principles involved in the protest, and in the arguments on which it was grounded, were: 1. That the Catholic Church cannot be the judge of the Reformed churches, which are no longer in communion with her. 2. That the authority of the Bible is supreme, and above that of councils and bishops. 3. That the Bible is not to be interpreted and used according to tradition or use and wont, but to be explained by means of itself—its own language and connection. As this doctrine, that the Bible, explained independently of all external tradition, is the sole authority in all matters of faith and discipline, is really the foundation stone of the Reformation, the term Protestant was extended from those who signed the Speier protest, to all who embraced the fundamental principle involved in it; and thus Protestant churches became synonymous with the Reformed churches. The essence of Protestantism, therefore, does not consist of holding any special system of doctrines and discipline, but in the source from which, and the way in which it proposes to seek for the truth in all matters of faith and practice; and thus a church might, in the progress of research, see reason to depart from special points of its hitherto received creed, without thereby ceasing to be Protestant. The Symbols or Confessions of the Protestant churches were not intended as rules of faith for all time, but as expressions of what was then believed to be the sense of Scripture. When, at a later time, it was sought to erect them into unchangeable standards of true doctrine, this was a renunciation of the first principle of Protestantism, and a return to the Catholic principle; for, in making the sense put upon Scripture by the Reformers the standard of truth, all further investigation

of Scripture is arrested, the authority of the Reformers is set above that of the Bible, and a new tradition of dogmas and interpretation is created, which differs from the Catholic tradition only in beginning with Luther and Calvin, instead of with the apostolic fathers. See REFORMATION.

PROTEUS, in the Homeric or oldest Greek mythology, appears as a prophetic 'old man of the sea' (*halios geron*), who tends the seal-flocks of Poseidon (Neptune), and has the gift of endless transformation. His favorite residence, according to Homer, is the island of Pharos, off the mouth of the Nile; but according to Virgil, the island of Karpathos (now *Skarpanto*), between Krete and Rhodes. Here he rises at mid-day from the floods, and sleeps in the shadow of the rocky shores, surrounded by the monsters of the deep. This was the time when those who wished to make him prophesy sought to catch him. But it was no easy task. P., unlike most vaticinal personages, was very unwilling to prophesy, and tried to escape by adopting all manner of shapes and disguises. When he found his endeavors hopeless, he resumed his proper form, and then spoke out unerringly about the future.

PROTEUS, a genus of perennibranchiate Batrachia (q. v.), having a long, smooth, naked, eel-like body; four small and weak legs; the fore-feet three-toed—the hinder, four-toed; the tail compressed and forming a kind of fin; the head lengthened and flattened; the eyes extremely small, and covered by the skin; the ears concealed in the flesh; the gills external and permanent,

Proteus (*P. anguinus*).

reddish, very conspicuous, between the head and the fore-legs. Notwithstanding the permanent external gills, there are also lungs in the form of simple slender tubes, terminated by a vesicular dilatation. The only known species, *P. anguinus*, is found in subterranean lakes, in the great limestone caverns in Carniola. It seems to live chiefly in the mud which forms the bottom of the lakes or pools; but almost nothing is known of its habits. It is of a pale rose or flesh color, 10 or 12 inches long, seldom above half an inch in thickness. Specimens have been kept alive in confinement for several years, in a darkened aquarium, apparently without food. One which ate a worm died soon after. The blood-corpuscles of the P. are extremely large.

PROTEUS, a name given by many naturalists to certain animalcules remarkable for changefulness of form; on which account also, as the name P. has been otherwise appropriated in science, they now receive the generic name *Amœba* (Gr. vicissitudo). They are *Protozoa*, and ranked among the *Rhizopoda*. See these heads. They are found in fresh water, and are generally from $\frac{1}{100}$ th to $\frac{1}{50}$ th of an inch in diameter, when they assume a somewhat globose form, which, however, they exchange for almost every imaginable shape, so that they cannot be described as having any proper or definite shape whatever. They

Proteus or Amœba (very highly magnified).

consist of a transparent gelatinous substance (*sarcode*), or protoplasmic matter, which is divisible into two layers, an outer (*ectosarc*) and an inner (*endosarc*). The *ectosarc* is highly contractile, and can be protruded into blunt finger-like processes called *pseudo-podia* (false-feet), by which the animal is enabled to move along, and by which it procures its food, such as adiatom, which it draws into its substance, there being no mouth; and the effete matters are ejected from any part of its circumference. These *pseudo-podia* can be protruded from any part of the surface, and

can be again retracted; at the will of the animal. The only organs present in these animals is the *nucleus*, a dark, solid, refractive body, whose function is unknown; the *contractile vesicles*, which are spaces filled with fluid, and pulsate rhythmically; and other spaces called *food vacuoles*.

Reproduction takes place either by fission; or a single *pseudopodia* separates and becomes a fresh *amœba*; or by the separation of a little mass of *sarcode* from the interior, the animal having become quiescent, and the nucleus and contractile vesicles disappearing. These little masses develop themselves into ordinary *amœbæ*.

PROTOCOCCUS (Gr. first-grain), a genus of *Palmellaceæ* (q. v.), to which Red Snow (q. v.) is commonly referred.—Another species is *P. phuvialis*, not unfrequent in stagnating rain-water. It passes through various stages of growth, in which it has been described under various generic and specific names. In some of its stages, in which it moves by means of two long cilia, it has often been mistaken for an animalcule. Its color is usually green, but sometimes red; and the red matter often appears as a mere central nucleus, which has been mistaken for the eye of the animalcule. In its ordinary form, it consists of a mass of colorless *protoplasm* (see CELLS), with red or green granules diffused in it, surrounded by a *primordial utricle* (see CELLS), and undergoing division into halves, which are soon surrounded by separate envelopes, and undergo division again; the new cells thus formed, and they are formed with great rapidity, being sometimes set free by the dissolution of the original enveloping membrane, more frequently remaining imbedded in a gelatinous substance formed from it. The new cells often send forth two vibratile filaments or cilia, which spring almost from one point, often a kind of beak; and move with considerable rapidity; and in this state also, they multiply by binary subdivision; or they rest, become *encysted*, and divide into four. If slowly dried, the *P. phuvialis* retains life, and resumes its functions when again moistened.

PROTOCOL (Gr. *protos*, first, and *kolla*, glue), a word used in two senses: 1. The rough draft of an instrument or transaction; and more particularly the original copy of a government dispatch, treaty, or other document. 2. A record or register. In Scotland, every notary, on admission to office, formerly received from the Clerk-register a book called his protocol, in which he was directed to insert copies of all the instruments which he might have occasion to execute, to be preserved as in a record. At one time, these protocols were attempted to be made available as records of sines, but many causes operated to prevent their being thus used; they have, however, often been found serviceable, when regularly kept, to supply the loss of a missing deed.

PROTOGNE (Gr. first-born), a granitic rock, composed of the same ingredients as true granite, except that the mica is replaced by talc. It received its name because it was supposed to have been the *first-formed* granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china.

PROTOGENES, a celebrated painter of ancient Greece, was born at Kaunos in Caria, and practised his art at Rhodes. Very little is known concerning him, except that he was a contemporary of Apelles, who was the means (see APELLES) of first drawing the attention of the Rhodians to his extraordinary merits. Pliny says that when Demetrios Poliorketes was endeavoring to conquer Rhodes, he took the utmost precautions to prevent any injury from happening to the studio of P., who then lived in a little cottage (*casula*) on the outskirts of the city, and even stole away at times from the turmoils of the siege to visit the painter, quietly and earnestly pursuing his work amid 'the din of arms and the thunder of the battering-engines.' P. died about 300 B.C. He was a careful and elaborate painter, sparing no pains to secure a brilliant, natural, and finished piece of workmanship; and was apparently held in the highest estimation by the ancients. Cicero says that his pictures were perfect in every respect. The principal were 'A Satyr resting and holding his Pipes,' 'The *Paralos* and *Ammonias*' (or sacred ships of the Athenians, executed for the Propylææ at Athens); and 'The Thesmœthetæ' (for the Athenian Senate-house of the Five Hundred).

PROTO-NOTARY (Gr. *protos*, first, and Lat. *notarius*, notary), the name given to a notary appointed by the Holy See. Among the officials of the court of Rome, is a body, twelve in number, called the College of Notaries, who are to be distinguished from honorary or extraordinary apostolic notaries. The former are said to date from a very early time, and are charged with the official registration of all the solemn acts of the pope, whence they have a very special duty in relation to canonization of saints, &c. Their number was fixed by Sixtus V. at twelve, and they enjoy many privileges. An apostolic notary-extraordinary, although called proto-notary, does not enjoy the same privileges. The proto-notary extraordinary may be named not only by the

pope, but also by a LEGATE (q. v.), and under certain restrictions, by the Roman College of Notaries.

PRO'TOPHYTES (*Protophyta*, Gr. first plants), a name now frequently employed to designate the lowest or simplest organisms in the vegetable kingdom, corresponding to the *Protozoa* of the animal kingdom. They are regarded as among the *Algae* (q. v.). Many of them are mere simple cells, which multiply by division, although perhaps they may yet be found to have also another mode of reproduction; others consist of cells united by a gelatinous substance, and the aggregate in some is a shapeless mass; in others, a plant-like structure, the form resulting from the mode in which the division of cells takes place. In none of them do the cells assume determinate characters in any part of the structure, so as to constitute different organs; in which they differ from all higher plants. It is sometimes very difficult to distinguish P. from *Protozoa*; and perhaps the surest distinctive character is the nature of their food. Some of the *Protozoa*, having no mouth, as the *Proteus* or *Amaba*, might be regarded as plants rather than animals; but they subsist by consuming organic particles, vegetable or animal, whilst P. live by appropriating inorganic substances, chiefly from the air or water around them. Among the P. are the *Palmellaceæ* (q. v.).

PRO'TOPLASM. See CELLS.

PROTOZO'A (Gr. *proton*, first, and *zōon*, animal), constitute the lowest animal subkingdom, and include a large number of animal beings of the lowest and simplest type of organization. Their bodies consist either of a simple cell or of an aggregation of cells, each of which seems to retain its independent existence. In none of the P. can a nervous system, or organs of sense, be detected; and except in one group (the *Infusoria*), there is no trace of a mouth. Excepting the sponges, they are generally of very minute size, and only to be observed with the microscope; and excepting a few that inhabit the bodies of other animals, all are aquatic animals. They generally present the appearance of a transparent gelatinous cell, containing a nucleus; in addition to which, one or more clear pulsating spaces, termed *contractile vesicles*, may be frequently seen. Excepting the infusoria, none present true reproductive organs, reproduction being usually accomplished by fissure. They may be divided into the following groups or classes: (1) *Monera*, (2) *Rhizopoda*, (3) *Foraminifera*, (4) *Stelozoa*, (5) *Radiolaria*, (6) *Infusoria*, (7) *Gregarinida* (see these articles). The sponges formerly, as *Spongia*, ranked amongst the P., are now usually made an independent division and called *Porifera* (see ZOOLOGY).

PROUD-FLESH is the popular term for coarse and too luxuriant granulations (q. v.) springing up on wounds or ulcerated surfaces. Such granulations must be treated with nitrate of silver or sulphate of copper, either in the solid form or in strong solution.

PROUDHON, PIERRE JOSEPH, a noted French publicist and speculator on social and political subjects, was born July 15, 1809, at Besançon, in which town his father was a poor cooper. Through the good offices of charitable friends, he received the rudiments of his education at the college of his native place, and from the first gave great promise of talent. While still very young, however, he quitted the institution in order to aid his family, which had fallen into great distress, and sought employment in a printing establishment. Here he was noted for the most punctual discharge of duty; and in the hours not occupied in work, he contrived, by a rare exercise of resolution, to complete and extend his education. In 1830, he declined an offer of the editorship of a ministerial journal, preferring an honorable independence as a workman, to the career of a writer pledged to the support of authority. He became a partner in 1837 with MM. Lambert and Maurice in the development of a new typographical process; was engaged on an edition of the Bible, to which he contributed notes on the principles of the Hebrew language; and in 1838, published an *Essai de Grammaire Générale*; in approval of which, a triennial pension of 1500 francs was awarded to him by the Académie de Besançon. On this accession of funds, he paid a visit to Paris; and subsequently contributed to the *Encyclopédie Catholique* of M. Parent Desbarres the articles *Apostasie*, *Apocalypse*, and others. In 1840, he issued the work entitled *Qu'est-ce que la Propriété?* which afterwards became so famous. The nature of the doctrine announced in it is sufficiently indicated in its bold paradox, soon to be widely popularized—*La Propriété, c'est le Vol*. At the moment, it attracted little notice; and the sole results to its author were the withdrawal of his pension by the Academy, on the score of his noxious opinions, and the threat of a prosecution, which, however, was departed from, at the instance of M. Blanqui, the political economist, to whom reference in the matter was made. In 1842, for a repetition of offence in his *Avertissement aux Propriétaires*, he actually was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1843 to 1847, P. was employed at Lyon, under

MM. Gauthier, in the superintendence of a scheme of water-transport on the rivers Saône and Rhône; publishing during this time at Paris the two works entitled *De la Création de l'Ordre dans l'Humanité* and *Système des Contradictions Économiques*.

With the outburst of the Revolution of February 1848, the opportunity of P. had arrived. He instantly repaired to Paris, and on the 1st of April, he came before the public as editor of the *Représentant du Peuple*, instantly, by his fierce and vigorous advocacy of extreme democratic and socialistic opinions, making his mark as a leading figure of the hour. His paper was suppressed in August following; but meantime, on June 4, no less than 77,094 enthusiastic admirers had voted him into the Constituent Assembly as representative of the department of the Seine. His career as senator, if brief, brought him at least notoriety. *La Propriété, c'est le Vol*, though a maxim much commending itself to the moral sense of the hungry masses, naturally failed to find like acceptance with an audience mostly with some sous in the pocket. P. soon ceased to address the Assembly, for, so soon as he ascended the tribune, the indignant roar which saluted him rendered audible speech impossible. Under these circumstances, P. once more betook himself to his pen, and, as editor of three daily journals in succession, avenged himself on the adversaries who declined *viâ voce* to listen to him, the chief victims of his savage personalities being MM. Ledru Rollin, De Lamartine, Louis Blanc, Considerant, Cavaignac, &c. All three papers—*Le Peuple* (November 23, 1848—April 1849), *La Voix du Peuple* (October 1849—May 1850), *Le Peuple* de 1850 (June 15—October 18)—were in turn suppressed as anarchic and obnoxious. During their continuance, he was repeatedly subjected to fines, which were defrayed for him by popular subscription.

In January 1849, he attempted a reduction of his theories to practice by the institution of a *Banque du Peuple*. This project, which had for its object *la suppression du capital*, speedily experienced at the hands of 'capital' the fate it had intended to inflict. The bank was closed by authority, and its originator fled to Geneva, to escape threatened imprisonment. In June, however, he returned, and his next three years were passed in the prison of St. Pelagie. While shut up there, he married. During his imprisonment, he gave to the world the works entitled *Confessions d'un Révolutionnaire* (1849), *Actes de la Révolution* (1849), *Gratuité du Crédit* (1850), and *La Révolution Sociale démontrée par le Coup d'Etat* (1852); the last of which is remarkable, in the light of subsequent events, for the clearness with which it states the alternative of *l'anarchie* ou *le Césarisme*, as pressed on Louis Napoleon, then president. In June 1852, he was set at liberty; and quitting Paris, no longer a desirable abode for such unquiet spirits, went to Belgium, where he continued to publish from time to time on his favorite subjects of speculation. He died in obscurity at Paris, January 19, 1865.

Monstrous as are the social theories with which, in the history of his time, the name of P. remains connected, his power as a writer is not to be denied. It may be questioned how far he was at any time the dupe of his own paradoxes, or blind to the utter insufficiency of the premises from which, with a show of scientific rigor, he evolved his portentous results. It is related that in the negotiation of his marriage, he was very sharply solicitous as to the disposal of certain property possessed by the lady; and that on her notary venturing some surprised allusions to the famous *La Propriété, c'est le Vol*, the philosopher gravely replied: 'Be pleased, my dear sir, on such an occasion as the present, to be, if possible, a little serious.'

PROUT, SAMUEL, painter in water-colors, was born at Plymouth in 1788. He evinced a strong love for nature at an early age. Mr. Britton, when about to collect materials for his *Beauties of England and Wales*, engaged his professional aid; and his drawings made for Britton's works attracted so much notice in London, that he was induced to take up his residence in that city. In 1818, having been advised, on account of his health, which had always been delicate, to try a change of air, he went to Rouen by Havre; and the picturesque street-architecture and fine Gothic remains there made so strong an impression on his mind, that afterwards, his principal works were those in which architecture had a prominent place; and from time to time, in his after-career, he made excursions, ransacking every corner of France, Germany, the Netherlands, and Italy, for picturesque architectural remains. P.'s name is dear to all the artists and amateurs of this generation, for there are few who have not been incited or instructed by his numerous elementary drawing-books, in the slightest of which, talent and feeling for art are conspicuous. His water-color drawings are characterized by decision in handling, great breadth, and clear and pleasing coloring; good specimens are highly valued. He died at Camberwell on February 9, 1852. His character was amiable, and he was highly respected by his professional brethren.

PROVENCE, formerly a maritime province of France, in the extreme south-east of the country, was bounded on the S. by the

Mediterranean, and comprised the modern departments of Bouches du Rhone, Var, Basses-Alps, and the east part of Vaucluse. It included a portion of the territory belonging to the Roman province of Gaul generally called simply *Provincia* ('the Province'), whence it derived its name.

PROVERBS (Lat. *proverbium*, a common saying or word, Gr. *paroimia*, a way-side saying, corresponding to Eng. byword) are pithy, practical, popular sayings, expressive of certain more or less general convictions. The definitions of the proverb are almost as numerous as its own varieties of form. Aristotle speaks of them as 'remnants, which, on account of their shortness and correctness, have been saved out of the wreck and ruins of ancient philosophy.' Agricola considers them 'short sentences, into which, as in rules, the ancients have compressed life.' Erasmus holds them to be 'well-known and well-used dicta, framed in a somewhat out-of-the-way form or fashion.' Cervantes explains them as 'short sentences drawn from long experience.' Johnson talks of them as 'short sentences frequently repeated by the people.' Less definitions of, than general opinions on the proverbs, are sayings like that of Howell, that 'sense, shortness, and salt' form their component parts. They are 'the genius, wit, and spirit of a nation,' according to Bacon. 'The wisdom of many, and the wit of one,' according to Earl Russell. In them, it has been said, is to be found an inexhaustible source of precious documents in regard to the interior history, the manners, the opinions, the beliefs, the customs of the people; and their use has been strikingly pointed out by George Herbert, who entitled his collection of proverbs *Jacula Prudentium* (Darts or Javelins of the Wise), a term probably derived from Plato's *Protagoras*.

Yet there have, on the other hand, not been wanting those who, like Lord Chesterfield, have deprecated their use in polite society, on account of their occasional vulgarity, and recommended stilted sentences à la Larochefoucauld instead. Of these solitary voices, however, no more notice was ever taken than they deserve. From the earliest historical times, proverbs have been household words, not merely among the people at large, but among the greatest and wisest of men. The prodigious amount of sound wisdom and good common sense they contain, the spirit of justice and kindness they breathe, their prudential rules for every stage and rank, their poetry, bold imagery and passion, their wit and satire, and a thousand other qualities, have, by universal consent, made them the most favorite mode of imparting hints, counsels, and warnings.

Being emphatically sayings originated within or commonly adopted by the people, and handed down, in most cases, from the remotest antiquity, the question as to their origin and age is an exceedingly difficult one. Some of their sources have been pointed out in the responses of oracles, in the allegorical symbols of Pythagoras, in the verses of the ancient poets, in mythological tales, in historical events to which they allude. That they existed to a great extent before the times of which written records have reached us, is clear from the number of them which lie imbedded—as a kind of well-known quotations—in these records themselves; and what tends still further to increase the difficulty of giving them a kind of fixed habitation within a certain country or age, is the circumstance that the same proverbs are found, as it were, among all nations and at all ages. From the East they were for the most part imported into Hellas, thence to Rome, and from thence they were scattered all over Europe, and partly brought back again, slightly altered, to the East. Even certain Jewish proverbs quoted by Christ and the apostles, which hitherto did not seem to offer any analogy in other languages, might be traced back to India, where they had existed for many long centuries before they found their way into the popular speech of Palestine and Babylonia, and thence into the Talmud. That the names of their authors should, as a rule, be lost, is not surprising; yet we do meet with single instances in which either the author of a proverb is well known, or others whose nationality and birthplace are easily recognized. In the former case, it is generally some memorable event in a celebrated man's life which is remembered in close connection with a certain striking sentence he then uttered. In the latter, the scenery, the circumstances, the history of a special country, may so unmistakably be pointed, that they leave no room for any doubts on the birthplace of the special proverb; and more than that, even the special period which gave it birth, may be recognized by some trace of its character, manners, fashions, and occupations.

'What is nearest and dearest to the heart of a nation, the aspect under which they contemplate life, how honor and dishonor are distributed among them, what is of good or of evil report in their eyes,' as a recent writer has it, will surely be apparent in their national proverbs. Thus, for instance, the Greek proverbs may be designated as being fraught with a thorough knowledge of their own mythology, poetry, and history, bearing testimony to the high intellectual training that ran through all classes. The Roman ones—fewer in number, as far as they are the genuine

growth of their own soil—have much less poetry about them, and are also deficient in the refinement and delicacy which were indigenous to Hellas. On the other hand, the character of the people comes well out in the constantly reiterated lessons of frugality, patience, perseverance, independence they inculcate; the practical hints as to marriage, education; and the various pursuits of the busy, vigorous, energetic nation—and among which agriculture played a prominent part. Of the proverbs now in use among European nations—calculated at about 20,000—the Spaniards are supposed to have a very large, if not the largest proportion. They may be recognized by a certain *grandezza*, a stateliness and thoughtfulness, blended though they be with humor and irony; and by the spirit of chivalry, honor, and freedom with which they are filled. The Italian proverbs, which come next as to quantity, are, to a certain extent, replete with a certain shrewdness and selfishness; and while they are fraught with unbridled passion, teach doctrines of cynicism and general distrust; yet, on the other hand, there are many of the noblest stamp, of a delicate refinement of beauty, of a subtle wisdom, teaching honor and honesty, plain-dealing and uprightness. In the same way, the French, the German, the English, as well as the Chinese and the Hindus, and every nation under the sun, impart a certain distinctive type and stamp to their homely sayings, which tells a distinct tale respecting their own inner life and national peculiarities. Of the Scotch proverbs, of which Kelly collected 3900, it has been said that there is a shrewdness, although deficient in delicacy, about them; that they are 'idiomatic, facetious, and strike home.'

Of the general utility of the proverb, it is needless to speak, after what we have said; we will only adduce the well-known frequent use made of them for ethical purposes in Scripture, which contains an entire book of them, ascribed, for the greater part, to the Wise King himself; in the Midrash and Talmud, which contains, likewise, a whole collection of pithy sayings of the 'Fathers,' or Mishnaic teachers, and out of which several later collections have been compiled; in the patristic and later theological writers, who like Luther, drew very largely upon these popular treasures.

Erasmus lays claim to be the first modern collector of proverbs, although Polydore Vergil, and not without a certain amount of truth, accuses him of plagiarism. His *Adagia* (Par. 1500) fired the learned in Europe with a desire to collect and to publish proverbs of their own countries. F. Nunez and the Marquis of Santellana edited Spanish *Refranicos*; Florio, an Italian, *Giardino di Ricreazione* (1591); which was followed by the Italian collections of Angelus Monozini and Julius Varini. Ondin published French proverbs as *Curiosités Françaises*. The first real German (Nether-Saxon) collection is due to Johann Agricola, whose *Gemeine Sprichwörter* appeared in 1528. In England, Camden, Herbert, Howell, Fuller, Ray, Kelly, Bohn, and others; in Germany, Weber, Sailer, Nopitzsch, &c., have issued national collections. Freytag and Burkhardt published *Arabic Proverbs*; Dukes, a small collection of Neo-Hebrew proverbs, &c. Thus, it may easily be seen, there is by no means a lack of material; and yet very little has been done towards the investigation and elucidation of the numerous points of interest connected with this subject. Disraeli's *Curiosities of Literature* contain a valuable essay on the 'Philosophy of Proverbs,' from which (as also from Eiselein's *Sprichwörter und Sinnreden*, 1840) Archbishop Trench has derived a great deal of information for his excellent little book, *On the Lessons in Proverbs*. Freytag's introduction to his collection of *Arabic Proverbs*, and that of Le Roux de Lincy to his French collection, make honorable exceptions to the general run of vapid prefaces to most modern collections.

PROVERBS, THE BOOK OF (Heb. *Mishle*, LXX. *Paroimia Salomontos*, Vulg. *Proverbia*), a canonical book of the Old Testament, containing an anthology of gnomes and sentences, the fruit of reflections on the Mosaic law and on the divine guidance of the people of the Israelites. It is also called the 'Book of Wisdom,' in as much as it embraces the doctrines of the old covenant crystallized into religious maxims of thought, will, and action. Practical piety is enjoined under the name of 'Life,' while 'Death' represents sin throughout. The form of these proverbs is manifold—similes, enigmas, theses and antitheses, wise sayings, gnomes, comparisons, &c., very constantly. The book is divided into three sections, to which the two last chapters form an appendix. The first sections (chaps.—i. ix.) contains a description and a recommendation of Wisdom as the highest good obtainable, and is further subdivided into three portions. The second (x.—xxiv. 34) is equally in three portions, in the first of which the sentences are very loosely strung together; while, in the second, they are joined into more continuous utterances, sometimes running through several verses; and the third, which has the inscription: 'These, too, are of the wise men,' contains, again, some single sentences, principally in the form of commandments and prohibitions. The third section (xxv.—xxix.) is inscribed: 'These are

also proverbs of Solomon, which the men of Hezekiah king of Judah copied out,' and is somewhat different from the former by the more predominant form of theses and antitheses, catch-words by which an association of ideas is produced, and similes. The first chapter appended (xxx.) contains the proverbs of Agur, which, in a very artificial garb, teach the true wisdom and its practice in life; the second (xxxi.), inscribed: 'Words of King Lemuel, the prophecy that his mother taught him,' contains from verses 1—9 wise maxims for a king and chastity and temperance, and from 10—31, the praise and properties of a good wife, in the form of an alphabetical song.

Tradition has ascribed the authorship of this book to Solomon, 'the wisest of men;' but although neither the language, nor the structure, nor—as has principally been urged—the contents, are of a nature to convince us of the absolute necessity of assuming various authors and various epochs, there is no doubt a strong presumption in favor of this hypothesis. Who the Agur was that is mentioned as the author of the last chapter but one, is not easily conjectured. Equally unsatisfactory are the results of the speculations about the reputed author of the last chapter, Lemuel, by some supposed to be the brother of Agur. Probably it is nothing more than a symbolical name. The last section (xxxi. 10—31)—an alphabetical acrostic—probably belongs to the 7th c. B.C., and by its language and form, does not appear to belong to the author of the preceding part of the chapter. The nucleus of the book is formed by the second section (x.—xxii. 16), to which the first (i.—ix.) was added by way of introduction, and the third as the concluding portion. Whether that first anthology (from the 3000 proverbs of Solomon mentioned 1 Kings, iv. 32) was collected and redacted (into section two) during Solomon's lifetime, is very doubtful; so much, however, is certain, that the learned men at the time of Hezekiah undertook their additional collection with a view to a then already-existing portion. It may not be superfluous to add, that Jerome, misled by 1 Kings, iv. 32, erroneously states our Book of Proverbs to contain the 3000 proverbs there ascribed to Solomon. The canonicity of the book is matter of controversy in the Talmud; there seems to have been at one time an objection to receive it among the number of sacred books, on account of certain contradictions contained in it; this objection, however, was overruled, and it occurs in the order of the Hagiographa (Kethubim) of the Masoretic Code, generally between Job and Ecclesiastes. The order followed in the Authorized Version had been adopted already in the time of Jerome.—Principal writers on P. are Ewald, Bertheau, Hitzig, Elster, Rosenmüller, Hirzel, Umbreit, M. Stuart, and Dr. Noyes.

PROVIDENCE, a city, semi-capital, and seaport of the state of Rhode Island, U.S., situated at the head of navigation, on an arm of Narraganset Bay, known as Providence River 35 miles from the ocean, 43 miles S.S.W. from Boston, and 160 N.E. of New York. It is the second city in New England, covering nearly 15 sq. miles on both sides of the river, which, above its two bridges, expands into a cove, a mile in circuit, on the borders of which is a handsome park, shaded with elms. It is a city of large commerce, manufactures, and wealth, abounding with beautiful villas and gardens. Two small rivers afford water-power to extensive manufacturing establishments. There are 10 daily and other papers, the oldest of which was established in 1763; 76 churches, among them the oldest Baptist church in America, established in 1638 by Roger Williams; hospitals and asylums; a state prison, which had, in 1874, 67 convicts, making cabinet-work and shoes, and earning 3000 dollars a year over their expenses. Among its institutions are: Brown University; an Athenæum, with a library of 34,000 volumes; a liberally-endowed college of the Society of Friends; a Roman Catholic Institute; Franklin Lyceum; 4 grades of free schools; 45 banks; 20 insurance companies; 10 railroads, all but two uniting in one central station; several lines of steam-boats; 60 cotton factories, 25 woollen; numerous iron-works; several bleaching and calendering mills; 5 large screw-mills, making 6000 tons a year; and 150 manufactories of gold and silver ware and jewelry. P. was settled in 1636, by a colony of refugees from Mass. under Roger Williams. Pop. (1875) 100,675; (1880) 104,857.

PROVINCIAL OF AN ORDER is the superior of all the houses, and all the members of a monastic order, within any particular province. The office is generally held for a stated term of years, and in most orders the appointment to it rests with the General (q. v.).

PROVINS, an old town of France, in the department of Seine-et-Marne, 59 miles E.S.E. of Paris, occupies a valley irrigated by two streams, the Darten and the Voulzie, whose waters are employed to turn 50 or 60 corn-mills in the district. It is surrounded by ancient walls, flanked by ruined watch-towers, and is divided into the high and low towns. In the former, is an ancient tower built during the middle ages, but vulgarly called the *Tour de César*. The vicinity was long famous for its roses, still cultivated to a considerable extent. Pop. (1876) 7176.

PROVISION (Lat. *provisio*, from *providere*, to provide), in Church Law, means the bestowing an ecclesiastical benefice, and involves two stages—the designation of the person on whom it is bestowed, and the actual collation (Lat. *collatio*) of the benefice, which is completed by his taking possession. Both these acts fall properly to the ecclesiastical authority; but by usage of a very early date, the state, and often individuals, are admitted to a share in the provision of ecclesiastical benefices. In the medieval church, the claim of the sovereign to the provision of vacant bishoprics, was often the subject of contention with the popes (see INVESTITURE), but at all times the right of final and complete provision was admitted to belong to the pope. In later times, this claim has commonly been regulated by concordat. In most Roman Catholic countries, the crown elects to bishoprics, and the pope is bound to confirm the nominee of the crown, unless canonical cause of rejection should appear. In the Russo-Greek Church, the candidates are presented by the Holy Synod, and the czar names the bishop from among them. In Protestant countries, the election to benefices and dignities in the Roman Catholic Church is generally by the chapters; but in some of them, as in Holland, Prussia, Hanover, a qualified veto is permitted to the crown. In the Church of England, the bishop is nominally elected by the chapter; but, in reality, the members of the chapter are only permitted to name the particular person whom the crown presents to them for election with the *congé d'élire*. In the Roman Catholic Church of England and of Ireland, the parochial clergy, together with the canons, recommend three candidates, one of whom is commonly, although not necessarily, appointed by the pope. The conditions and usages of provision to parochial and other benefices, have been explained under the head INSTITUTION (q. v.). The completing act of provision is the installing in possession, which is described under the head INDUCTION (q. v.).

PROVINCIAL ORDER is an order granted under the powers conferred by an act of parliament, by a department of the government, by the Secretary of State, or by some other authority, whereby certain things are authorized to be done, which could be accomplished otherwise only by an act of parliament. The order does not receive effect, however, until it has been confirmed by the legislature. Till that time, it is purely provisional; and even after it has been so confirmed, and is in reality an independent act, it retains the title of a provisional order.

Provisional orders have been in operation in England for many years, and have been found most useful in facilitating the modification or extension of the provisions of general acts, so as to adapt them to the special necessities of particular districts. A general statute, dealing with an extensive subject like police or sanitary improvement, could only embrace provisions suited to the requirements of the country generally, and could not be so framed as to meet exceptional circumstances. When these had to be provided for, private legislation was necessary; but the cost and delay attendant upon the promotion of local acts in the usual way were so great as in many cases to be practically prohibitory. What was needed, therefore, was a ready and inexpensive mode of obtaining local legislation, and the system of provisional orders was devised to meet that want. The general act embodied legislation generally applicable, and gave power to some board or officer to issue provisional orders, whereby the general act might be better applied to special districts or under peculiar circumstances. Such powers were by the Public Health Act, 1858 (11 and 12 Vict. c. 63), conferred on the General Board of Health thereby constituted, but were by the Local Government Act, 1858 (21 and 22 Vict. c. 98), transferred to the Secretary of State.

The Turnpike Trusts Act, 1851 (14 and 15 Vict. c. 88), empowered the same functionary to grant orders in reference to the objects of that act; while the Piers and Harbors Act, 1861 (24 and 25 Vict. c. 45), authorized the Board of Trade, with the sanction, in certain cases, of the Admiralty and Commissioners of Woods and Forests, to issue provisional orders dealing with a variety of important matters connected with the construction of piers and harbors, and the levying of dues and rates. The Lands Drainage Act, 1861 (24 and 25 Vict. c. 133), gave power to the Enclosure Commissioners to issue orders for the purposes specified in that act; and the Merchant Shipping Amendment Act, 1862, gave, relatively to its objects, corresponding powers to the Board of Trade.

All these acts were in full and beneficial operation in England when the General Police and Improvement (Scotland) Act, 1862 (25 and 26 Vict. c. 101), was passed, and it conferred extensive powers on the Secretary of State in relation to the granting of provisional orders for police and sanitary purposes. Subsequently, the Irish Drainage and Improvement of Lands Acts of 1863 and 1864 (26 and 27 Vict. c. 88, and 27 and 28 Vict. c. 72), enabled the Commissioners of Public Works, and the Oyster and Mussel Fisheries Act, 1866 (29 and 30 Vict. c. 85), enabled the Board of Trade, to issue orders in relation to the subjects of these acts respectively.

Nothing can be more diversified than the objects to be attained by provisional orders under the several acts above alluded to, and yet the course of procedure in relation to them all is substantially the same. A petition to the proper authority, specifying what is wanted, and supported by such evidence as can accompany the application, is made the subject of inquiry by a qualified person commissioned for the purpose. After due inquiry has been made, and the result has been reported to the authority to which the application is addressed, the petition is disposed of, either by giving or refusing what is asked, or by giving it in a modified form.

When a provisional order is granted, steps are taken on behalf of the government to have it confirmed by parliament. In the case of orders issued under the General Police and Improvement (Scotland) Act, for example, the requisite Confirmation Bill is framed, under instructions from the Secretary of State, by the Lord Advocate, who takes charge of the measure through its various stages. When unopposed in parliament, ten days or a fortnight usually suffice for the passing of the requisite Confirmatory Act, which has all the facilities of a government measure. Of course, the whole expense connected with the preparation and passing of the order, and the relative Confirmation Act, is defrayed by the applicants; but the advantages of provisional orders, compared with ordinary private bills, are nevertheless considerable. A provisional order may be got with greater expedition and at much less cost than a private bill. It is exempted from the tedious and costly formalities of complying with standing orders and making deposits, with all the formidable fees of the House, and other incidental charges. When opposition is offered, the opponents are fully heard by the commissioner appointed to make the requisite inquiries; and the grounds of opposition are deliberately weighed, first by him, and afterwards by the superior authority to whom he makes his report. The opponents have thus the satisfaction of knowing that their case has been considered, with probably the same result as if it had been submitted at much cost to a parliamentary committee. There is, therefore, little inducement in ordinary circumstances to appeal directly to the legislature; and, as a consequence probably, an opposition to a provisional order in parliament is exceedingly rare. No doubt, if an opposition on feasible grounds were offered to a provisional order in parliament, the whole subject would be referred to a select committee, who would probably proceed as in the case of an opposed private bill; but that, as has been observed, is of so rare occurrence, that it does not detract from what has been said in regard to the advantages of the system as a rule.

PROVISORS, STATUTE OF. The object of this statute, 25 Edward III. st. 6, was to correct, and put an end to, the abuses which had arisen in the exercise of the papal prerogatives as to the disposal of benefices in England. See **BISHOP; PATRONAGE.**

PROVOST (Lat. *propositus*, set over), in Church Law, the chief dignitary of a cathedral or collegiate church, from which use the title has also been transferred to the heads of other similar bodies, whether religious, literary, or administrative. Properly, however, the name is given to the highest dignitary in the metropolitan or diocesan chapter, and is often held conjointly with the archdeaconry. The provost is next in dignity after the archbishop or bishop, a position which is also the right of a provost of a collegiate chapter. The name is also given to the superiors of certain religious houses of lesser rank, and the relation of which to the more important houses is analogous to that of the priory to the abbey. It was also given to certain lay officials, whose duties, in relation to the church and maintenance of its material condition, were similar to those of the modern churchwarden. In the Protestant Church in Germany, the name provost is sometimes used as synonymous with that of dean or arch-priest; and occasionally, where several minor churches or chapels are attached to one chief church, the minister of the latter is called 'provost.'

In England, the heads of several colleges in the university of Oxford, and the head of King's College, Cambridge, are designed provost. The head of Eton College is also so called. The Provost of the Mint is a judge appointed to apprehend and prosecute false coiners.

In Scotland, the chief municipal magistrate of a city or burgh is called Provost, the term corresponding to the English word mayor. The provost presides in the civic courts along with the bailies, who are his deputies. The chief magistrates of Edinburgh and Glasgow are styled Lord Provost, and the claims of the Provosts of Aberdeen and Perth to the designation of Lord, although at one time contested, are now held to be fully established. The right to this distinction does not seem to depend on anything peculiar in the nature of the constitution of these municipalities, but on its being expressly conferred by the crown, or sanctioned by royal usage. The Lord Provost of Edinburgh is entitled to the prefix 'Right Honorable,' which may be attached not merely to the name of his office, but to his Christian name and surname, a

usage which probably originated in the circumstance, that the Lord Provost of Edinburgh was *ex officio* a member of the old Scots Privy Council. Within the city and liberties of Edinburgh, the Lord Provost takes precedence next after members of the royal family. The Lord Provost of Glasgow is generally styled the 'Honorable,' a prefix, however, which belongs only to his office, and cannot be attached to his name.

In France there were formerly various descriptions of inferior judges, known under the name of provost (*prévôt*). The Grand Provost of France had jurisdiction in the king's house and over its officers.

PROVOST-MARSHAL, in the *Navy*, is a person appointed to have charge of a prisoner before a court-marshal, and until the sentence of the court is carried into execution. In the *Army*, the provost-marshal is an officer, with the rank of captain, appointed to superintend the preservation of order, and to be, as it were, the head of the police of any particular camp or district. He has cognizance of all camp-followers, as well as of members of the army. His power is summary, and he can punish an offender, taken *flagrante delicto*, on the spot, according to the penalties laid down in the Mutiny Act.

PROW (from the Latin *prova*) means, generally, the fore-part of a ship, or more especially the beak or pointed cut-water of a galley, polacre, or xebec.

PROXY (contracted for Procuracy), the agency of one person who acts as substitute for another. Every member of the House of Lords can (by license, in theory supposed to be obtained from the sovereign) appoint another Lord of Parliament his proxy to vote for him in his absence. A spiritual lord can, however, only be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer can hold more than two proxies at the same time. Proxies cannot be used in judicial cases, or where the House is in committee, nor can a proxy sign a protest.

PRUDENTIUS, AURELIUS CLEMENS, a Christian poet of the 4th c., was a native of Spain, and was born 348 A.D. Nothing is known regarding him except what he has himself told in a poetical autobiography prefixed to his works. From this we learn that he received a liberal education, was admitted to the Roman bar, practised as a pleader, discharged the functions of civil and criminal judge, and was ultimately appointed to a high office at the imperial court. The year of his death is not known. In his youth, P. was fond of pleasure, and very dissipated; but as he grew old, he became very devout, and his writings (which are all in Latin verse) reflect the latter phase of his character. The principal are—1. *Cathemerinon Liber* (Book [i. e., of hymns] for Daily Use), being a series of twelve hymns, the first half of which were reckoned by the author suitable for devotional purposes at different parts of the day; 2. *Apotheosis* (a defence of the doctrine of the Trinity against heretics); 3. *Hamartigenia* (On the Origin of Evil, a polemic, in verse, against the Marcionites); 4. *Psychomachia* (The Triumph of the Christian Graces in the Soul of a Believer); 5. *Contra Symmachum, Liber 1* (a polemic against the heathen gods); 6. *Contra Symmachum, Liber 2* (a polemic against a petition of Symmachus for the restoration of the altar and statue of Victory cast down by Gratian); 7. *Peri Stephanon Liber* (14 poems in praise of Spanish and other martyrs for the faith); 8. *Diptychon* (48 poems of four verses each, on Scriptural incidents and personages). Bentley calls P. 'the Horace and Virgil of the Christians,' which may be true enough if the critic only meant to say that P. is the first of the early Christian verse-makers; but is ridiculous if he intended to hint at a comparison with these two masters of poetic elegance and grace.

PRUD'HOMMES, COUNCIL OF (from Latin *homo prudens*), municipal tribunals, which existed first in the middle ages at Marseille, Lyon, and perhaps elsewhere in France, exercising an equitable jurisdiction as arbiters of disputes between masters and workmen. Similar tribunals, under the same name, were reintroduced by Napoleon I. in 1806, and have been found of great practical utility. They now exist—or recently existed—in Lyon and Paris. They were instituted in the former town in 1806, in favor of the silk-trade and other trades immediately connected with it. The council consists of manufacturers, mercers, master-workmen, foremen, dyers, and common workmen, elected among themselves. The council is empowered to dispose finally of all differences between manufacturers and their workmen, or between master-workmen, companions, and apprentices, where the sum in dispute does not exceed 200 francs; and it may also take cognizance, subject to an appeal to the Tribunal of Commerce or Tribunal of First Instance, of similar disputes, whatever their amount. Other functions of a miscellaneous nature belong to the Council of Prud'hommes, including the inspection of the workshops, in order to obtain information regarding the number of looms and of workmen, and the giving an opinion, when required by the administrative authorities, on any question submitted to it. In 1844, a Council of Prud'hommes was established in Paris in

favor of the metal trade, and all trades connected with it; and three new councils of the same kind were instituted in Paris in 1847—one connected with the manufacture of tissues of all kinds, another with the manufacture of chemicals, and a third having jurisdiction in all other trades.

PRUNELLA, a genus of plants of the natural order *Labiata*, having the upper lip of the calyx 3-toothed, the lower lip bifid; the upper lip of the corolla arched and nearly entire; the lower lip 3-lobed; and four filaments, each with two teeth at the extremity, of which one bears the anther. Several species are natives of Europe; one only is found in Britain, *P. vulgaris*, popularly known as **SELF-HEAL**, a plant very frequent in moist and barren pastures, as it is also throughout most parts of Europe, Central Asia, North America, and New Holland. It has oblong-ovate stalked leaves, and violet-blue flowers, very densely whorled, so as to form an imbricated oblong spike. It was at one time in considerable repute as febrifuge. It is mildly aromatic and slightly astringent.

PRUNES are dried fruit of the plum-tree (*Prunus domestica*), of the variety called *Juliana*, which is so largely cultivated in France, that not only is that country supplied, but Britain also imports from thence over 400 tons per annum. They are much used in the manufacturing districts of England by the operatives, who make puddings and pies of them when fresh fruit is out of season. The very fine kind which are sold in highly ornamental boxes are called French Plums or Table P.; these are a much finer variety, viz., *Catherinea*, which are much larger, and when ripe, are much sweeter. They are more carefully prepared, being gathered by hand and separately dried. They are used chiefly as a dessert fruit. The imports of these into Britain amount to upwards of 200 tons per annum.

PRUNING, the removal of branches from fruit or forest trees, in order to the greater production of fruit, the improvement of the timber, or purposes of ornament. In pruning for ornamental purposes, taste must chiefly be consulted, but reference must be made to what has been too little regarded in pruning of every kind—the nature or habit of the tree itself. Some trees will bear clipping into fantastic forms which would be utterly destructive of others. Such forms, once esteemed as the finest ornaments of a pleasure-ground, or the neighborhood of a mansion, are rejected by the simpler taste of the present age, and the *topiarian art* has few admirers. Much may be done, however, by the removal of branches, to give a finer form to ornamental trees; but in this, as in the pruning of trees grown for the sake of their timber, a great mistake is very generally committed in permitting branches to grow to a considerable size before they are cut off. It may be accepted as a general rule, that the branches removed should be small in proportion to the whole bulk of the tree. The removal of twigs and bad branches is attended by no bad effects, and may be beneficial; but the removal of large branches is dangerous. The leaving of stumps or snags is an aggravation of the evil. They rot away, and spoil the timber of the stem; indeed, a hole is not unfrequently formed. But as to forest trees, pruning may with great advantage be in great part avoided, by taking care to plant at proper distances, and thinning out the plantations sufficiently in early periods of their growth. In this way, better timber is obtained, and a greater produce from the land. Pines and firs scarcely ever require pruning, and are probably in almost all cases the worse of that which they get, except in the removal of those lower branches which have actually begun to decay. In other trees, it is sometimes of importance to watch for branches that would divide the trunk, and to prevent the division, causing the main stem to ascend higher before it forms a crown; but to be of any use, this must be done whilst the branches are still very young. Plantations should therefore be examined with a view to pruning, at intervals of not more than two years, after they are six or eight years old.

In orchards and fruit-gardens, pruning is necessary, the object being not to produce timber, or the utmost luxuriance of trees, but fruit in the greatest perfection and abundance. The habits of each kind must be studied. Even in the pruning of gooseberry and currant bushes, regard must be had to natural diversities, the gooseberry and black-currant producing fruit chiefly on young wood, whilst the red and white currant produce fruit chiefly on spurs from older branches. And so it is amongst trees; apricots, for example, producing fruit chiefly on young wood; cherries mostly on spurs, whilst plums produce both in the one way and in the other. The object of the gardener in pruning is to bring the tree into the condition best suited for producing fine fruit and in the greatest abundance; and to this the training of Wall Trees (q. v.) must also be accommodated. Sometimes, in order to produce particularly fine fruits for the improvement of the variety by seed, or for the sake of a prize at a horticultural exhibition, the gardener diminishes the number of branches likely to bear fruit, beyond what would otherwise be desirable.

The general seasons of pruning are winter and spring; but some

trees, particularly cherries, are advantageously pruned in summer, as they then throw out less gum.

Pruning instruments are of various kinds—knives, axes, saws, bills of very various forms, &c., and the *averruncator*, which may be described as a pair of scissors, one blade hooked or crooked, attached to a long handle, and working by a cord and pulley. It is scarcely used except for standard trees in gardens and orchards.

PRUNUS. See **PLUM**.

PRURI'GO is a non-contagious affection of the skin, in which intense itching is the most prominent symptoms. Sometimes the parts affected present no marked deviation from the normal type, but most commonly they are covered with papulæ, which are nearly of the same color as the skin. Hence P. has been placed among the papular diseases of the skin. William makes three varieties of this disorder—viz., *P. mitis*, *P. formicans*, and *P. senilis*. This affection seldom affects the whole surface; its favorite seats being the neck, the shoulders, the back, the outer surface of the limbs, the anus, &c. In *P. formicans* there is not only intense itching, but patients complain of a feeling like the creeping of ants (hence the specific name) or the stinging of insects, or as if hot needles were thrust into the skin. All the forms of this disease are aggravated by exposure to the air, and by heat, and the sensations are often so distressing after the patient has become warm in bed, as to prevent sleep for many hours. *P. senilis*, occurring, as its name implies, in old persons, is characterized by the extreme severity and permanence of the itching, and by the obstinacy with which it resists every kind of treatment. The different varieties of this disorder may probably be often traced either to disease of the digestive system, or to want of personal cleanliness; but in most cases their origin is obscure.

In the treatment of this disease, attention should be paid to the diet. All stimulating condiments and drinks should be forbidden, and only a plain, easily digested food allowed. Internal remedies are seldom of use excepting opium, which in severe cases is required in free or large doses, in order to procure rest. The local applications that have been recommended are very numerous. Lotions of spirit, diluted vinegar, solution of acetate of ammonia, glycerine, prussic acid, &c., and ointments containing creosote, iodide of sulphur, aconitine, &c., have been advocated by various physicians of eminence. Unless, however, the greatest attention is paid to personal cleanliness, no remedy is likely to be of permanent benefit.

PRU'SSIA (Germ. *Preussen*), a kingdom embracing nearly the whole of Northern Germany. It is bounded N. by the German Ocean, Jutland, and the Baltic; E. by Russia and Poland; S. by Austria, Saxony, Saxe-Altenburg, Saxe-Weimar, Gotha, and others of the smaller German States, Bavaria, Hesse-Darmstadt, and Alsace-Lorraine; W. by Belgium and the Netherlands. P. owns besides the detached domains of Hohenzollern (q. v.) and Jaude or Jahde on the North Sea, which lie between the boundaries of other German states.

The following table gives the area and population (1880) of the 13 Prussian provinces:

	Area in sq. m.	Pop. in 1880.
1. East Prussia	14,100	1,938,936
2. West Prussia	10,016	1,405,898
3. Brandenburg	15,401	3,889,155
4. Pomerania	11,628	1,540,034
5. Posen	11,177	1,703,397
6. Silesia	15,558	4,007,925
7. Saxony	9,743	2,312,007
8. Schleswig-Holstein	7,224	1,127,149
9. Hanover	14,855	2,120,168
10. Westphalia	7,799	2,043,442
11. Hesse-Nassau	6,021	1,554,876
12. Rhenish Prussia	10,413	4,074,000
13. Hohenzollern	441	67,624
Total	134,376	27,279,111

The duchy of Lauenburg, with an area of 452 square miles, and a population (1875) of 48,808, was incorporated with the province of Schleswig-Holstein in July 1876, and is included in the estimate given.

In 1819 the total population of P. was 10,981,984. In 1858 it was 17,739,913. In 1867 the kingdom increased from an area of 107,757 English sq. m. to its present size, had a population of 24,106,847. The census of December 1871 gave a total of 24,689,252.

Physical Character, &c.—The larger portion of P. is a part of the great plain stretching from Holland to the Ural Mountains, and, except in the south of Hanover and Silesia, is an almost unbroken level. The Sudetic Mountains, whose northern ranges, known as the Riesengebirge (q. v.), lie between the Oder and the Elbe, divide P. from Bohemia; while the Thüringerwald intersects the line dividing it from Saxony and some of the lesser German states.

Longitude East from Greenwich

The Harz Mountains (q. v.) of Hanover are now within the limits of Prussian territory. None of these ranges rise, even in their highest summits, above 5000 feet. In the east, the surface of the great plain of P. is marked by two distinct tracts of more elevated land, one of which belongs to the elevation which, running generally parallel to the Baltic, may be traced from the mouth of the Elbe to the source of the Volga, and which in P. rises about 400 feet above the sea-level. This tract is diversified with numerous lakes, none of which is more than 20 square miles in extent, but which altogether occupy an area of more than 300 square miles. The soil, consisting chiefly of loose sand interspersed with a large number of erratic blocks of granite, is sterile, covered in many places with heaths and belts of stunted pines. On the northern slope, terminating on the shores of the Baltic, there are several fertile districts, more especially along those rivers which have been carefully embanked, as the Niemen and the Vistula. The southern elevation of the Prussian plain, running between the Polish mountains of Sandomir in the south-east, and the Elbe between Magdeburg and Burg in the north-west, attains a height of about 1000 feet near Breslau on the Oder, where it is known as the Trebnitz Heights. Its general character is more fertile than the northern elevation; while the country between the two is, for the most part, extremely sterile. It includes the sandy waste in which Berlin, the capital, is situated. South of this tract, and in Silesia and Prussian Saxony, the country is fertile, including some of the most productive grain-growing districts of Prussia. Hanover has much the same character. Great marshes of peat-moors cover the north and north-west districts; but the valleys that lie among the Harz Mountains in the south are often fertile, and well adapted for agriculture. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dikes. Slesvig-Holstein, the recently annexed territory north of the Elbe, is in part sandy and healthy, like the plain of Hanover, but it has also numerous marshes. The great plain of Northern P. is watered by five large rivers—the Wesser, Elbe, Oder, Vistula, and Niemen; the numerous affluents of which, together with many smaller streams, contribute largely to the facilities of intercourse throughout the country, as many of them are navigable for vessels of several hundred tons.

The western and south-western parts of P., comprising Rhenish Prussia, Westphalia, and Hesse-Nassau, are quite distinct in their physical character from the rest of Prussia. They are divided by the Rhine into two portions, each of which has an elevated and a low plain. On the west bank of the river, the level land terminates in the northern extremity of the Vosges, or, as they are here called, the Hardt, Mountains, and extends northward as far as Aix-la-Chapelle. This table-land is broken along the banks of the Moselle by ranges of the Hochwald and the Soonwald, the highest summit of which, Walderbsenkopf, attains an elevation of about 2700 feet. The plain north of the Moselle, which is known as the Eifel and the Hohe Veen, has a mean elevation of 1600 feet, with a few higher hills. The level country between the Rhine and Maas, bordering the Eifel, is extremely fertile. On the east side of the Rhine, the table-land, rising along the banks of that river and the Maine, terminates in the ridge of the Taunus, whose highest summit, the Feldberg, attains a height of more than 2300 feet. In the north, the plain ends in the Westerwald between the Lahn and the Sieg, and in the Sauerland between the Sieg and the Ruhr. The Teutoburgerwald and the Harz Mountains cut off this region from the sandy and heathy wastes of Northern Prussia. The soil is generally poor in these districts, which, however, possess special sources of wealth in their iron and coal mines. But Hesse-Cassel, which forms part of the central plateau of Germany, is particularly fruitful, cereals of all kinds growing abundantly.

The narrow valley of the Rhine is noted as one of the most picturesque and beautiful parts of Germany. The Rhine (q. v.) is navigable throughout its entire course in P., which it traverses from south to north, receiving numerous other rivers—as the Lahn, Wied, Sieg, Wupper, Ruhr, Lippe, Berkel, and Vechte on the right; and on the left, the Ahr and the Moselle, the latter of which is navigable for more than 150 miles within the Prussian dominions. The Weser, the Elbe, the Oder, and the Vistula, as also the Spree and the Havel, affluents of the Elbe, are of high importance for the inland navigation of P., and are each discussed in special articles. The great rivers of North Germany are connected by an extensive system of canals, such as the Seckenburger, the Friedrichsgraben, the Finow, Brounberger, and Friedrich Wilhelms, and the Plauensche.

Climate, Products, &c.—The climate of P. presents great differences in the eastern and western provinces—the former being exposed to heavy snowstorms in the winter, and great drought in the summer, and with a mean annual temperature of 43°, has a summer mean temperature of 61°, and winter, 26° F.; while the latter, which have milder winters, and a larger fall of rain, have a mean annual temperature of 49°·5—summer, 68°, and winter, 35° F.

Agriculture and the rearing of cattle constitute the principal sources of employment and wealth of the rural population of the entire monarchy, and the state has hitherto directed its unremitting attention to the furtherance of the one, and the improvement of the other; abrogating onerous land-taxes, advancing money to landowners, encouraging agricultural institutions, introducing approved breeds of animals, and improved farm instruments, &c. About one-half, or 12,000,000, of the population of the kingdom are engaged in agriculture as their sole or chief occupation. Large estates, as a rule, are only to be found in the eastern and least populated provinces of the monarchy. A survey taken in 1858, gave 1,099,000 land-owners, possessing each less than 5 morgen, or $\frac{3}{4}$ acres. Wheat, rye, oats, barley, peas, millet, rape-seed, maize, linseed, tobacco, flax, hemp, hops, chicory, are extensively cultivated, and largely exported. The finest grain districts are the Börde, near Magdeburg, the low lands on the Wartha and Netze, and on the Plöne and Madue lakes, the north-eastern parts of Pomerania, the island of Rügen, the valleys of the Oder in Silesia, of the Saale, Moselle, Saar, and parts of Hesse-Nassau. Potatoes have of late years been largely grown. Western P. is noted for its excellent fruits and vegetables, and its provinces stand pre-eminent for their wines. Nassau is specially famous for its Rhine wines, Hochheimer, Johannisberg, Rudesheimer, and Assmannshäuser. The forest-lands, which are chiefly in East P., Posen, Upper Silesia, Westphalia, Southern Hanover, and Hesse-Nassau, are of great value and considerable extent, occupying an area of 10,000,000 English acres.

The mineral products of P. include coal, iron, lead, zinc, copper, cobalt, antimony, manganese, arsenic, sulphur, alum, nickel, black lead, baryta, gypsum, slate, lime, freestone, salt, amber, agate, jasper, onyx, &c. All metals, salt, precious stones, and amber belong to the crown. The latter substance is found almost exclusively along the Prussian coast from Danzig to Memel, where it is fished, dredged for, or dug up near the shore. P. has upwards of 100 mineral springs, of which the most noted and efficient are the sulphur baths of Aix-la-Chapelle and Ems, the iron springs of Schwalbach, Wilhelmsbad, Driburg, and the hot and saline baths of Reinerz, Landeck, Flinsberg, Freienwalde, Lauchstedt, Wiesbaden, Schlagenbad, and Selters.

East P. is noted for its royal studs, and the excellent breed of horses which it now raises, and of which large numbers are annually exported. Westphalia enjoys a special reputation for the excellence of its hams and pork, Pomerania for its smoked geese, and Brandenburg and Hanover for honey and wax.

Fish of all sorts are abundant in the rivers and numerous lakes; seals are taken in the Baltic. The wooded districts abound in game of every kind; pheasants, partridges, and wild-geese being often found in enormous quantities. Besides stags, fallow-deer, wild boars, foxes, otters, weasels, polecats, martens, badgers, hares and rabbits, the lynx, bear, eagle, and beavers are occasionally met with.

Manufactures, Commerce.—The principal manufactures are linens, for which certain districts of Silesia, Prussian Saxony, and Brandenburg enjoy a European celebrity; while of late years, the cotton manufactories, worked by steam, have maintained a successful rivalry with the older linens, worked by hand-looms. Besides these, there are numerous manufactories of silk, wool, mixed cotton and linen fabrics; including fine shawls and carpets in Brandenburg, stockings and ribbons in the Rhenish provinces, where, as well as in Westphalia and Hesse-Nassau, the flax, hemp, and silk and cotton thread is mainly prepared for the manufacturers. These districts, moreover, stand foremost in regard to the preparation and manufacture of iron, steel (the steel and gun works of Krupp, at Essen, being world-famous), and the metallic wares, paper, leather, soap, oil, cigars, and tobacco, and for the number of their distilleries and breweries; while Saxony and Silesia have the largest number of chicory, starch, beet-root, gunpowder, and glass works. Berlin and Elberfeld rank as the two most important centers of manufacture in the continent. The region of the Harz in Hanover is famous for its mining industries. In 1878, there were altogether in P. 1875 mines, producing coal, lignite, and iron, zinc, lead, and copper ores, and employing 225,500 persons, the value of the produce being estimated at £13,933,559. In the same year the smelting-works and foundries amounted to 1083, employing 100,870 persons, the value of the produce being £22,401,310.

The commerce of P. is materially facilitated by her central European position, and the network of river and canal navigation, which makes her territories the connecting medium between several of the great European states, and which, with 12,000 miles of railway, 22,000 miles of public roads (all, or nearly all, formed since the time of Frederick the Great), and a sea-line of 700 miles on the Baltic, and 200 on the German Ocean, give her a free outlet to the rest of the world. The Prussian mercantile marine, in 1875, numbered 3103 vessels, of 496,337 tons. The chief ports are Memel, Pillau, Königsberg, Danzig, Colberg, Swinemünde, Stettin, Wolgast, Stralsund, Kiel, Flensburg, Altona, Harburg,

Geestmünde, Leer, and Emden. The principal commercial towns are Berlin, Königsberg, Breslau, Barmen, Elberfeld, Danzig, Stettin, Cologne, Magdeburg, Aix-la-Chapelle, and Frankfurt-on-the-Maine. Annual fairs are still held at Breslau, Magdeburg, and Frankfurt-on-the-Oder.

The money, measures, and weights of P. are those in use throughout the German Empire. In accordance with the law of 1872, the mark is the unit of reckoning, and have gradually displaced Thalers (q. v.) and silbergroschen. The Prussian or Berlin Bank, founded in 1765, with numerous branches in the provinces, is the most important of those banks which possess the right of issuing notes.

Religion, &c.—The dominant religion is Protestantism, and since 1817, the Lutheran and Reformed Churches have been united under the head of one common evangelical church. Everything connected with the external administration of church matters is under the control of the minister of public instruction and ecclesiastical affairs, but every religious community manages its own internal concerns; the Protestant churches acting in conjunction with consistories or boards appointed by the government, one of which exists in each province, under the direction of the upper president, or provincial governor, and clerical superintendents-general, who in Posen and Pomerania bear the title of bishop; while the Roman Catholic Church is directed by the two archbishops of Posen and Gnesen, and Cologne, under whom stand the four bishoprics of Culm, Münster, Paderborn, and Treves.

The two episcopal sees of Breslau and Emsland are directly under the jurisdiction of the pope, while the district of Glatz, in Silesia, belongs to the archbishopric of Prague, and Katscher, in Upper Silesia, to that of Olmütz. The results of the census of 1880, as regards the numbers of the religious bodies, are as follows: the Protestants of P. numbered 17,645,462; Roman Catholics, 9,205,136. This gives a percentage of 64.7 of the population to Protestantism, and of 35.1 to Roman Catholicism. The Protestants were in the predominance in the new provinces annexed in 1866. The higher Roman Catholic clergy are paid by the state. In 1881, by the operation of the Falk laws, no less than two-thirds of the Prussian bishoprics were vacant. Recently endeavors have been made to bring to a conciliatory conclusion the *Kulturkampf*, the controversy between church and state, which led to so abnormal a state of affairs.

Education.—Education is compulsory in P., and its management and direction are under the control of the state. In no country are better or ampler means supplied for the diffusion of knowledge among all classes of the community. P. has ten universities—viz., Königsberg, Berlin, Greifswald, Breslau, Halle, Göttingen, Münster, Bonn, Kiel, and Marburg, which, in 1883, numbered above 1000 professors and teachers, and 10,850 students. The Prussian schools are divided into eleven classes—viz., 1. *Elementary*, embracing village or town schools; 2. *Bürgerschulen*, or citizen schools; 3. *Real-schulen*, or schools in which arts, sciences, and languages are taught; 4. Seminaries, or schools for training elementary schoolmasters; 5. *Gymnasien*, or high schools for classical education; 6. Industrial schools; 7. Schools of Architecture; 8. Schools of mines; 9. Schools of agriculture; 10. Veterinary schools; and 11. Universities. Between 1870 and 1880, there were in P. 35,000 elementary schools, with 56,000 teachers, and 4,000,000 pupils. The management of the elementary national schools is in the hands of the local communities; but the state appoints the teachers, and in part pays their salaries, the remainder being supplied by the public. In addition to the libraries of the several universities there is the Royal Library at Berlin, with 700,000 volumes and about 15,000 MSS.

Among the numerous scientific, artistic, and literary schools and societies of P., the following are some of the more distinguished: the Academy of Arts, founded in 1699; the Royal Museum of Arts; the Academy of Sciences; the Natural History, Geographical and Polytechnic Societies of Berlin; the Antiquarian Society of Stettin; the Breslau Natural History and Historical Societies; &c.

Justice.—Till lately, the *Code Napoléon* was in force in the Rhenish provinces, and in Hither-Pomerania, the common German law; but in other parts of the kingdom the Prussian Code, compiled under Frederick the Great's direction, was followed. A new penal code was promulgated in 1850, by which all pre-existing seigniorial, municipal or ecclesiastical rights of decreeing punishments were unconditionally abrogated. A partial codification was brought about in 1863; and in 1869 a code of commercial law valid for the North German Confederation. Since the establishment of the empire Imperial law has precedence of that peculiar to the various states in a large number of subjects. A universal criminal code is now in force for the whole empire; and a common judicature bill for the empire at large was introduced in 1879. Prussia has 16 *Oberlandesgerichte* or provincial courts, one or more in each province. Connected with that sitting at Berlin is the Privy-council of Justice, which has jurisdiction over the royal family and the princely houses of Hohenzollern. The supreme

tribunal of the empire has recently been established, not at Berlin, but at Leipzig.

Army, Navy, &c.—In 1881, the strength of the Prussian army, on a peace-footing, according to official returns, numbered 344,630, of whom 53,000 were cavalry, and 40,000 artillery. On the war-footing the numbers can be raised to 900,000. The army consists of the regular troops and the Landwehr (q. v.), and in time of war an extra force can be called up under the title of the landsturm. Every able-bodied male Prussian is liable to be called upon to serve between 20 and 36 years of age (see GERMANY). Mennonites (see ANABAPTISTS), clergymen of the Roman Catholic and Evangelical churches, and indispensable supporters of families are exempt. The time of active service is three years for some branches of the service, and two for others. In peace, the army lies distributed over 309 garrison towns, and 29 fortresses, of which latter the following are fortified places of the first rank: Mainz, Coblenz (with Ehrenbreitstein), Cologne, Königsberg, Magdeburg, Spandau, and Posen. Great care is bestowed on the education and military training of officers and men; and besides numerous admirable academies, there are several good schools of operative and veterinary surgery, &c., connected with the educational department of the army. The navy of the new German empire is the navy of Prussia. See GERMANY.

Constitution, &c.—P. was an absolute monarchy till the crisis of 1848, when the decided movement in favor of liberal views compelled the late king to convoke a national assembly, and submit to the establishment of a constitutional form of government, which has been repeatedly modified. The national representative body consists of two bodies. 1. An upper chamber (*Herrenhaus*, or 'House of Lords'), which is now composed of the princes of the royal family who are of age, the chiefs of the mediatised princely houses, recognized by the Congress of Vienna, and numbering 16 in P., the heads of the territorial nobility (about 50), life-peers chosen by the king from the class of rich land-owners, manufacturers, and 'national celebrities,' a titled representative chosen by all land-owners in each of the Prussian provinces, representatives of the universities, the burgomasters of all towns having more than 50,000 inhabitants, and an indefinite number of members appointed by the king for life or for a limited period. 2. A lower chamber (*Abgeordnetenhaus*, or 'Chamber of Deputies'), composed of 432 members, 352 for the old kingdom, and 80 for the provinces annexed in 1867.

Every Prussian who has attained his 25th year, and who has a municipal vote, has also a parliamentary vote, but not a direct one. Out of every 250 *Urwähler*, or electors in the first instance, is chosen a *Wahlmann*, or direct elector. This is the man who, strictly speaking, votes for a member of parliament. Representatives are elected for three years. In addition to this general house of assembly, there are representative bodies for the provinces, communes, and circles, which debate and legislate in regard to local matters within their several departments. The council of state is composed of 8 ministers, under whose ministries are numerous departments, embracing almost every conceivable subdivision of foreign policy or internal legislation, since nothing can be done in P. independently of the state. By the modified constitution of 1850, all exclusive privileges arising from titles or station are abrogated, and perfect equality in the eye of the law fully recognized; liberty of the subject guaranteed in regard to religious persuasions, the right to hold meetings unarmed within closed doors, and become members of societies; immunity from domiciliary visits, and inviolability of letters, &c. The monarchy is hereditary in the male line. The sovereign and royal family must profess the evangelical confession of faith. The king, who is not responsible for the measures of his government, and whose decrees require the counter-signatures of his ministers, exercises the executive power, nominates and dismisses the ministry, summons and dissolves the chambers, orders the promulgation of the laws, is commander-in-chief of the forces, has the right of proclaiming peace and war, granting reprieves, &c. He bears the titles of King of Prussia, *Merkgraf* of Brandenburg, Sovereign-duke of Silesia, Prince of Orange, Grand-duke of Pomerania and the Lower Rhine, besides a host of lesser titles. The title 'Emperor of Germany,' by which he is now best known, is not, of course, a Prussian dignity. The arms of P. are composed of four central shields borne on the great shield of 48 fields, representing the different territories incorporated in the Prussian monarchy.

The black eagle on a field argent, surmounted by the open crown, is the special cognizance of P. Proper. The national colors are black and white; the standard is white, bearing the Prussian crowned eagle and an iron cross in the right corner. The eldest son of the king bears the title of Crown-prince. The ordinary royal residences are the palaces at Berlin, Potsdam, and Charlottenburg. The royal domains were ceded to the state by Frederick-William III. in 1820, on condition of a rental of 24 million thalers being paid first from them for the king and his family, which, however, has been largely increased of late years,

by means of a *Kronotation* ('crown allowance'). Among the numerous military orders, the following deserve notice: the Order of the Swan, founded in 1443; and that of the Black Eagle, founded in 1701, regarded as of the highest dignity.

According to the budget estimate for 1881-82, the net receipts for that year were 501,759,207 marks (£25,087,960): the ordinary expenditure amounted, however, to 873,020,893 marks; though ordinarily receipts and expenditure are made to balance. The total debt was 1,995,312,989 marks (£99,765,649).

Population, Races.—About seven-eighths of the population of P. are Germans. Of the Slavonic tribes, the most numerous are Poles, numbering 2½ millions. In Brandenburg and Silesia, there are about 83,000 Wends; in East P., upwards of 146,000 Lithuanians; Western P. has rather more than 10,000 Walloons, using the French language; intermixed in its generally German population, Silesia has 50,000 Czechs or Bohemians; Slesvig-Holstein, 150,000 Danes—making in all about 3 millions who do not use the German language, or who employ it only as secondary to their native tongues.

Ranks, Classes.—Three distinct hereditary classes are recognized in P., viz., nobles, burghers, and peasants. To the first belong nearly 200,000 persons, including the higher officials of the state, although that number does not comprise the various mediatised houses, of which 16 are Prussian, and others belonging to different states, but connected with P. by still existing, or former territorial possessions. The burgher class includes, in its higher branches, all public office-bearers, professional men, artists, and merchants; while the peasantry—to which belong all persons engaged in agricultural pursuits—are divided into classes, depending on the number of horses employed on the land, &c.

History.—The lands bounded by the Baltic, which now form part of P., were early occupied by Slavonic tribes, nearly allied to the Letts and Lithuanians. It is conjectured that they were visited by Phœnician navigators in the 4th c. B.C.; but beyond the fact of their having come into temporary conflict with the Goths and other Teutonic hordes, prior to the great exodus of the latter from their northern homes, little is known of the people till the 10th c., when they first appear in history under the name of Borussi, or Prussians. In 997, Bishop Adalbert of Prague suffered martyrdom at their hands, while endeavoring to convert the people to Christianity. Boleslas, Duke of Poland, succeeded, however, about 1018, in compelling them to submit to baptism and subjection. After many futile attempts on the part of the people to throw off the yoke of Christianity and foreign domination, they finally made a successful stand against Boleslas IV. of Poland in 1161, and for a time maintained a rude and savage kind of independence, which the disturbed condition of Poland prevented its rulers from breaking down. The fear of losing their freedom if they adopted Christianity, made the Prussians obstinately resist every effort for their conversion; and it was not till the middle of the 13th c., when the knights of the Teutonic order entered upon their 'famous' crusade against them, that the Christian faith was formally established among them. The aggressive inroads of the pagan Prussians on the territories of their Christian neighbors, and their advance into Pomerania, were the exciting causes of this important movement.

The knights of the order, when appealed to by Conrad, Duke of Masovia, to aid in the subjection of the heathen, gladly promised their services, on condition of being permitted to retain possession of the lands which they might conquer; and having entered the Prussian territories in considerable numbers, they entrenched themselves at Vogelsang and Nesselau in 1230, and at once entered upon the conquest of Prussia. For half a century the belligerent brotherhood were engaged in war with the people—winning lands and souls by hard fighting—until at length, in 1283, they found themselves undisputed masters of the country, which they had both civilized and Christianized after a fashion, namely, by almost exterminating the pagan population. During this period of struggle, the knights founded the cities of Thorn, Kulm, Marienwerder, Memel, and Königsburg, repopled the country with German colonists, encouraged agriculture and trade, and laid the foundation of a well-ordered, prosperous state. The unhappy wars between the knights and the Poles and Lithuanians, together with the moral degeneracy of the order, led, in the 14th and 15th centuries, to the gradual decline of their supremacy. In 1454, the municipal and noble classes, with the co-operation of Poland, rose in open rebellion against the knights, who were finally compelled to seek peace at any cost, and obliged, in 1466, to accept the terms offered to them by the Treaty of Thorn, by which West P. and Ermland were ceded by them unconditionally to Poland, and the remainder of their territories declared to be fiefs of that kingdom. In 1511, the knights elected as their grand-master the Markgraf Albert of Anspach and Baireuth, a kinsman of the king of Poland, and a scion of the Frankish line of the Hohenzollern family. Although his election did not immediately result, as the knights had hoped, in securing them allies powerful enough to aid them in emancipating themselves from Polish domination, it

was fraught with important consequences to Germany at large, no less than to the order itself.

In 1525, the grand-master was acknowledged Duke of P., which was converted into a secular duchy (afterwards known as East P.), and renounced the Roman Catholic religion for Lutheranism, his example being followed by many of the knights. The country made rapid advances under the rule of Albert, who improved the mode of administering the law, restored some order to the finances of the state, established schools, founded the university of Königsburg (1544), and caused the Bible to be translated into Polish, and several books of instruction to be printed in German, Polish, and Lithuanian. His son and successor, Albert Frederick, having become insane, a regency was appointed. Several of his kinsmen in turn enjoyed the dignity of regent, and finally his son-in-law, Johann Sigismund, elector of Brandenburg, after having held the administration of affairs in his hands for some years, was, on the death of the duke in 1618, recognized as his successor, both by the people and by the king of Poland, from whom he received the investiture of the duchy of P.; which, since that period, has been governed by the Hohenzollern-Brandenburg House.

Here it will be necessary to retrace our steps in order briefly to consider the political and dynastic relations of the other parts of the Prussian state. In the 12th c. the northern Mark, comprising probably the territory between the Elbe and the Oder, as far as its confluence with the Spree, was held by the immediate descendants of Albert the Bear of Luxemburg, its first hereditary markgraf, who, during the next two or three centuries, extended their dominions eastward, beyond the Oder into Further Pomerania. On the extinction of this line, known as the Acanian house, a remote kinsman, Frederick VI., count of Hohenzollern, and markgraf of Nürnberg, became possessed, partly by purchase and partly by investiture from the emperor, of the Brandenburg lands, which, in his favor, were constituted into an electorate. This prince, known as the Elector Frederick I., received his investiture in 1417. He united under his rule, in addition to his hereditary Franconian lands of Anspach and Baireuth, a territory of more than 11,000 square miles. His reign was disturbed by the insubordination of the nobles, and the constant incursions of his Prussian and Polish neighbors, but by his firmness and resolution he restored order at home and enlarged his boundaries.

Under Frederick's successors the Brandenburg territory was augmented by the addition of many new acquisitions, although the system of granting appanages to the younger members of the reigning house, common at that time, deprived the electorate of some of its original domains, as for instance the markgratate of Anspach, which passed, on the death of the Elector Albert Achilles in 1486, as an independent state to his younger sons and their descendants. The most considerable addition to the electorate was the one to which reference has already been made, and which fell to the Elector John Sigismund through his marriage in 1609 with Anne, daughter and heiress of Albert Frederick the Insane, duke of Prussia. In consequence of this alliance, the duchy of Cleves, the countships of Ravensberg, the Mark, and Limburg, and the extensive duchy of P., now known as East P., became incorporated with the Brandenburg territories, which were thus more than doubled in area. The Reign of John Sigismund's successor, Georg-Wilhelm (1619-1640), was distracted by the miseries of the Thirty Years' War, and the country was alternately the prey of Swedish and imperial armies; and on the accession of Georg-Wilhelm's son, the great Elector Frederick-William (q. v.), in 1640, the electorate was sunk in the lowest depths of social misery and financial embarrassment. But so wise, prudent, and vigorous was the government of this prince, that at his death in 1688 he left a well-filled exchequer, and a fairly-equipped army of 38,000 men; while the electorate, which now possessed a population of one and a half million, and an area of 42,000 square miles, had been raised by his genius to the rank of a great European power. His successors, Frederick III. (q. v.), (1688-1713) and Frederick-William I. (1713-1740), each in his own way increased the power and credit of P., which had been in 1701 raised to the rank of a kingdom. The latter monarch was distinguished for his rigid economy of the public money and an extraordinary penchant for tall soldiers, and left to his son, the great Frederick II. (q. v.), a compact and prosperous state, a well-disciplined army, and a sum of nearly nine million thalers in his treasury.

Frederick II. (1740-1786) dexterously availed himself of the extraordinary advantages of his position to raise P. to the rank of one of the great political powers of Europe. In the intervals between his great wars, he devoted all his energies to the improvement of the state, by encouraging agriculture, trade, and commerce, and reorganizing the military, financial, and judicial departments of the state. By his liberal views in regard to religion, science, and government, he inaugurated a system whose results reacted on the whole of Europe; and in Germany, more especially, he gave a new stimulus to thought, and roused the dormant

patriotism of the people. Frederick was not over-scrupulous in his means of enlarging his dominions, as he proved by sharing in the first partition of Poland in 1772, when he obtained as his portion nearly all West P., and several other districts in East Prussia. His nephew and successor, Frederick-William II. (1786–1797), aggrandized his kingdom by the second and third partitions of Poland in 1793 and 1795. Frederick-William III. (q. v.), (1797–1840), who had been educated under the direction of his grand-uncle, Frederick the Great, succeeded his father in 1797, at a time of extreme difficulty, when continental rulers had no choice beyond being the opponents, the tools, or the victims of French republican ambition. By endeavoring to maintain a neutral attitude, P. lost her political importance, and gained no real friends, but many covert enemies. But the calamities which this line of policy brought upon P. roused Frederick-William from his apathy, and with energy, perseverance, and self-denial worthy of all praise, he devoted himself, with his minister Count Hardenberg, to the reorganization of the state. In the ten years which succeeded the battle of Waterloo, P. underwent a complete reorganization. Trade received a new impulse through the various commercial treaties made with the maritime nations of the world, the formation of excellent roads, the establishment of steam and sailing packets on the great rivers, and at a later period the organization of the customs-treaty, known as the Zollverein (q. v.) between P. and the other states of Northern Germany, and through the formation of an extended network of railways. The most ample and liberal provision was made for the diffusion of education over every part of the kingdom, and to every class.

In like manner, the established Protestant Church was enriched by the newly-inaugurated system of government supervision, churches were built, the emoluments of the clergy were raised, and their dwellings improved; but not content with that, the king wished to legislate for the church in accordance with a set plan; and when the various Protestant churches refused to be joined in the union prescribed for them, difficulties arose. This tendency to over-legislation has long been the predominating evil feature of Prussian administration; and the state, without regard to the incongruous elements of which it was composed, was divided and subdivided into governmental departments, which, in their turn, under some head or other, brought every individual act under governmental supervision, to the utter annihilation of political independence. The people, when they gradually began to comprehend the nature of this administrative machinery, saw that it made no provision for political and civil liberty, and demanded of the king the fulfilment of the promise he had given in 1815 of establishing a representative constitution for the whole kingdom. This demand was not acceded to by the king, and its immediate fruits were strenuous efforts on his part to check the spirit of liberalism. Every measure taken by other sovereigns to put down political movements was vigorously abetted by him. Siding with the pietists of Germany, he introduced a sort of Jesuitical despotism, which was continued by his successor, Frederick-William IV. The Landstände or provincial estates, organized in accordance with the system of the middle ages, were the sole and inadequate mode of representation granted to P. in this reign, notwithstanding the pledge made to the nation for a full and general representative government. An attempt made forcibly to unite Lutheran and Reformed Churches excited universal indignation, while the imprisonment, at a later period, of the Archbishops of Cologne and Gnesen for their conduct in regard to the vexed question of mixed marriages, involved the king in a long and fruitless dispute with the pope.

The accession of Frederick-William IV. in 1840 seemed to open a better prospect to the friends of constitutional freedom, but the reality was scarcely equal to the expectations which had been warranted by the professions of the government. Still new hopes and requirements had been excited, and a new life was infused into every department of the state. Every branch of science, art, and literature was understood to receive the attentive consideration of the sovereign, who professed to be (and, doubtless, in a sort of way, was) actuated by a love of universal progress. He made similar professions in regard to religious toleration, but the pietistic tendencies of his government exerted a forced and prejudicial influence in every department of the state; while the bureaucratic spirit of over-governing which characterized the administration was becoming daily more and more irksome to the nation, and gave rise to the formation of free churches or Protestant communities; while a contemporaneous excitement which had arisen in the Roman Catholic Church of P., as the result of the schismatic movement due to the stand taken by the chaplain Ronge (q. v.) on the exhibition of the so-called Holy Coat of Treves (q. v.), further complicated the relations between church and state. The king and his advisers, underrating the importance of the movement of 1848 in Germany, thought they had satisfied the requirements of the hour by granting a few unimportant reforms, and making equivocal promises of further concessions. When at length, however, the citizens and troops came into col-

lision, and blood was shed, Frederick-William came forward as the professed regenerator of his country, offering to lay down his royal title and merge his kingdom in the common fatherland, for the salvation of which he recommended a cordial union of all German princes and people in one bond, and proposing himself as the guide and leader of this new Germany. His own subjects, and many Germans in other states, hailed with delight professions which seemed to give a living embodiment to the national desire for unity.

The publication of a political amnesty, the nomination of a liberal ministry, the recognition of a civic guard, the retirement of the Prince of Prussia, the heir-presumptive—with whom every arbitrary measure of government was believed to originate—and the summons of a representative chamber to discuss the proposed constitution—all tended to allay the general discontent. It might have been well if the German states and the German democracy had resolved at this time to accept the leadership of P., but the so-called national assembly at Frankfurt declined to do this, and elected the Archduke John of Austria lieutenant-general of Germany. A feeling of deep chagrin on the part of the Prussian king was the result of that extremely unwise and unpatriotic act, dictated by a fear of Prussian military strength, and oblivious of the fact that P., in spite of its despotic government, was the country most thoroughly penetrated by Germanic ideas. His ardor in the cause of the fatherland cooled, his pledges to his own subjects remained unfulfilled as long and as completely as the occasion permitted, and his policy became more strongly tinged than before with a jealousy of Austria. His powerful co-operation in putting down the insurrection in Poland, and the democratic party in Baden, gave, however, ample proof of his determined opposition to every popular demonstration against absolutism. In the first war of the Slesvig-Holstein duchies, the Prussians acted in concert with the disaffected against their sovereign, the king of Denmark, occupying the ducal provinces in the name and on behalf of the diet. The latter years of this reign were characterized by great advance in the material prosperity and internal improvement of the country. Extensive lines of railway and post-roads were opened, the river navigation greatly facilitated, treaties of commerce formed with foreign countries, and great expansion given to the Prussian and North German Zollverein (q. v.), the army put upon a footing of hitherto unprecedented efficiency of arms and artillery, and the educational system of the country still further developed.

The political freedom of P. did not, however, make equal advance. The chambers which met for the discussion and framing of a constitutional mode of government, were constantly interrupted and obstructed in the prosecution of their task, and the constitution was modified every year between 1850 and 1857, until it retained few of its original bases. Wilhelm I., who succeeded his brother in 1861, and in 1871 became German Emperor, was no more a lover of constitutional, or at least of popular, liberty than any of his predecessors; and for some years he strove hard to check the progress of the popular movement, in so far as it aimed at interference with the absoluteness of the regal power, and he repeatedly rejected measures of reform recommended by the Prussian Chamber of Deputies; but, on the other hand, it must be allowed that he has shown himself zealous for the honor and greatness of Germany above all other princes of the empire; and the exigencies of the great war with France (1870–71) have compelled the Prussian government to bring itself into closer relations with popular feeling, though constitutional freedom is still far from being fully enjoyed. For the later history of P. both military and political, see GERMANY, SLESVIG-HOLSTEIN, and BISMARCK.

PRUSSIA, a province of the kingdom of Prussia, now usually divided into the two provinces of East P. and West P. The joint province of P. is bounded on the S.W. by Pomerania and the Baltic Sea, and on the E. and S. by Russia and Poland. East P. has an area of 14,100 sq. miles, and a pop. (1890) of 1,933,936; West P., of 10,016 sq. miles, and 1,405,898 inhabitants. About two-thirds of the soil consists of good land, the remainder being chiefly sandy. Agriculture is by far the most important branch of industry, manufactures being confined to such articles as supply merely local wants. Wheat is extensively cultivated, especially in the district of Gumbinnen; and, as the inhabitants live chiefly upon rye, the larger half of the wheat grown is exported. P. possesses a larger number of horses than any other province in the kingdom. For the history of the province of P., and for its principal physical features, see PRUSSIA, KINGDOM OF.

PRUSSIAN BLUE. See BLUE, CYANOGEN, FERROCYANOGEN, and FERRIDCYANOGEN.

PRUSSIC ACID. See HYDROCYANIC ACID.

PRUTH, an important affluent of the Danube, rises in the south-east of the Austrian crown-land of Galicia, on the north-east side of the Carpathian mountains, and near the base of

Mount Rusky in that range. It flows in a deep valley eastward past Kolomea and Czernowitz, and from the point at which it leaves Austrian territory to its embouchure in the Danube at Reni, 12 miles below Galatz, it forms again, as it used to do before 1856, the boundary between the Russian province of Bessarabia and Roumania. Length about 500 miles. Swift in its upper course, the P. becomes navigable near Jassy. Its affluents are numerous, but inconsiderable.

PRYNNE, WILLIAM, noted as a pamphleteer and active politician during the reign of Charles I., and the subsequent period of the Commonwealth, was born near Bath in the year 1600. He received his early education there, and was afterwards transferred to Oriel College, Oxford, where, in 1620, he took his bachelor's degree. Selecting the law as his profession, he entered himself at Lincoln's Inn, where he became a benchler and reader; but it does not appear that he ever very seriously endeavored to obtain practice at the bar. He was early drawn into the vortex of ecclesiastical controversy, and speedily made himself heard of as a champion of the Puritan party. In 1632, appeared his *Histriomastix, or a Scourge for Stage Players*, a tasteless and scurrilous attack on the popular amusements of the period, which procured him the attention of the authorities. For this performance he underwent prosecution in the Star Chamber, with results sufficiently unpleasant. His sentence involved him in a fine of £3000, degradation from the bar, expulsion from Oxford and Lincoln's Inn, the loss of both his ears in the pillory, and the shock to his vanity as an author, of seeing his book burned in public by the hangman. He was, moreover, condemned to perpetual imprisonment, and immured in the Tower accordingly. If the severity of the punishment seems, at first sight, astounding in its disproportion to the nature and amount of the offence, it is perhaps sufficiently explained by the fact, that P., by his previous issue of a series of anti-prelatical tracts, as by other indications of hostility, had made himself most obnoxious to Archbishop Laud and the clergy.

Three years after, the pertinacious offender found means to publish from his prison another pamphlet in which he fiercely attacked the hierarchy, and was unsparing in his personal abuse of Laud and certain other bishops. For this he was again prosecuted; a fine of £5000 was imposed upon him; he was once more pilloried, losing such stumps of ears as the executioner had before spared; and was branded on both cheeks with the letters S. L. (Seditious Libeller). He was then removed to Caernarvon Castle, and afterwards to that of Mont Orgueil, Jersey, where he remained a close prisoner, till, in 1641—the Long Parliament then sitting—he was released by a warrant of the House of Commons, and a tumultuous expression of popular sympathy celebrated his restoration to liberty. Shortly afterwards, he was sent to parliament as member for Newport, in Cornwall, and for some years was actively, and, at times, even prominently engaged on the popular side in the proceedings of the House of Commons. In the extreme measures, however, leading to the deposition and death of the king, he declined all share; and being one of those of whom Cromwell shortly after 'purged' the House of Commons, he proceeded to assail him in print with an asperity not inferior to that with which he had before made war upon the bishops, as a consequence of which imprudence he was once more subjected to several years' imprisonment. On Cromwell's death he returned to his place in parliament, zealously interesting himself in the royal cause; and after the Restoration, the office was bestowed on him of Keeper of the Records in the Tower. Subsequently his inveterate habit of venomous pamphleteering involved him in difficulties with the House of Commons, from which, on a charge of seditious libel, he narrowly escaped expulsion. He died at Lincoln's Inn in October 1669. The continuous stream of writings on the perilous topics of the day, which brought him so constantly into trouble, represents but a fraction of P.'s literary activity. He busied himself as a compiler of matter illustrative of constitutional and parliamentary history. His most valuable works in this field are the *Calendar of Parliamentary Writs*, and his *Records*, both of which contain much that is useful and important.

PRZE'MYSL, a town of the Austrian Empire, in the province of Easter Galicia, on the right bank of the San, an affluent of the Vistula, 53 miles west from Lemberg. It is connected by railway with Cracow, and so with the west and north of Germany on the one hand, and with Lemberg on the other. P. is a flourishing town, carries on a considerable trade, and has manufactures of linens and leather. Pop. (1880) 22,379.

PRZI'BRAM, a town of the Austrian Empire, in Bohemia, 33 miles south-south-west from Prague, on the Litawka, a feeder of the Moldau. It derives its importance chiefly from extensive lead and silver mines in the neighborhood, and is the seat of a superior court of mines. Pop. (1880) 11,020.

PSALMANAZAR, GEORGE, a somewhat remarkable impostor, was born about the year 1680. His real name and the place of his birth are unknown, but he is presumed to have been a native of

Switzerland or the South of France. He received a good education, and gave early indication of talent, more especially for the acquisition of languages. Impelled by a restless and impatient temper, which indisposed him to any regular pursuit, for some years he roamed over Europe as a mere vagabond adventurer, assuming at first the disguise of an Irish pilgrim, exiled on account of his religion; and afterwards as soldier, menial, preceptor, beggar, or vagrant nondescript, living on his wits as he could, according to the whim or necessity of the hour. In the course of his wanderings, he was thrown into contact with a Colonel Lauder, commanding a Scotch regiment at Sluys, on whom he first passed the imposture to which he subsequently owed his notoriety, assuming the name by which he is since known, and representing himself as a Japanese convert to Christianity and native of the island Formosa. The good colonel seems to have been completely deceived by him; not so, however, the chaplain of the regiment, one Innes, a man equally acute and unprincipled, who speedily detected the deception, but was not the less willing to use it for the furtherance of his own ends.

By Innes, P. was brought to England, and instantly became the religious lion of the day, his patron skilfully availing himself of the connection to secure for himself preferment in the church. Dignitaries of the church contended for the honor of being serviceable to him; and through the influence of the Bishop of Oxford apartments were assigned him at the university, in order that he might prosecute his studies there. The talent, ingenuity, and resource which he displayed in keeping up the deception, go far to account for what may seem to us the strange credulity with which his story was received. He published, in Latin, a fabulous account of the island Formosa, the consistency and verisimilitude of which imposed upon the learned world. He also invented a language, compact and somewhat complex in structure; and was able, in virtue of a memory not less than astonishing, to defy the ordinary methods of detection. In the midst of his success, however, at the age of about 32, he became the subject of religious impressions, and his conscience awoke to the ignominy of the deceit which he was practising. Urged by what seems to have been a genuine feeling of penitence, he withdrew himself from public notice, and for the rest of his long life honorably earned his livelihood by literature, in which he had a moderate success. Besides much assiduous compilation for the booksellers, of history, geography, and the like, he published several works anonymously, one of which, *An Essay on Miracles, by a Layman*, was for some time exceedingly popular. On his death in London in 1762, it was found that he had also busied himself in preparing for posthumous publication an account of his curious career, which, under the title *Memoirs of —, commonly known as George Psalmanazar, a reputed native of Formosa, written by himself*, was some years after given to the world.

PSALMODY, in its widest sense, is the singing of the Psalms of David and other sacred songs; but from the beginning of the Reformation period, the term has been restricted to the singing of metrical versions of the Psalms to short simple airs. Psalm-singing was of ancient date among the Jews, and was practised from the first ages of Christianity; the charge of Pliny the Younger against the Christians was, that they sung psalms to Christ 'quasi Deo.' No authentic record, however, exists of the kind of melodies sung to the psalms by the primitive Christians. The practice of singing psalms in antiphony, or by two choirs, as still practised (see ANTIPHONY), was introduced at an early period; it is said to have begun in the Eastern Church by Ignatius, Bishop of Antioch, in the 2d c.; and in the Western Church by Ambrose, Bishop of Milan, in the 4th century. At first, the whole congregation, clergy and laity, joined in the psalms; but difficulties and abuses arose from the growing neglect of musical cultivation; and with a view of restoring public decency and order, the Council of Laodicea, in the year 363, considered it necessary to forbid the laity to sing in church at all, except in certain simple chants of a popular description. Down to the Reformation, the music of the church was surrendered to the clergy and trained musicians.

Psalmody, in the more modern sense, began in the 16th c., when Clement Marot, the court-poet of Francis I. of France, translated 52 of the Psalms into French verse, dedicating them both to his royal master—whom he likened to the Hebrew psalmist—and to the ladies of France. The sacred song-book, on its first appearance, not being accompanied by music, it became the practice to sing the psalms to favorite tunes—often those of popular ballads, and for a considerable time, psalm-singing became a favorite fashion among the gay courtiers of Francis.

Marot's collection was continued and concluded by Theodore Beza, whose psalms had the advantage of being set to music, Beza having in this the assistance of Calvin, who engaged the best composers of the day to unite his sacred songs with beautiful and simple airs of a devotional character. Psalm-singing was taken up by the Reformers, first for private devotion, and soon as part of the service of the church, Luther and Calvin restoring to

the people their share in the musical part of public worship, and furnishing them with the means of performing it. From the time that psalm-singing was adopted by the Reformers it was discountenanced by the Roman Catholics, and soon came to be regarded as a badge of Protestantism. Luther and Calvin differed, however, in their ideal of psalmody; the former was favorable to harmony in parts, while the latter confined himself to the bare unaccompanied melody. Once taken up by the Calvinists and Lutherans, psalmody spread over France, Germany, and the Low Countries, and reached England at the moment of her embracing the Reformation. The first English metrical version of the Psalms was made in the reign of Henry VIII. by Thomas Sternhold, a native of Hampshire, groom of the robes to King Henry, aided by John Hopkins and William Whytinghame. Vocal psalmody was soon after introduced into the church-service, the choral mode of singing being still retained in cathedrals and collegiate churches, and the liturgical hymns being retained in the prayer-book. Of the psalm-tunes which came into use, some have been attributed to Claude Goudimel, Claude Le Jeune, and Guillaume Franc, and a few owe their origin to Luther. The well-known 100th Psalm is an adaptation of Gregorian phrases by Guillaume Franc.

The first important collection of psalm-tunes for four voices published in England was made by Thomas Ravenscroft, Mus. Bac., and appeared in 1621; it was entitled '*The whole Booke of Psalms, &c.*, composed into four parts by sundry authors, to such several tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands.' In this collection were included contributions by Tallis, Morley, Dowland, and all the great masters of the day, as well as by Ravenscroft himself, who contributed the tunes St. David's, Bangor, and Canterbury. The name of John Milton, father of the poet, appears as composer of the tunes, York and Norwich. According to the then prevalent usage, the subject or air was given to the tenor voice. This custom was first departed from in the *Whole Book of Psalms, in Three Parts*, published in 1671, compiled and arranged by John Playford—whom Sir J. Hawkins calls the 'father of modern psalmody'—where we have the more proper practice, which has since obtained, of making the melody the soprano part. Croft, Courteville, Cary, the Bachs, and Handel have, since that time, contributed to the psalmody in use in Britain.

Among other metrical versions of the Psalms produced was one of doubtful origin which was attributed to James I.; and which, notwithstanding a strong recommendation by his son, was never much used in churches. The version of the Psalms by Sternhold and Hopkins came to be supplanted in England, toward the beginning of the last century, by that of Nahum Tate, poet-laureate under William III. and Anne, and Dr. Nicholas Brady, less literal in its renderings than its predecessor, and somewhat commonplace as regards poetical character. This *New Version of the Psalms* first appeared in 1698, with the royal authority allowing its use in churches. Of late years, modern hymns, selected according to the taste and at the will of the incumbent, have to a large extent taken the place of metrical psalms in the Church of England.

In Scotland, the early Reformers paid great attention to singing. In John Knox's Psalter, arranged for use in churches, the metrical psalms are set to music in harmony of four parts. Several early translations of the Psalms were produced in North Britain, but that of Sternhold and Hopkins was used in worship from 1564 down to the middle of the 17th century. In 1632, an attempt made by Charles I. to supersede it by King James's version, was more resolutely and decidedly opposed than in England. The version now in use in Scotland was introduced during the Commonwealth by the General Assembly, and founded on the metrical translation of Francis Rous, a member of Cromwell's council. This new version was in 1649 appointed by the General Assembly to be the only paraphrase of the Psalms sung in the Kirk of Scotland. About the beginning of the 18th century, an agitation began for the enlarging of the psalmody of the Kirk, by adding to it paraphrases of other portions of Scripture. A collection of such paraphrases was published in 1745, and was widely used. In 1775, a committee was appointed to revise it; and in 1781 the collection which has been so long in use was sanctioned by a *permissive* act of Assembly. In addition to these, separate hymn-books are now sanctioned in the Established and Free Churches of Scotland, and have long aided in the worship of the U. P. Church.

PSALMS (Heb. *Tehillim*, Songs of Praise, or *Tefilloth*, Prayers; Jerome, *Liber Hymnorum*), the well-known canonical book generally ascribed to David. The single hymns contained in the book are variously designated either as 'Prayer' (Tefilla), as 'Praise' (Tehillah), or from some special characteristic 'Song' (Shir), or a song of deeper meaning, (Michtam), 'Instruction' (Maskil), or a dithyrambic poem (Shigayon). Respecting the general contents

of the book, it may be said that it comprises, in the form of pious lyrics, written for and on behalf of the congregation, the quintessence of the dogmatical, ethical, historical, and theocratical portions of the Old Testament. The divine essence and qualities, providence and its guidance—especially of Israel—the rule of the universe, the nature of the human heart and its relations to God and His revelation, the blessings of the theocratic community: these and similar reflections form the themes of its ever-varying modes. A certain more spiritual conception of the ordinances of the Pentateuch is visible throughout, and although the strictest adherence to these is enjoined, yet their deeper meaning is impressed more strongly still.

Used as a liturgical hymn book in the Temple, it has been bodily received for the same purpose in the Christian church; and certain additional hymns which occur in the Greek and Syriac Psalter have not been sanctioned by the authority of the general church. There are, in all, 150 canonical hymns or psalms, which, after the model of the Pentateuch, have been divided into five books—thus: i.—xli; xlii.—lxxii; lxxiii.—lxxxix; xc.—cvi.; and cvii.—cl. The Syriac, the LXX., and the Vulgate Versions differ in some respects in their counting. The Authorized Version, however, follows strictly the Masoretic Jewish text, except with regard to the numbering of the verses; for while the latter includes the superscriptions among the verses, the former does not reckon those. This division into five books is, as it is traditional, also the most natural; and the doxologies at the ends of psalms xli, lxxii, lxxxix, and cvi., further mark authoritatively the respective ends of the special divisions. A further division, or rather classification, has been attempted according to the contents; but, considering the constantly changing variety of moods and sentiments of manner and contents which these songs exhibit, it is a most precarious one.

The Psalms have generally—thirty-four only excepted—superscriptions more or less expressive of the contents of the special hymn, and sometimes with, sometimes without, the name of an author. In some, certain notes, referring to the musical and liturgical part, are added, which are far from being quite clear now, e.g., 'On the octave,' 'For the chief musician,' 'On Machalath' (illness?), 'In the time of death to the son,' 'The hind of Aurora,' 'Lilies,' 'Dumb dove of the far ones,' &c. One of the greatest puzzles is the word *Selah*, which occurs several times at the end, or in the middle of some psalms, and which the LXX. render *Diapsalma*, 'Interlude,' but about the real signification of which, numerous yet very unsatisfactory suggestions have been made at various times. Thus, it has been identified with *amen*, *hallelujah*, *piano*, &c. So much seems certain, that it was a kind of catchword or sign for the performers. These headings belong very probably to the individual poets themselves, and not to the collectors, as has been surmised.

The authorship of the Psalms is described by the headings of the various chapters as follows: Psalm xc.—one of the most ancient in form and contents—is attributed to 'Moses, the man of God.' Seventy-three psalms are inscribed with David's name; two with Solomon's; twelve with that of Asaph, the Levite and singer, of which five, however, belong to the times of Jehoshaphat, Hezekiah, and the beginning of the Babylonian exile respectively. Eleven psalms go under the name of the Sons of Korah, or the Korahites—a family of singers descended from the Levite Korah, known from the Pentateuch. Their head at the time of David was Heman. Part of these psalms belongs to the time of David; others, to that of Solomon, and others are of an uncertain later period. Respecting the psalm inscribed 'Prayer of Moses,' there seems, indeed, to be no valid reason against its authenticity; it is quite worthy of the great legislator, and to a certain extent similar to other compositions of which he is reasonably regarded as the author. The numerous body of psalms attributed to David, manifest (those at least which can fairly be believed to be his work) a vivid and profound feeling and rare poetical gifts. The singer abandons himself entirely to whatever feeling of joy or grief, repentance or revenge, piety or despair, sweeps over his soul. This also accounts to a certain extent for the violent manner in which he calls down at times the vengeance of God upon the heads of his adversaries; while at others, he humbles himself to the dust on account of his own iniquities. On his style and manner, we cannot enlarge here; suffice it to add, that his lyrics have deservedly been counted among the gems of all human literature for well-nigh 3000 years—quite apart from their sacred liturgical character. Asaph's psalms show their author to have been a didactic poet of high order; but, as we said before, many of those ascribed to him belong to poets later than the schism, and even posterior to the Exile. The Korahite hymns, although all more or less fraught with the same depth of feeling, the same conciseness, the same grandeur and lyrical exaltation, exhibit signs of being written partly during the time of Solomon, or even during the Exile.

Of the anonymous psalms, some may fairly be added to the number of those that issued from the hand of the royal singer

himself; others, however, belong to the post-exilian times. Some of these (the hallelujahs, for instance, or the 'Songs of Degrees') were, in all probability, pilgrim-psalms, chanted during the ascent to the sanctuary. Whether other psalms belonging to the Maccabean period or not—a question hotly disputed—we cannot discuss here.

There is a great deal in favor of the opinion that the collection and redaction of the book, such as we have it now, is owing to one man, who arranged the single hymns according to their contents and tendency. Thus, following all the while the law of analogy, the redactor gave the first place to David's and his contemporaries' (Asaph, Ethan, Heman) compositions. These were further classified according to the prevalent use of the peculiar divine name (Jehovistic and Elohistie), and were divided into three books—the first of which contains the Davidic Jehovistic psalms; the second, the Elohistie ones of the Korahites, of Asaph, David, Solomon, and some unknown poets; the third, the rest of Asaph's and the Korahite psalms of a mixed (Jehovah-Elohistie, or purely Jehovistic) nature. The arrangement within these larger classes was made, again, according to the inner nature and relation of these hymns to each other, and by a certain likeness in phraseology, similes, &c. Psalms i. and ii. were then prefixed, on account of their general introductory matter and manner. The same laws have also been followed in the remaining portions of the collection.

It is difficult to fix the period of the redaction. Assuming, however, the collecting and editing to be the work of one man, he could not possibly have lived before the time of Nehemiah, even according to those who affirm the non-existence of Maccabean psalms in our canon. If, on the other hand, various single collections are assumed, out of which our present book has grown, there is no reason why some of those should not be placed at a much earlier date. We forbear to add a list of writers on the subject of psalms. Nearly all the principal authorities in biblical literature, in the Jewish, Roman, and Protestant churches, have contributed their share towards the elucidation of the Psalms; and to the individual works of the chief biblical commentators, the reader is referred for special information. Le Long, in his *Bibliotheca Sacra*, enumerates more than 500 commentators on the Psalms, and Calmet carries the number up to a thousand. Of these, some are very voluminous, that of Le Blanc filling no fewer than six folio volumes.

PSAMME'TICHUS, the name of three kings of Egypt, of the 26th dynasty, distinguished on the monuments by different pronouns, and of two other persons of ancient history. The first and most notable P. was the son of Necho I. After the defeat and death of his father, he fled into Syria, and thence, by means of foreign aid, appears to have established himself as one of the twelve monarchs who then reigned over Egypt, with the rest of whom he was connected in a kind of federation. An oracle having declared that the monarchy of the whole country should go to that one who made a libation out of brass, P. fulfilled the condition by pouring it out of a brazen helmet. By the answer of another oracle, he was told that he should succeed by means of brazen men who would appear from the sea. Some Carian and Ionian pirates who appeared soon after in panoplies of brass on the shores of Egypt, answered the response of the oracle.

P. engaged them in his service, and by their means finally subdued his rivals at Momemphis, after a struggle of fifteen years' duration. He strengthened his power by employing Greek mercenaries, whom he settled at Daphnon and Pelusium, to protect the eastern borders of Egypt, and whose headquarters were subsequently transferred to Memphis. To them he assigned the right wing, or post of honor, in the army—their arms and discipline being far superior to that of the native troops. This proceeding gave great disgust to the Egyptian army, and on his refusing to send the Greeks home, after their term of service, the Elephantine garrison, of 240,000 men, deserted the country, and marched into Ethiopia beyond Meroë. Although exhorted, they refused to return. To protect Egypt from the Syrians, he besieged Azotus, which he finally took, after 29 years' siege. P. fostered in every way the Greek influence in Egypt, divided amongst them lands, encouraged the study of the language, and contracted alliances with the Athenians. He also facilitated the commerce, and opened the ports which had been hitherto closed. Under P., the arts revived, the sculpture and architecture imitated the older prototypes, and the government was remodelled on the plan of the ancient dynasties. In literature, a new handwriting, the demotic, was introduced. Egypt, however, had fallen into a national decadence, and its own polity and institutions, subverted by the foreign influence prevalent in the country, could not be restored. P. reigned, according to Manetho, 54 years; his reign closed about 609—610 B.C. The other personages of this name are of little importance.—Herodotus, ii. 154; Pliny, *Nat. Hist.* vi. 35; Diodorus, i. 67; Champollion-Figeac, *L'Egypte*, pp. 367—370; Sharpe, *Hist. Egypt.*, p. 58.

PSEUDOSCOPE *pseudos*, false, and *skopein*, to see), an optical instrument invented by Professor Wheatstone, and so called from the fact of its exhibiting objects viewed through it, under aspects the exact converse of their natural appearance. Its construction is shown by the annexed figure: *abc*, two rectangular prisms of flint-glass, the hypotenuses of which measure $1\frac{1}{2}$ inch in length, and $1\frac{1}{2}$ inch in depth. The prisms are hinged at *c*, so that they may be inclined towards each other in any desired degree, and are fixed each in a wooden framework, fastened together by the hinge or pivot *d*. By means of the pivot *d*, the distance between *c* and *c* may be made to accommodate itself to the different interval between the eyes in various observers. In using the instrument, the eyes are placed at E and E respectively. The thumb-pieces attached to the prisms at *a* and *a*, are used in

adjusting the instrument for distinct vision of any particular object. The optical effect of each prism is twofold: it displaces the object, and it procures the lateral inversion of the image. From the latter circumstance, it follows that the right-hand side of a cube, for example, is seen on the left, and *vice versa*; this inversion being occasioned by the reflection of the rays upon the side of the hypotenuse within each prism. By the two refractions undergone by the rays as they enter and leave the prisms, the axis of the emergent pencil is no longer directed towards the real place of the object, but is diverted in such sort that the convergence of the optic axes diminishes as the distance of the object diminishes; and increases as its distance increases—a complete reversal of the ordinary conditions of sight, and one which, in conjunction with the lateral inversion before mentioned, gives rise to very curious visual phenomena. See VISION. It is essential to the efficient use of this instrument that the object be seen by both eyes; and therefore the observer, having placed the object at the usual distance for distinct vision, should, by closing the eyes alternately, ascertain that it is within the field of each prism. He should then adjust the prisms until the two images coincide in point of space, when they will coalesce, and, at first, the object will probably retain its natural aspect; but on a sudden, it undergoes a change, and the converse appearance stands out to view with the utmost distinctness and reality.

A hat will appear to be turned completely inside out; the interior of a basin will appear convex and protruding; and 'a bust regarded in front becomes a deep hollow mask.' To facilitate the illusion, the object should be equally illuminated on either side, so as to prevent shadows.—For a full account see, the original paper by Wheatstone, *Phil. Trans.*, 1852, p. 11, *et seq.*

PSI'DIUM. See GUAVA.

PSITTA'CIDEÆ. See PARROT.

PSKOV (Ger. *Pleskau*), a government in the north-west of European Russia, lies south of the governments of St. Petersburg and Novgorod. Area, 17,045 sq. m.; pop. (1870) 775,701, almost all Russians, except in the western districts, where there is a small number of Finns. The climate is temperate, the surface is hilly in the west, and the soil is of average fertility. Lake Pskov and Lake Ilmen receive almost all the drainage of the government, the river Velikaia falling into the former, and the Sheon, the Polista, and the Lovat into the latter. The rivers are navigable for rafts, and, nearer their mouths, for barges and ships. Lakes abound in the eastern and south-eastern districts. Agriculture is the staple employment; flax-growing being the most remunerative branch. The manufactures carried on in the government are inconsiderable. The St. Petersburg and Warsaw Railway, by which ready access is afforded to the metropolitan market for the agricultural productions of P., has exercised a most beneficial influence in developing the industry and resources of the government.

PSKOV, a town in the north-west of European Russia, capital of the government of the same name, stands on the banks of the Velikaia, 180 miles south-south-west of St. Petersburg by railway. During the 14th and 15th centuries, it made one in the confederation of the Hanse Towns, and had then a population greater than at present. In 1510, it was annexed to the kingdom of Moscow. During the wars with Lithuania, P. was a stronghold of great importance. It contains a cathedral, 42 churches, and 4 monasteries. Fish, obtained from Lake Peipus, and flax, are the principal articles of a foreign commerce which is not extensive. Pop. (1867) 12,981.

PSORA'LEA, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having the calyx permanent after flowering, and its tube sprinkled with cillious points; the legume one-seeded, sometimes ending in a beak. The flowers are blue, purple, or white. The leaves are of various forms, but in general abruptly pinnate. Some of the species are natives of India; others of other warm countries.—*P. esculenta*, the **BREAD-ROOT** of North America, and *Prairie Apple* of the Canadian boatmen, is an herbaceous perennial, about a foot high, with a carrot-like root, swollen above the middle, and abounding in farinaceous matter. It is used as an article of food, both boiled and raw. In Britain, it requires the protection of a frame, in order to produce an abundant crop or large roots.

PSORI'ASIS (from the Greek word *psora*, which signifies a cutaneous eruption, supposed by some to be the itch) is now employed to signify a disease characterized by slight elevations of the surface of the skin covered with whitish scales. There are various forms of this disorder, such as *P. guttata* (which is the simplest kind, and derives its specific name from the scales not coalescing, but remaining distinct, like isolated drops of water on the skin); *P. diffusa*, when the disease spreads over large portions of the skin, and often renders the patient hideous to look at, the scaly incrustations being often interspersed with bleeding cracks and fissures in all directions; *P. inveterata*, which is merely the severest phase of the preceding form, and occurs chiefly in aged persons of broken-down constitution; and *P. gyrata*, a rare form, in which the disease occurs in narrow stripes or rings. The causes of psoriasis are very obscure. It is certainly not contagious, but there appears to be in some families an hereditary tendency to it. It is occasionally associated with gout and rheumatism. Persons of both sexes, of all ages, and of all conditions of life, are liable to it, although it is more common in middle and advanced life than in childhood. The treatment varies with the condition of the patient.

A middle-aged, vigorous patient should be purged two or three times a week with sulphate of magnesia, should be restricted in his diet to vegetables and milk, should be debarred from all stimulants, and should take a warm bath daily. The internal remedies of most repute for this disease are—1. Decoction of dulcamara, from half a pint at first to a pint being taken in divided doses through the day; 2. Liquor potassæ, in doses of from half a drachm to a drachm, three times a day, in a glass of milk or beer; 3. Liquor arsenicalis, in doses of from three to four minims, three times a day, to be taken after meals; 4. Iodide of potassium, in five-grain doses, three times a day; and 5. Pitch pills. In very inveterate cases, tar ointment, first diluted with lard, or a weak ointment of iodide of sulphur, should be applied locally; but these should not be tried unless internal treatment fails.

PSY'CHÉ (Gr. breath, or soul), a creation of the later mythology of Greece, or perhaps we should rather say, a personification of the human soul, devised by the later poets. Apuleius (q. v.) relates the following story about her, which is obviously allegorical. P. was the youngest of three daughters of a king. She was so exquisitely beautiful that mortals mistook her for Venus, and did not dare to love, but only to worship her. This excited the jealousy of the goddess, who sent Eros (Cupid) to inspire P. with a passion for the most contemptible of all men; but Eros was himself wounded as deeply by her glances as ever he had wounded others with his darts. Meanwhile, P.'s father wished to see his daughter married, and inquired about her at the oracle of Apollo, by whom he was told to bear the maiden in funeral robes to the summit of a hill, and to leave her there alone, as she was destined to be the bride of a huge all-destroying snake monster, that terrified both gods and men. Amid loud wailing and lament, P. was borne to the fatal spot, and left trembling in horrible solitude, when suddenly a light-winged zephyr flew round her, and bore her off to a beautiful palace of pleasure belonging to Eros, who visited her, unseen and unknown, every night, and left her before morning broke. Here P. would have enjoyed perpetual delight, had she remembered the advice of her unknown lover, who warned her not to seek to know who he was. But her jealous sisters, whom against Eros's injunction, she had allowed to visit her, working upon her curiosity, persuaded her that she was embracing a monster in the darkness of night; and having lighted a lamp when Eros was asleep, she saw with rapture that she was the mistress of the most handsome of gods. In her excitement, she let a drop of hot oil fall on the sleeper's shoulder, who awoke, upbraided her for her mistrust, and vanished.

P. gave way to the most passionate grief; she even thought of drowning herself. After wandering about for some time, she came to the palace of Venus, where she was seized by the goddess, and kept as a slave. Eros, however, who still loved her, invisibly helped and comforted the hapless maiden, reconciled her to his mother, and was finally united to her in immortal wedlock. All critics have agreed to consider the story an allegory of the

progress of the human soul through earthly passion and misfortune to pure celestial felicity.

PSYCHO'LOGY. See **MIND**.

PTA'RMIGAN (*Lagopus*), a genus of *Tetraonidæ*, differing from the true grouse (q. v.) chiefly in having the toes thickly clothed with short feathers as well as the legs (*tarsi*). Hence the name *Lagopus*, a name used by Pliny from the resemblance of the foot to that of the hare. The bill is very short, and clothed at the base with feathers. The species are natives of the northern parts of the world, and either of elevated or of strictly arctic regions

Common Ptarmigan (*Lagopus mutus*).

They are not polygamous, like the true grouse, nor do the males strut with erected and expanded tail. Most of the species change color very much on the approach of winter, assuming a white, or nearly white plumage; and the diversities of color have caused some confusion and difficulty concerning them. They are all much esteemed for the table. The **COMMON P.**, or **GRAY P.** (*L. vulgaris* or *L. mutus*), is a native of the most northern parts both of the Old and New Worlds. In Britain, it is now seldom seen much further south than the Grampians, and occurs only on high mountains. It was formerly an inhabitant of those of Cumberland and Wales. It is not found in Ireland. It is abundant in Norway, from which great numbers are annually brought to the London market.

In arctic countries, the haunts of the P. are not mountain-tops, but low valleys and plains even to the sea-shore. In form and habits, it much resembles the Moorfowl (q. v.), but is rather smaller. The winter plumage is pure white, except a black band above the eye of the male, and some parts of the quill and tail feathers. The summer plumage is as beautifully adapted to the concealment of the bird from enemies, by its harmony with the general aspect of the ground, as that of winter; the male being mostly brownish-gray, with undulating lines of black; the wings, middle-tail feathers, and under parts of the body, white; the female similar, but with a prevalent yellow tinge. The plumage, however, varies very much, according to age, sex, and the season of the year. Ptarmigans seem to trust very much for safety to the facility with which they are able to elude observation, whether among the snows of winter or the lichen-covered rocks in summer, and an unaccustomed sportsman is often startled by a covey springing up close beside him, of which he had not previously observed one. The P. is capable of being tamed, and has even been found to breed in confinement. The voice of the P. is a low croaking cry. The name P. is a modification of the Gaelic name. The *Rock P.*, said to occur in the north of Scotland, and to be common in Norway, seems to be merely the common species in a particular state of plumage.—The Moorfowl (q. v.) is a species of Ptarmigan.—Another is the **WILLOW P.**, or **WILLOW GROUSE** (*L. salicetæ*), of the northern parts of the world, abundant in the arctic parts of America, and in Norway, from which great numbers are brought to the London market. Its summer plumage much resembles that of the moorfowl; but its winter plumage is white. It does not inhabit regions so cold and lofty as the common P., but loves thickets of willow and dwarf-birch. It is found in Europe as far south as the valleys of the Alps. In North America, it is partially migratory.—There are other species in Siberia, Iceland, the Rocky Mountains, the mountains of Mexico, &c.

PTERICHTHYS (Gr. wing-fish), a genus of ganoid fishes, peculiar to the beds of the Old Red Sandstone measures. Fragments of the bony case had been found in Russia as early as 1818; in 1840, they were described as belonging to a fish to which the generic name *Asterolepis* was given. In the same year, the late Hugh Miller exhibited to the members of the British Association

the first specimen which gave an idea of the form of the fish, and to this Agassiz applied the generally-received name of P., from the wing-like appearance of the pectoral spines.

The head and anterior part of the body were covered with hard ganoid plates, fitting closely to each other and forming a strong protecting case. The remainder of the trunk was flexible, and covered with small scales. The fish was furnished with a small dorsal fin, and the body terminated in a heterocercal tail; but

Pterichthys Milleri (Dorsal Surface).—From Owen.

neither of these, from their soft texture, is common in the fossil specimens. The creature was not fitted for rapid motion. The pectoral spines, which were at first erroneously supposed to be fins, were more probably used as weapons of defence, and perhaps they were also of service in assisting the P. to move along the sandy bottoms on which it lived. The spines were composed of two segments, and were covered with tubercles like the trunk. Twelve species of the genus have been described.

PTEROCLES. See GANGA.

PTERODACTYL (Gr. wing-finger), a remarkable genus of fossil lizards, peculiar to the Secondary strata. Its anomalous structure was long a puzzle to comparative anatomists. Blumenbach considered it a palmpede, or web-footed bird; while its original describer, Collini, and other more eminent naturalists, referred it to the mammalia, finding its nearest ally in the bat. The careful investigations of Cuvier, however, showed that the P. was a true lizard, but possessed of the power of flight, which it performed, not by a membrane stretched over its ribs, like the living dragons, but more as in the bats, except that the wing was attached, not to several, but only to a single finger—the fifth—the others being free and short. The bones of the fifth finger were very greatly elongated, and the last joint terminated in a long, slender, unguated apex; the terminal joints in the other fingers were furnished with strong claws. Mantell thus graphically describes the genus: 'With a long-snouted head and long neck much resembling that of a bird, bat-like wings, and a small trunk and tail, with lacertian affinities in its skull, teeth, and skeleton, and with a bird-like structure of sternum and scapular arch, these creatures present an anomaly of structure as unlike their fossil contemporaries as the duck-billed ornithorhynchus of Australia to living mammals. The cranium is small; the jaws are long, and either armed with numerous, sharp-pointed teeth, or toothless, like those of a bird. The eye-orbit is very large; the scleroticæ consists of a ring of bony plates, and the nostrils are placed near the orbits. The cervical vertebræ are large and strong, and capable of great flexibility backwards and forwards, probably to allow the head to fall back to the center of gravity during flight. The dorsal vertebræ are from 17 to 20 in number.

The sacrum is formed by the coalescence of two vertebræ only, as in existing reptiles, and not of many, as in birds and certain extinct saurians. The tail is generally short, an unusual character with saurians; but a species with a long tail occurs at Solenhofen. There are five toes or digits on each foot; the outer finger of the forearm is immensely elongated for the support of a mem-

branous expansion (the impression of which is preserved in some instances); and the other digits of fore and hind feet terminated in long curved claws. The size and form of the extremities show that the Pterodactyl was capable of perching on trees, of hanging against perpendicular surfaces, and of standing firmly on the ground, when, with its wings folded, it might crawl on all-fours, or hop like a bird.' The famous quarry of lithographic stone at Solenhofen, of Upper Oolite age, has supplied a great variety of these flying lizards; but the largest species have been found in the Secondary beds of this country. In the Upper Greensand, at Cambridge, the remains of a species that must have had a spread of wing of 25 feet across, have been found; and in the Kentish Chalk, another has been met with very little short of this in its dimensions. The various species vary as much in structure as in form, so that the original genus has been lately raised to the position of an order, under the name of PTEROSAURIA, and the species have been arranged under the following genera, characterized principally by the structure of the jaw and teeth: *Pterodactylus*, in which the jaws are furnished with long slender teeth along their whole length; *Rhamphorhynchus*, with the extremities of the jaws smooth; probably furnished when living with a horny bill, and towards the bases of the jaws having four or five strong teeth; and *Dimorphodon*, with large strong teeth in front, and small shorter ones behind. Nearly 80 species have altogether been described.

PTEROMYS. See FLYING SQUIRREL.

PTEROPODA (Gr. wing-footed), a class of molluscs, having for their only organs of locomotion wing-like fins attached to the sides of the head or neck, one to each side, by which they make their way through the water, flapping them as a bird or an insect does its wings in the air. They are allied to *Gasteropoda*, but are inferior to them in organization; and their wings are not at all homologous to the foot of that class. They are hermaphrodite. The head is perfectly distinct in some, but obscurely distinguished from the body in others. Those which have the head most distinct, as *Olio* (q. v.), have no shell, and form the order *Gymnosomata*; those with the head indistinct, the order *Thecosomata*, have a thin external shell, which in some is globular, with slits for the wings to pass through, in some triangular and pyramidal, in some conical, in some slipper-shaped, &c. All the species are marine; they are small and delicate creatures, very lively and active, always in quest of food, and affording food to fishes and cetaceans. They are found in all parts of the world, some of them in immense numbers in tropical, and some in arctic seas. None of them are common on the British coasts. The genera and species are few.

PTOLEMAIC SYSTEM of Astronomy, so called from Ptolemy (q. v.), its chief expounder, was originated, however, long before his time, and was, in fact, merely an attempt to reduce to a scientific form the common and primitive notions concerning the motions of the heavenly bodies. It was implicitly adopted by Plato, Aristotle, Hipparchus, and (with the exception of the Pythagoreans, and probably of Pythagoras himself) all the eminent physicists and philosophers of ancient times; passing from them to the Byzantines and Arabs, who, especially the latter, were the means of disseminating it through Western Europe, where it continued to be the universally established doctrine till the 16th century. The primary and fundamental doctrines of this system are that the earth is the center of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having, previous to any accurate observation, established themselves as unquestionable axioms, phenomena which were found, on closer examination, to be inconsistent with them, were explained by the introduction of additional hypotheses.

The belief that the earth is the center of the universe, was supported by its being in accordance with the relation of the primary elements of which the material world was supposed to be composed. Thus, earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, ether being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest enclosing the earth and its superincumbent elements, and the larger spheres enclosing the smaller. To each of these spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the Sun, Mars, Jupiter, Saturn, and the fixed stars, eight in all. To this system, later astronomers added a ninth sphere, the motion of which should produce the precession of the Equinoxes (q. v.), and a tenth, to cause the alternation of day and night. The tenth sphere, or *primum mobile*, was supposed to revolve from east to west in 24 hours, and to carry the others along with it in its mo-

tion; but the Ptolemaic astronomers do not venture to explain how this was done, although since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens became increased in accuracy, it was

found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit, is only apparent, and results from the earth not being in the center of his sphere, C (see fig.), but at E, and consequently his motion appears to be slowest at P, and quickest at R.

The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystallines, but in a small circle, whose center was a fixed point in the crystalline, and which revolved on its axis as it was carried round with the latter; thus (fig.) the planet was carried round the small circle ABD, as that circle was carried round PQR (now supposed to represent the planetary crystalline). The planet, while in the outer portion of its small circle, would thus have a forward, and in the inner portion a backward motion. The larger circle was called an *eccentric*, and the smaller an *epicycle*. This theory of eccentrics and epicycles satisfied the early astronomers; but further investigations showed its incompleteness, and in later times it was found necessary to explain newly-discovered discrepancies by heaping epicycle upon epicycle, till such a complication of the system had been produced, as drew from Alfonso X. of Castile, to whom the P. S. was being explained, the humorous though somewhat blasphemous remark, that 'if the Deity were now to reconstruct the world, he (Alfonso) could give him a few useful hints.' As soon as astronomers came to understand and test the *Copernican Theory* (q. v.), the venerable and disorderly pile of hypotheses, the then representative of the P. S., which had received the papal seal of infallibility, and had in various forms held supreme sway over the minds of men for twenty centuries, at once crumbled to atoms, and sunk into oblivion.

PTOLEMAI'S. See ACRE.

PTOLEMY I., son of Lagus, is also known by his surname **SOTER**, or the Preserver. He was believed by some to be the son of Philip of Macedon, because his mother, Arsinoë, had been a concubine of that king, his father being a Macedonian of humble station. P. acted as one of Alexander's generals in his eastern campaigns; and when the possessions of the great conqueror was divided, after his death at Babylon, 323 B.C., Egypt fell to the lot of the son of Lagus. Troubles soon followed such an acquisition; but P. was a man of energy and valor, and not only warded off danger from his own realm, but also extended his dominions by the addition of Phœnicia and Cœle-Syria, capturing Jerusalem, too (most probably in this expedition), by assaulting it on the Sabbath-day. In 316 B.C., war again broke out between P., Lysimachus, and Cassander on the one hand, and Antigonus on the other. (See these names.) It lasted till 301 B.C.; and at its conclusion P. was left in possession of almost the same territory as he ruled at its commencement, with the exception of Cyprus, which, by the naval battle off Salamis in that island (306 B.C.), was gained by Antigonus. P., however, recovered Cyprus in 295 B.C., and in was thereafter attached to the Egyptian kingdom. After said battle of Salamis, 306 B.C., Antigonus assumed the title of king, which example P. and the other successors of Alexander followed. In 305 B.C., P. compelled Deme-trius, the valiant son of Antigonus, to raise the siege of Rhodes, for which deliverance the Rhodians were so grateful that they worshipped him as a deity, and conferred on him the title of *Soter*, or Preserver. The latter part of his reign was peace. He governed his kingdom with an enlightened and vigorous policy, and so laid the foundation of that prosperity which Egypt enjoyed for many succeeding generations. He encouraged commerce, and soon made Alexandria the great mart of the Mediterranean. He fostered literature, science, and art; and not only founded the famous Museum and Library of Alexandria, but also entertained at his court the votaries of the Muses; Euclid, the geometrician; Stiplo, the philosopher; Philetas, the elegiac poet; Zenodotus, the grammarian; Antiphilus and Apelles, the painters; with

many others. The history of Alexander's wars, by P., is the basis of Arrian's work on the same subject. Two years before his death, which occurred in 283 B.C., he abdicated in favor of his son, Ptolemy Philadelphus. His reign extended from 323 to 285 B.C.

PTOLEMY II., surnamed **PHILADELPHUS**, was the son of Ptolemy I. and Berenice. He was born 309 B.C., in the island of Cos. His reign is remarkable rather for the successful cultivation of the arts of peace than of the practice of war. Excepting a contest with his half-brother, Magas, for the province of Cyrene, his wars against Syria are almost the only military exploits which interfered with the prosecution of those designs for the improvement of his kingdom, which have rendered his name famous among wise and enlightened sovereigns. He carried on, with even increased zeal, the good work which his father had begun. He enriched the library of Alexandria with all the literary treasures of his own and of earlier times, and the museum was crowded with the learned from all countries—with such men as Theocritus and Philetas, the poets; Euclid, the geometrician; Aristarchus and Aratus, the astronomers; Theodorus and Hegesias; the philosophers; and many more. Tradition alleges that it was by his orders the Hebrew Scriptures were translated into Greek, and the version called the 'Septuagint' (q. v.) thus formed. He induced Manetho to write in Greek, a political history of Egypt, and an account of the religious tenets of the Egyptians. He encouraged the study of natural history; and to facilitate the pursuits of those who devoted themselves to it, he formed a collection of rare and curious animals in the preserves, which we may call the 'Royal Zoological Gardens' of Egypt. He founded many colonies in those parts of the empire which seemed specially suited to become centers of trade and of enlightenment, and thus spread more widely the seeds of civilization and Greek culture; among these was Ptolemais (Acre), in Palestine. He ruled over Egypt, Phœnicia, and Cœle-Syria, Lycia, Caria, Cyprus, and the Cyclades, with parts of Arabia, Libya, and Ethiopia. His son Ptolemy married Berenice, the daughter of Magas, and the province of Cyrene was thus peacefully brought back to his empire. Under P. Philadelphus, Egypt rose to a high rank among the nations in power and in wealth. The surname of Philadelphus was assumed by P. to indicate his great affection for his sister Arsinoë, whom he married after the death of her husband, Lysimachus. His former wife, Arsinoë, daughter of Lysimachus, was banished by him; and two of his brothers were put to death.

It is with reference to this last circumstance that some have explained the name Philadelphus, as in irony. By his first wife, he had two sons, Ptolemy, his successor, and Lysimachus; and one daughter, Berenice, married to Antiochus II., king of Syria. He reigned from 285 to 247 B.C.

PTOLEMY III., surnamed **EUERGETES**, succeeded his father Philadelphus, and reigned from 247 to 222 B.C. He made war on the kingdom of Syria, to avenge the death of his sister Berenice, who had been murdered at the instigation of Laodice, former wife of Antiochus. He overran all the provinces as far south as Babylon and Susa; those on the north and east as far as Bactria and India, offered him homage; and he might have extended the bounds of his empire much farther, had not domestic troubles compelled him to hasten back to Egypt. The treasures he brought with him were immense; and among the things most highly prized were the statues of the Egyptian gods which Camby-ses had carried off to Babylon in 525 B.C. It was the restoration of these to their proper temples which gained for P. the title of Euergetes (the Benefactor). His fleets gained many possessions on the coast of the Mediterranean, such as Pamphylia, Cilicia, and Ionia, which remained for a long time subject to Egypt, though the eastern provinces recently conquered soon returned to their former sovereign. He pushed the limits of the home-empire further south, by conquering part of Ethiopia, where he formed a colony and center of trade at Adule. P., like his predecessors, patronized learned men, and encouraged the study of the arts and sciences. He added so largely to the library of Alexandria that he has by some been called its founder. Among the celebrated men who adorned his court, and kept up the fame of the 'Museum,' were Apollonius, Rhodius, Eratosthenes, and Aristophanes, the grammarians. In his reign, the Egyptian kingdom reached the highest point of military glory, prosperity, and wealth.

PTOLEMY IV., surnamed **PHILOPATOR**, reigned from 222 to 205 B.C. He was the unworthy son of the preceding king. His reign began in blood by the murder of his mother Berenice, his brother Magas, and his uncle Lysimachus; and it ended in blood by the violent death of his wife Arsinoë. He abandoned himself to debauchery, and intrusted the management of his kingdom to favorites. Antiochus, king of Syria, profiting by his indolence, wrested from him in war some of the provinces which his father had gained; but P., at length roused from his lethargy, took the field in person, and defeated Antiochus at the battle of Raphia.

When peace was concluded, P. returned to his capital, and plunged with increased zest into every vice and indulgence. He died in 205 B.C.; his death being hastened by his excesses. He followed the example of his father and grandfather in patronizing arts and letters, and cultivated friendship with the Romans, to whom he sent large supplies of grain during the second Punic War, but persecuted the Jews, against whom he had conceived a hatred in consequence of being refused admittance to the sanctuary at Jerusalem by the high priest.

PTOLEMY V., EPIPHANES, succeeded to the throne of his father Philopator, when only five years of age, and reigned from 205 to 181 B.C. His dominions were invaded by Antiochus, king of Syria, and Philip, king of Macedonia, while he was still an infant, and several provinces were severed from the Egyptian kingdom; but the Romans at length interfered, and peace was concluded, it being arranged that P. should marry Cleopatra, daughter of Antiochus, and receive as her dowry those parts of his empire in Syria which had been taken from him. He was declared of age in 196 B.C., and his coronation was performed with unusual splendor. The decree published on this occasion is that which forms the inscription on the far-famed Rosetta Stone (q. v.). P. married Cleopatra in 193 B.C. The affairs of the kingdom were managed by the wise and virtuous Aristomenes, and so long as P. followed his counsels, all went well. But the king's ear was gradually opened to insinuations against his great minister, whom he ultimately compelled to drink poison. While P. was preparing for an expedition against Syria, he was poisoned by some of his followers, whom he had alarmed for their own safety. Under him, Egypt rapidly sank in prosperity, power, and reputation.

PTOLEMY VI., PHILOMETOR, reigned from 181 to 146 B.C. He was very young at his father's death, and the affairs of the kingdom were therefore directed by his mother Cleopatra, who acted with remarkable prudence and energy. When she died in 173 B.C., the administration fell into the hands of two worthless ministers, Euleus and Leneus, who, engaging in war with Antiochus, brought the kingdom to the brink of ruin. The young king was taken prisoner by Antiochus (170 B.C.), who hoped to obtain possession of the whole of Egypt; but his younger brother, also called Ptolemy, immediately declared himself sovereign under the title of Euergetes II., and took vigorous measures to defend the kingdom. By the intervention of the Romans, Antiochus was compelled to return to his kingdom. The brothers reigned jointly for some time, but at length quarrelled, and a civil war ensued in which Euergetes II. was ultimately worsted. The deputies of the Roman Senate, who now did as they pleased in Egypt, arranged that P. Philometor should retain Egypt proper, while Euergetes II. should obtain Cyrene as a separate sovereignty. This settlement substantially held during the lifetime of the former. P. reigned 35 years, and died in 146 B.C., from injuries received by a fall from his horse in a battle against the Syrian usurper Alexander Balas. He is celebrated for his mild and humane disposition, which was strikingly evinced in his magnanimous treatment of his unworthy brother.

PTOLEMY VII., or EUERGETES II., best known by the nickname PHYSCON, or *Big-belly*, ascended the throne after the death of his brother. He married his brother's sister and widow, Cleopatra (who was also his own sister), and on the same day murdered her infant son P. Eupator, whom she had at first declared king. The history of his reign is one unbroken record of murder and blood, whence his subjects nicknamed him *Kakergetes* ('the malefactor'). Not only relatives who stood in his way to the throne, but those who opposed his accession, and even innocent persons, were butchered with savage cruelty. His private vices and debaucheries were equally infamous. He divorced his wife and sister Cleopatra to marry her daughter by her first husband—his own brother; and when temporarily driven from his throne, 130—127 B.C. by the indignation of his subjects, who chose the divorced Cleopatra in his room, the monster took a diabolical revenge by murdering his own and Cleopatra's son, and sending the head and hands as a present to the latter on her birthday. One is almost ashamed to add that he retained the hereditary taste for learning, and patronized learned men. He himself wrote a work of 24 books, called *Memoirs* (*Hypomnemata*). He reigned from 146 to 117 B.C.

Besides these, there are several Ptolemies of less note—as, for example, PTOLEMY VIII., or SOTER II., otherwise called LATHYRUS or LATHURUS, who reigned first from 117 to 107 B.C., and again from 89 to 81 B.C.; also PTOLEMY IX., or ALEXANDER I., youngest son of Ptolemy VII., who reigned from 107 to 90 B.C.; PTOLEMY X., or ALEXANDER II., son of Alexander I., 81—80 B.C.; PTOLEMY XI., or DIONYSUS, or AULETES, an illegitimate son of Ptolemy Lathyrus, who reigned from 80 to 51 B.C.; PTOLEMY XII., who reigned for some time in conjunction with his sister Cleopatra, and who was ultimately drowned in the Nile, after being defeated by Cæsar; and lastly, PTOLEMY XIII.,

younger brother of the preceding. Cæsar appointed him joint ruler with Cleopatra, his sister and intended wife. He died by violence in 43 B.C., at the instigation of Cleopatra.

PTOLEMY, a celebrated astronomer and geographer, whose proper name is CLAUDIUS PTOLEMÆUS, was a native of Egypt, though it is uncertain whether he was born at Pelusium or Ptolemais in the Thebaid. Nothing is known of his personal history, except that he flourished in Alexandria in 139 A.D., and there is probable evidence of his having been alive in 161 A.D. The chief of his writings are *Megale Syntaxis tes Astronomias*, which, to distinguish it from the next-mentioned, was probably denominated by the Arabs *megiste*, the greatest, whence was derived the name *Almagest* (Arab. article *al*, the), by which it is generally known; *Tetrabiblos Syntaxis*, with which is combined another work, called *Karpos* or *Centiloquium*, from its containing a hundred aphorisms, both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; *Phaselsi aplanon as-teron kai synagoge epismaseion*, a treatise on the phenomena of the fixed stars, or a species of almanac; the *Geographike Hyphegesis*, his great geographical work, in eight books. The rest of his works are of inferior importance, and consist of descriptions of various kinds of Projections (q. v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*. Others of P.'s works have been lost, and it is still a moot-point whether or not they contained a treatise on Optics, as a Latin version of what is said to have been an Arabic translation of P.'s original treatise on that subject is still in existence.

P., both as an astronomer and geographer, held supreme sway over the minds of almost all the scientific men from his own time down till about the 15th c.; but, and in astronomy specially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy, he had the labors of Hipparchus to guide him; and, indeed, scrupulously distinguishes between Hipparchus's labors and his own. To P. belongs the invention of a planetary theory, the discovery of the moon's Evection (q. v.), and the singular distinction of being the sole existing authority on the subject of ancient astronomy. From this last mentioned fact, the system of astronomy which he sets forth in the *Almagest* received his name; and, as the *Ptolemaic System* (q. v.) obtained the homage of succeeding generations till the time of Copernicus. His great work, the *Almagest*, is divided into 13 books. P. seems to have been little of an independent observer, trusting implicitly to his predecessor, Hipparchus; but his geometrical powers were of a very high order, unless, as Delambre suggests, but with little probability, the elegant demonstrations here and there occurring in the *Almagest* were borrowed from other sources.

As a geographer, P. occupies a similar position to what he holds in astronomy; he appears before his readers as the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from P.'s writings, little is known. P. here appears to more advantage as an independent investigator, and his improvements and suggestions are at once more valuable and correct; but it is sometimes difficult to separate his data from those of Marinus. His geography is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to 12ths of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places—by latitude (*mekos*) and longitude (*platos*)—with the calculation of the size of the sphere of the earth, and of the extent of surface then known. He also describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He also constructed a series of twenty-six maps, together with a general map of the world, in illustration of his work.

The *Almagest* and the *Geography* were the standard text-books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the 15th c. showed its deficiencies. They have passed through numerous editions, the best of which are, for the *Almagest* and the most of P.'s minor works, that by Halma (Paris, 1813—16—19—20, quarto); and for the *Geography*, the Latin versions of 1482 and 1490, published at Rome, the *editio princeps* of the Greek text by Erasmus (Basel, 1538, 4to), and the Elsevir edition (Lugd. Bat. 1619, fol.). The catalogue of stars has been frequently reprinted separately, the last and best edition being that of Francis Baily, in vol. xiii. of the *Memoirs of the Royal Astronomical Society* (London, 1843.)

PTO'SIS (from the Gr. *ptipso*, I fall) signifies a drooping or falling of the upper eyelid, and arises from palsy of the third or motor oculi nerve. It may arise either from debility, in which

case it may be removed by tonics; or from congestion of the brain, when it is usually accompanied with giddiness, headache, &c., and should be treated by bleeding, purgatives, and low diet; or from organic disease of the brain, in which case remedies are of little use. If it occurs without any apparent cause, and resists medical treatment, it may be removed by a surgical operation, by which the eyelid is brought under the action of the occipitofrontal muscle, which receives its nervous power from another source.

PTYCHODUS, a genus of cretaceous fish, founded on large square crushing teeth, which occur in considerable quantity in the Chalk beds. The crown of the teeth are raised in the center into a number of parallel transverse ridges, and the flat margin is finely granulated. They were set, as in the Port Jackson shark, like a pavement on the borders of the mouth, and were admirably adapted to crush the shells of the crustacea and mollusca on which they fed. Large dorsal spines have been found associated with the teeth; but as no materials exist for the restoration of the external form of the fish, the analogy of their modern representative, the Port Jackson shark, alone suggests that they belonged to the Ptychodus.

PUBLICANI (from Lat. *publicum*, that which is public or belongs to the state), the name given by the Romans to those persons who farmed the public revenues (*vectigalia*). These revenues were put up to auction by the censors, and were 'sold' for a period of five years. They were derived chiefly from tolls, tithes harbor-duties, *scriptura* (the tax paid for the use of public pastures-lands), mining and salt duties. As the state required the publicani to give security for the sum at which they had purchased the collecting of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies (*societates*) were formed, the members of which took each so many shares and were thus enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Their contract with the Roman government was made in the name of a single person, who was called *manceps*, and who was held responsible for his *socii* to the state. Every *societas* had also a head-manager (*magister*), who resided at Rome, and transacted all foreign correspondence with the inferior officers who directly superintended the collection of taxes. In general, a *societas* farmed only one branch of the revenue, but exceptions occur. Only Roman citizens were eligible as publicani, and, as a matter of course, only the wealthiest among these could become such. After the middle of the 2d c. B.C., the farming of the public revenues fell into the hands chiefly of the Equites (q. v.). By a wise regulation, no governor of a Roman province was allowed, during the period of his governorship, to have anything to do with these tax-gathering companies. The design of this was to place the governor in such a position that he could afford to act justly towards the people, who were often cruelly oppressed by the exactions of the provincial underlings—the 'publicans' of the New Testament.

PUBLIC BURDENS is a phrase in Scotch law to denote the usual taxes or charges on land, in respect both of its ownership and possession. Such are the land-tax, minister's stipend, manse assessments, schoolmaster's salary, poor-rates, rogue-money, road and bridge assessments. Public burdens, where no stipulation is made to the contrary, fall upon the landlord, and not on the tenant, except in the case of schoolmaster's salary, which is equally divided between landlord and tenant.

PUBLIC HEALTH ACT is an important act in England regulating sanitary matters (11 and 12 Vict. c. 63). It enabled local boards of health to be created all over England. The initiative was given to one-tenth of the rated inhabitants of cities, boroughs, parishes, and places having a defined boundary, to take proceedings to have the act applied to their district, whereupon and so to deal systematically with sewerage, drainage, water-supply, paving, lighting, watching. The General Board of Health first send an Inspector to report, and afterwards direct the act to apply. The act has been further supplemented by a family of kindred acts called the Local Government Acts, the Nuisances Removal Acts, the Prevention of Diseases Acts, &c. The state of the law produced by these combined statutes is very complicated, but the result is greatly to extend sanitary improvement.

PUBLIC-HOUSES in England are known under two classes, viz., Ale-houses, also called Inns (q. v.), and Beer-houses. The former give board and lodging to travelers, while the latter are mere shops for the sale of beer to be consumed on or off the premises.—1. An alehouse must be first licensed by the justices, before the keeper of it can sell excisable liquors to be consumed on the premises. The granting of the license may be opposed by any inhabitant.

The justices' license, if new, must be confirmed by the confirming authority of other justices; and an excise license must follow, and not precede the justices' license. The license is in

force for one year; and if any offence or misconduct is committed, the renewal of the license may be opposed, and refused on the next meeting. The statute compels the keeper to keep unadulterated liquor, to use only legal measures, not to permit drunkenness or unlawful games, or bad characters, to keep good order, and lastly, not to open his house, except to travelers, on Sundays, during the morning and afternoon divine service. The law as to the opening of public-houses during Sunday may be varied by the country justices within certain narrow limits, and is as follows: No public-house can be opened for the sale of fermented or distilled liquors before half-past 12 at noon on Sunday, or in London before one, or elsewhere before one if so ordered. It must be again shut between 3 and 6 P.M., and shut altogether at 11 P.M., in London, but at 10 P.M. elsewhere. Christmas-day and Good Friday, but not public fast or thanksgiving days, are treated as Sundays. On week-days, such houses cannot be opened before 5 A.M., or after 12½ P.M., in London, and elsewhere before 6 A.M. and after 10 or 11 P.M. Travelers are expressly excepted from the above rule, and the decisions and statutes have settled the point that a traveler is a person who walks or drives three miles' distance, whether for pleasure or on business. As regards public-houses, constables have the power of entering them to keep order, and it is an offence in the publican to refuse them admission.—2. Beer-houses are subject to the same rules as ale-houses on Sundays. They also now require to have certificates or licenses from justices, and so do all wine-house keepers and grocers who sell beer, wine, spirits, sweets, and any intoxicating liquor. All houses licensed for the first time after 1872, for consumption on the premises, must be of higher values than formerly—namely, £12 to £50.

In 1872, many of the previous statutes were modified by the Intoxicating Liquor Licensing Act, 35 and 36 Vict. c. 94, and in 1874 by 37 and 38 Vict. c. 49. The chief new features were to define the opening and closing of the houses on Sundays and week-days, and to allow country justices to vary these hours a little. Though travelers are still entitled at all hours to enter inns, persons are subjected to penalties for falsely pretending that they are travelers, and also for being found within licensed premises without sufficient reasons, during the hours when such houses ought by law to be closed. Any constable may enter one of these houses for cause, and demand the name and address of persons found therein during prohibited hours, and it is an offence to give a false name and address. While the hours of opening and closing are now clearly defined, a power is given to the local justices or the metropolitan police commissioners to relax them for houses near any night-work or market. A power was also given to record convictions on the licenses, and after three convictions the keeper of the house was to forfeit his license and remain disqualified for five years, and even the premises themselves were to be disqualified from receiving a license for two years. The other chief feature was that justices were divided into two bodies for granting new licenses, one of them being a select committee to review the other, while there was no appeal allowed from the refusal to grant a license for a new inn. The justices thus had larger powers of refusal than before. The English Act of 1872 applied in most respects to Ireland; and many of its provisions were made applicable to Scotland by an Act passed in 1876.

In Scotland, the law affecting public-houses has been considerably altered of late years, and the governing statute is now 25 and 26 Vict., c. 35. Certificates for the sale of excisable liquors must be applied for to the justices of the peace, who meet for the purpose in April and October. The justices have a discretion in particular localities as to fixing the hours of closing within certain limits. Certificates to sell wines and spirits include power to sell beer and cider also; but they may be granted for the sale of wine, porter, ale, beer, cider, and perry only; or for beer, porter, ale, cider, and perry only; so that there are three kinds of certificates, corresponding to what exists in England. The justices' certificate also must be obtained for the spirit and wine license, before application for the excise license. The justices have power, in special circumstances, to regulate the hours of closing; but the general hours of closing in all cases are as follows: the houses shall not be open for sale or drinking before 8 A.M., nor after 11 P.M., with the exception of refreshment to travelers, or to persons lodging in the premises; and the house shall not be opened for the sale of any excisable liquors, or drinking thereof, on Sunday, except for the accommodation of lodgers and travelers. Though however, on Sundays, travelers and lodgers only are to be supplied with drink, this is only so in the case of inns and hotels; for with regard to public-houses proper, and spirit or beer-shops, these are not allowed to be open on Sundays even to travelers or lodgers. The certificate of justices is granted on the same conditions as to good order as in England. The owner of any property in the neighborhood may object to the granting or renewing of the certificate. Constables may enter at any time eating-houses, if they suspect excisable liquors are unlawfully sold there. The chief officer of police is to report to the procura-

tor-fiscal the places where intoxicated persons are seen frequently to issue. Persons keeping shebeens, or uncertificated places where spirits or excisable liquors are sold or drunk, are punished heavily, and also the persons found drunk there may be fined 10s.

The main difference between English and Scotch inns and public-houses is the shutting up these for the whole Sunday in Scotland. In both countries, travelers are excepted; and the same definition will and ought to be given to that word in both countries, and there is a penalty imposed in Scotland of £5 on any person who falsely represents himself to be a traveller, so as to procure entertainment and drink in an inn; as there now is also in England, where the burden of proof that the person served is a traveler is thrown on the publican; yet, if the latter take all precautions to ask and satisfy himself on the point, English statutes have now decided that he incurs no penalty. The policy of these restrictions on the opening of inns and public-houses on Sunday has been much discussed of late years.

PUBLIC PROSECUTOR. See **PROSECUTOR.**

PUBLIC SCHOOLS. See **SCHOOLS.**

PUCCINIA, a genus of fungi, of the division *Coniomyces*, all very small and parasitic, on the leaves or stems of plants within the tissue of which the mycelium creeps. One of the most common species, and the most important, is the **CORN MILDEW** (*P. graminis*), which is almost always present in corn-fields, and in some years is very injurious to wheat and other cereal crops. It is pithy brown or black, and grows in irregular lines, somewhat following the venation of the leaf, the lines sometimes confluent. The spores are supposed to find their way from the root upwards, with the juices of the plant on which they vegetate, but this has not yet been proved by observation.

PUD, or POOD, a Russian weight which contains 40 Russian pounds—almost equivalent to 36 English pounds avoirdupois.

PUDDING, although a word in such common use, and so generally understood, is very difficult to define, for there are few preparations of cookery so varied. It may be considered one of the national dishes of Great Britain; in no other country is it used so extensively by all classes of the people. The plum-pudding is the glory of an English table, and is regarded as an essential on all festive occasions. Puddings are either made of dough simply boiled in a cloth or basin, and with or without other materials; or they may be made of a batter of flour, or other farinaceous material, and water, and poured into the pudding-cloth and boiled; or into a dish and baked. It is common also to make fruit and meat puddings, by rolling out dough or paste into large flat sheets, and enclosing the fruit or meat entirely in them, and then tying them up in the pudding-cloth and boiling them. These are the general characters of this dish, but the recipes for varying the details are innumerable.

PUDDING-STONE, a rock composed of water-worn pebbles, cemented together by a firm paste. It is now more generally known as **Conglomerate** (q. v.).

PUDDLING, a process by which wells, ponds, canals, &c., are lined with clay or loam impervious to water. See **EMBANKMENT**.

PUEBLA, or **PUEBLA DE LOS ANGELES**, a city of Mexico, capital of a state of the same name, stands on a fruitful plain, 7381 feet above sea-level, and 76 miles east-south-east of the city of Mexico. In the vicinity are Orizaba, Popocatepetl, and other lofty mountains. It was founded in 1531, and is one of the most populous, as well as one of the most industrious cities in the empire. Its streets are regular, broad, and well paved. The houses, which are frequently three stories in height, are flat-roofed, covered with variously-colored tiles, and profusely ornamented, both inside and out, with fantastic paintings resembling frescoes. There are 44 fountains, and the water is supplied by means of an aqueduct. It contains 72 churches, 9 monasteries, 11 convents, and 23 theological colleges. On the great square stands the cathedral, an imposing building, the interior of which is decorated in the most sumptuous manner with ornaments of gold and silver, paintings, statues, &c. Among the numerous educational institutions, there are several of the highest class. There are also hospitals, the government and the bishop's palaces, charity schools, and other benevolent institutions. The more wealthy inhabitants are accomplished, refined, and benevolent; but the lower classes are esteemed the most demoralized in the empire. Glass, earthenware, soap, woollen fabrics, and sword-blades are manufactured. Pop. 70,000. After a siege of three months, P. surrendered temporarily to the French in May 1863. See **MEXICO**.

PUERPERAL FEVER, is the most fatal disease to which women in childbed are liable. It has been described under various other names than that which is now assigned to it—as *Childbed Fever*, *Peritoneal Fever*, &c. A careful investigation of the records of more than two centuries shows that the disease prevails

epidemically, and that it is more virulent in lying-in hospitals than in private practice. The essential nature of the disease is a subject that has led to the expression of many different opinions. The views that it is (1) *inflammation of the uterus*, (2) *inflammation of the omentum and intestines*, (3) *peritonitis, either alone or connected with erysipelas*, (4) *fever of a special nature*, (5) *disease of a putrid character*, or (6) *a disease of a complicated nature*, have all been advocated by physicians of high reputation; and Professor Scanzoni, one of the highest German authorities in the department of midwifery, maintains that the disease originates in an altered condition of the blood, and consists mainly in the presence of pus in that fluid. This variety of views is doubtless, in a great measure, due to the varied characteristics of different epidemics. When a disease is epidemic, it is always difficult to ascertain whether it is contagious; but in the case of puerperal fever, there is an overwhelming amount of evidence, not only that the virus can be carried by the practitioner from one parturient woman to another, but from various other morbid sources; the peculiar condition of childbirth, and possibly certain atmospheric conditions, rendering the mother peculiarly susceptible of such contagion. Numerous series of fatal cases have been traced back to the medical man or nurse having immediately before been in attendance on a case of erysipelas, of sloughing sores, of gangrene, or of typhus fever. It is the opinion of Rokitsansky and others that the morbid matter acquired by the dissection of subjects not dying from this disease, may excite the disease in a patient shortly afterwards delivered by the dissector; and there is no doubt that any one who assists at the *post-mortem* examination of a puerperal patient, becomes, as it were, a focus of intense contagion.

Considering the extreme severity and undoubted contagious nature of this disease, the practitioners and nurses who come in contact with it should bathe their persons, washing their hands either with a weak solution of chlorine in a solution of chloride of lime, or other disinfectant, as well as with soap and water; should use carbolic acid or salicylic acid gargles; and change the clothing. Moreover, persons much engaged in midwifery would do well not to take any part in *post-mortem* examinations, especially when the death resulted from this disease; and when of necessity they are present, they should wear a special dress for the occasion, and take every precaution to abluion.

Puerperal fever occurs in such varied forms that numerous divisions or species of it have been suggested. The late Dr. Gooch, one of the highest authorities on this subject, divided puerperal fever into (1) the *inflammatory* and (2) the *typhoid*; while Dr. Robert Lee and Dr. Ferguson (two of the chief authorities) make four divisions.

Inflammatory puerperal fever is most commonly due to peritonitis, but may depend upon inflammation of the uterus, the ovaries and uterine appendages, the uterine veins, &c. The ordinary symptoms, in the most common form (namely, when there is peritonitis), are rigors, followed by heat of skin, thirst, flushed face, quickened pulse, and hurried respiration. The abnormal heat of the skin soon subsides, and is followed by nausea, vomiting, pain in the region of the womb, commencing at one spot, and extending over the abdomen. This pain increases as the inflammation extends, till the patient presents the symptoms described in the article **PERITONITIS**. The pulse is uniformly high; the tongue coated; the urinary secretion diminished, and often passed with difficulty; while the intellectual faculties are rarely affected. Five or six days are the average duration of this disease, which may prove fatal on the first day, or may extend to ten or eleven days.

In some epidemics (as, for example, in Paris, in 1746; in Edinburgh, in 1773; and in Vienna, in 1795), none recovered. Dr. Ferguson states, that 'to save two out of three may be termed good practice in an epidemic season.' The treatment so closely resembles that which is required in ordinary acute Peritonitis (q. v.), that it is unnecessary to enter into any details regarding it.

Typhoid or malignant puerperal fever may commence in various ways, but is always accompanied with fever of a low typhoid character, and with the symptoms which usually are associated with such fever. Treatment is of little or no avail, and the patient usually sinks at the end of a few days, or even hours.

PUERPERAL MANIA comprehends many forms and degrees of mental derangement. In the experience of Esquirol, these forms presented the following proportions: of 92 cases, 49 exhibited symptoms of mania; 35, those of monomania; and 8, those of dementia. The points of agreement between these widely-differing moral phenomena are, that they occur during some stage of child-bearing, and that they can be traced to physical, but not necessarily common physical causes. Insanity is developed either during pregnancy, shortly after parturition, or during nursing. Under whatever circumstances the malady may arise, it is one of exhaustion, debility, and prostration; and this is nearly equally true, whether it be characterized by depression, languor,

and passiveness, or by extreme excitement and violence. The latter are the features by which it is generally recognized, and which have justified the name by which it is generally known. The similarity to ordinary frenzy is great: there is the same watchfulness, fury, incoherence, the same vitiation of the secretions, and emaciation; and the chief differences between these affections consist in puerperal insanity being invariably traceable to disturbance of the circulation, or to animal poisoning, and in the short duration of the great majority of cases.

The prognosis is, in fact, so favorable, recourse to seclusion in an asylum so painful, that it has been proposed to treat all such cases at home, or that a distinct hospital or sanatorium should be established exclusively for them. When it is stated that a physical cause may be detected in the puerperal condition, this must not be construed as excluding the psychological elements which enter into the production of all such affections. Thus, it was found by Macdonald, that of 66 cases, only 6 could be attributed to a purely physical origin; and that in the majority, fright, or anxiety, or anger had formed the last or principal of that series of conditions which culminated in alienation. It not merely affects feeble and hysterical females more than others, but in a marked manner those belonging to tainted families. Of 66 patients in the Bloomington Asylum, 17 labored under a hereditary tendency to mental disease. As connected with this point, it may be mentioned that unmarried are more liable to the disease than married women, in the proportion of 11 to 2. This great disparity may partly be explained by the fact, that the fallen and unfortunate are, more than any other class of females, compelled to seek shelter in those institutions from which such statistics are obtained.—Reed on *Treatment of Puerperal Insanity*; Marcé, *Folie des Femmes Enceintes*; Simpson, *The Diseases of Women*; Barker, *The Puerperal Diseases*.

PUERTO BELLO, a small decayed seaport town of the United States of Colombia, on the northern shore of the Isthmus of Panama, and 40 miles north of the town of that name. It is surrounded by mountains, has an excellent harbor, is very unhealthy, and has fallen into decay since 1789, when it was stormed by Admiral Vernon, during the war between England and Spain. Pop. 3500.

PUERTO-CABELLO, or **PORTO-CABELLO**, a town of Venezuela, in the province of Caracas, 78 miles west from Caracas. It stands on an island in the Golfo Triste, separated from the mainland by a channel so narrow as to be crossed by a bridge. The situation is very unhealthy, but the harbor is safe and commodious; its imports in 1877 amounted to £1,171,522; exports, £1,535,747. P. is the port of Valencia, which is about 20 miles inland. Pop. (1881) 10,145.

PUERTO DE SA'NTA MARIA (usually called **EL PUERTO**, the Port), a seaport of Spain, in the modern province of Cadiz, stands at the mouth of the Guadalete, in a most fertile district, on the Bay of Cadiz, 6 miles north-east of the city of that name, and 9 miles by railway south-west of Xeres. Suspension-bridges cross the Guadalete and the Rio de S. Pedro. The mouth of the Guadalete forms the harbor; but the bar is dangerous and much neglected. P., a pleasant and well-built town, resembling Cadiz in its houses, and containing only one long and handsome street, while the others are narrow and ill paved, is the port for the shipment of Xeres wines. The wines are lodged in numerous *bodegas*, or wine-stores, lofty buildings built with thick walls and narrow windows, in order to secure an even temperature inside. This town vies with Cadiz and San Lucar as a wine exporting place; the principal exporting houses are English or French. The bull-fights which take place here in May are among the most famous in the country. Steamers ply frequently between this town and Cadiz, and P. supplies that city with drinking-water at a cost of several thousand pounds a year. Pop. 21,278.

PUERTO PRINCIPÉ, **SANTA MARIA DE**, an important inland town, in the east of the island of Cuba, about 325 miles east-south-east of Havana, and 45 miles south-west of its port, Las Nuevas, with which it is connected by railway. Pop. 30,000.

PUERTO RICO, an island in the West Indies, belonging to Spain, is one of the Greater Antilles, and lies east of Hayti or St. Domingo, lat. 17° 55'—18° 30' N., long. 65° 39'—67° 11' W. It is in size somewhat less than Jamaica, being fully 100 miles from east to west, 40 miles from north to south, and closely resembling a rectangle in shape. The island is traversed from east to west by a range of mountains, 1500 feet in average height, though rising in one peak to 3678 feet above the sea. From the base of the mountains, rich alluvial tracts extend to the sea, and there are numerous well-wooded and abundantly watered valleys. The soil is remarkably fertile. The principal crops are sugar, coffee, and tobacco of the finest quality, and cotton remarkable for its length of fibre, tenacity, and whiteness. Cattle and sheep are extensively reared, of a quality superior to any others in the West Indies. The imports consist of cotton, woollen, linen, silk,

and embroidered goods, metals, hardware, and provisions, as ale, porter, fruits, wines, &c. The exports are sugar, tobacco, coffee, cotton, molasses, rum, hides, and cattle. The chief ports are San Juan, commonly called Puerto Rico, in the north-east, Ponce in the south-west, and Mayaguez in the west. P. R. is one of the coolest and healthiest places in the West Indies. Area, 3600 sq. m.; pop. (1880) 754,300, of whom about 350,000 are whites. Of the colored race, 20,000 were still slaves in 1871. The value of the annual exports is over £2,000,000; of the imports, £2,500,000. In 1878, 1,500,000 cwt. of sugar and 150,000 cwt. of coffee were exported. The trade is mainly with Britain, but owing to duties and port charges, it is carried on in Spanish bottoms.

The frequent changes in the executive government of P. R. do not appear to affect its commercial stability. The commerce of the island is almost wholly in the hands of foreigners and Spaniards from the Peninsula. The Preliminary Act of Emancipation, which came into operation at the beginning of 1871, decreased the number of slaves by 100,000. The slave-trade was already extinct; and in 1873 slavery was entirely swept away. There is a unanimous feeling against any immigration of laborers, whether Chinese, coolies, or others. A deep-sea cable now unites P. R. with Europe, America, and the other Antilles; railways, irrigation, drainage, &c., are still things in embryo. It is remarkable that, notwithstanding the fertility and healthiness of P. R., the poverty of the island flora and fauna is very great; there are hardly any flowers, birds, or wild animals.

PUFF-ADDER (*Olotho arietans*), a serpent of the family *Viperidae*, having a short and broad flat head, with scales so sharply keeled as to end in a kind of spine. It is one of the most venomous and dangerous serpents of South Africa. It attains a length of four or almost five feet, and is thick in proportion to its length, often as thick as a man's arm. Its head is very broad; its tail suddenly tapered; its color brown, chequered with dark brown and white; a reddish band between the eyes; the under parts paler than the upper. Its movements are generally slow, but it turns very quickly if approached from behind. It usually creeps partially immersed in the sand of the South African deserts, its head alone being completely raised above ground. When irritated, it puffs out the upper part of its body, whence its name. The P. is easily killed by the oil, or even by the juice of tobacco. Its poison is used by the Bosjesmans for their arrows.—South Africa produces several other species of *Olotho*, similar in their habits to the P., and almost equally dangerous.

PUFFBALL (*Lycoperdon*), a Linnæan genus of *Fungi*, now divided into many genera, belonging to the section *Gasteromycetes*, and to the tribe *Trichospermæ*. They mostly grow on the ground, and are roundish, generally without a stem, at first firm and fleshy, but afterwards powdery within; the powder consisting of the spores, among which are many fine filaments, loosely filling the interior of the *peridium*, or external membrane. The *peridium* finally bursts at the top, to allow the escape of the spores, which issue from it as very fine dust. Some of the species are common everywhere. Most of them affect rather dry soils, and some are found only in heaths and sandy soils. The most common British species is *L. gemmatum*, generally from one to two and a half inches in diameter, with a warty and mealy surface. The largest British species, the **GIANT P.** (*L. giganteum*), is often many feet in circumference, and filled with a loathsome pulpy mass, when young; but in its mature state, its contents are so dry and spongy that they have often been used for stanching wounds. Their fumes, when burned, have not only the power of stupefying bees, for which they are sometimes used, in order to the removal of the honey, but have been used as an anæsthetic instead of chloroform. The same properties belong also to other species. Some of them, in a young state, are used in some countries as food, and none of them is known to be poisonous.

PUFF-BIRD. See **BARBET**.

PUFFENDORF, **SAMUEL**, son of a Lutheran clergyman, was born in 1682 at Chemnitz, in Saxony. He received the early part of his education at Grimma; whence he removed to the university of Leipzig. There he studied theology for several years. In 1666 he went to the university of Jena, where he seems to have devoted himself at first chiefly to mathematics, and subsequently to the study of the *Law of Nature*, as he, and others who have treated on the same subject, have termed the law which regulates the duties of men to one another, independent of the mutual obligation which is enforced by political government, or by revelation of divine will. After quitting Jena, he was appointed tutor to the son of the Swedish ambassador at Copenhagen. Soon after he had received this appointment, a rupture having taken place between Denmark and Sweden, P. was detained as a prisoner in the Danish capital. The power of his mind here showed itself in a remarkable manner. Deprived of books and of society, he threw himself vigorously into meditating on what he had formerly read in the treatise of Grotius, *De Jure Belli et Pacis*, and in the writings of Hobbes on the principles of general law. The result

was the production of the *Elementa Jurisprudentiæ Universalis*—a work which was the foundation of its author's fortune. It was dedicated to the Elector Palatine; and by this prince, P. was appointed to the professorship of the Law of Nature and Nations at the university of Heidelberg. He now gave his attention to the tissue of absurdities which existed in the constitution of the Germanic Empire. As was to have been expected, the work (*De Statu Reipublicæ Germanicæ*, 1667), in which he exposed the defects of the system, raised a storm of controversy.

Austria was especially furious. P. had taken care to publish it under a pseudonym—that of Severinus a Mozambano, but still to avoid the possible consequences, he accepted an invitation from Charles XI. of Sweden, in 1670, to become professor of the Law of Nations at Lund. During his residence there, he published the work on which his fame now principally rests, *De Jure Naturæ et Gentium*. He then removed to Stockholm, where the king of Sweden made him his historiographer, with the dignity of a counsellor of state. In his official character, he published a very uninteresting history of Sweden, from the expedition of Gustavus Adolphus into Germany to the death of Queen Christine. In 1688, the Elector of Brandenburg invited him to Berlin to write the history of his life and reign. P. accepted the invitation, and executed the required work in 19 dreary volumes. His intention was to have returned to Stockholm, but death overtook him at Berlin in 1694. P. lacked the genius to render the subjects on which he wrote generally interesting, but his intellectual power was nevertheless very considerable, and it appears to have throughout been honestly exercised and with unflinching industry.—See Jenisch's *Vita Pufendorfi* in the *Memoirs of the Academy of Stockholm*, 1802.

PU'FFIN (*Fratercula*), a genus of birds of the Auk (q. v.) family, *Alceda*, having the bill shorter than the head, very much compressed, its height at the base equal to its length, the ridge of the upper mandible as high as the top of the head, both mandibles arched, and transversely grooved. The bill gives to the birds of this genus a very extraordinary appearance. They have short legs, very short tail, and short wings; their legs are placed far back, and they sit very erect, like auks and penguins, resting not merely on the foot, but on the tarsus. Notwithstanding their shortness of wing, they fly rapidly, although they seem incapable of long-sustained flights. They swim and dive admirably. The best known and most widely distributed species is the COMMON P. (*P. arctica*), a native of the arctic and northern temperate regions, breeding not only in high northern latitudes, but as far south as the coasts of England, and migrating from the colder regions in winter, when it is to be found even on the coasts of Spain and of Georgia. The P. is a little larger than a pigeon; the forehead crown, back of the head, a collar round the neck, the back, wings, and tail are black, the other parts of the plumage white. The P. lays only a single egg, sometimes in a rabbit burrow, but more frequently in a burrow of its own, which often extends three feet, and is not unfrequently curved; sometimes in deep fissures or crevices of cliffs. Great numbers congregate together, and their chosen breeding-places are crowded with them. These are mostly on unfrequented islands and headlands, where there is some depth of soil. In some of them, the ground is covered by puffins, old and young, in thousands. The eggs are sought after by fowlers, and also the young birds, the flesh of which is used for food. The Scilly Isles were held in the 14th c., under the king as Earl of Cornwall, by Ranulph de Blacminster, for an annual payment of 6s. 8d., or 300 puffins at Michaelmas. The P. is also known by the name *Coulterneb*, and on the east coast of Scotland it is familiarly called *Tammienorie*. Their food consists of small crustaceans and fishes.—Other species are found in different parts of the world; one in Kamchatka, the Kurile Islands, &c., with two silky tufts of long feathers on its head.—The name P. is given in France to the *Shearwaters* (q. v.), or *Puffin Petrels*, the genus *Puffinus* of some ornithologists.

PUG, or **PUG-DOG**, a kind of dog much like the bull-dog in form, and in particular, in its much abbreviated muzzle. The nose is often a little turned up. The disposition is, however, extremely unlike that of the bull-dog, being characterized by great timidity and gentleness. Pug-dogs are only kept as pets. They are often very affectionate and good-natured, bearing without resentment the roughest handling to which children can subject them. They are all of small size. The common English Pug is usually yellowish with a black snout, the tail firmly curled over the back. New breeds have of late been introduced from China and Japan, interesting from their peculiar appearance, gentleness, and docility, with extremely short *puggish* muzzle; the Chinese breed very small, with smooth hair; the Japanese rather larger, with an exuberance of long soft hair and a very bushy tail.

PU'GET SOUND, the southern continuation of the Admiralty Inlet, in the N.W. of Washington Territory, U.S. In a wide sense, P. S. includes the Admiralty Inlet, and thus would comprise the whole body of water to the south-east of Vancouver Island, connecting with the Pacific by Fuca Strait, and is a land-

locked sea 125 miles long, by from 5 to 25 miles broad. Even in this sense P. S. is all navigable; and the smaller inlets especially afford safe, deep, and spacious harborage. The coast-line of P. S., in the stricter sense, is 280 miles; in the wider sense, 806, Admiralty Inlet extends from the strait of Fuca, about 70 miles; the sound itself extends S.E. from the 'Narrows,' and has numerous islands and inlets. The shores are fertile and richly timbered. The sound has received a new importance from the completion in 1883 of the Northern Pacific Railway, which has a main terminus at Tacoma, a rapidly-increasing place on P. S., and an extension to Seattle, on the east shore of the sound. Other towns on the sound are Olympia, capital of the territory; Stellacoom; and Port Townsend. The difficult navigation of the lower Columbia River causes much of the traffic of its basin to be sent to Tacoma to be shipped; Tacoma has accordingly a great and increasing grain trade, and around the shores of the sound there is an enormous timber trade. The forest mainly consists of redwood, the timber of the *Sequoia sempervirens*. The wood is light and close grained, but not very strong; splits very easily; is eminently durable, and is well suited both for building purposes and for cabinet work. The only other species of the sequoia genus is the *S. gigantea*, the so-called Wellingtonia (q. v.). Coal is found near Seattle, and exported.

PU'GILISM, or **BOXING**, is the art of defending one's self or attacking others with the weapons which nature has bestowed—fists and arms. The origin of boxing is likely as old as man himself. Pollux, the twin-brother of Castor in the heathen mythology, was reckoned the first who obtained distinction by the use of his fists. The ancients increased the power of their fists by the addition of the Cestus (q. v.). With the ancients pugilism was considered an essential part in the education of youth, and formed part of the course of training practised in their gymnasia; it was valued as a means of strengthening the body and banishing fear; but it was practised in public rather with a view to the exhibition of the power of endurance than for mere skilful self-defence. The earliest account we have of systematic British boxing is in 1740, when public exhibitions of professors of the art attracted general attention. Up to this period, the science of self-defence had made but little progress, and strength and endurance constituted the only recommendations of the practitioners at Smithfield, Moorfield, and Southwark fair, which had long had booths and rings for the display of boxing. Broughton, who occupied the position of 'champion of England,' built a theater in Hanway Street, Oxford Street, in 1740, for the display of boxing; advertisements were issued announcing a succession of battles between first-rate pugilists who never quitted the stage till one or other was defeated, the reward of each man being dependent upon, and proportioned to, the receipts. Broughton was for 18 years champion of England, and with him commences the first scientific era of pugilism. He propounded some rules for the regulation of the ring, and these remained in authority till 1888, when they were materially altered. Rule 1 is, That a square of a yard be chalked in the middle of a stage, and that in every fresh set-to after a fall, the seconds are to bring their men to the side of the square, and to place them opposite each other, and until this is done, it is not lawful for one to strike the other. Rule 2, That if either of the combatants is unable to be brought up to the square within 30 seconds after a fall and the close of a round, he shall be deemed a beaten man. No man is permitted to hit his adversary when he is down, or to seize him by the breeches, or below the waist, and a man on his knees is to be reckoned down.

These rules laid the foundation of fair play, and robbed boxing of half its horrors. To Broughton also is due the introduction of gloves for 'sparring-matches,' where lessons could be taken without injury. The greatest professor of the art was Jackson, who was champion in 1795. He was not only the most scientific boxer of his day, but he gave his art such a prestige and popularity that half the men of rank and fashion of the period were proud to call themselves his pupils. He opened rooms for the practice of boxing in Bond Street, and for years these were crowded by men of note. His 'principles of pugilism' were, that contempt of danger and confidence in one's self were the first and best qualities of a pugilist; that in hitting, you must judge well your distances, for a blow delivered at all out of range, was like a spent shot, and valueless; that men should fight with their legs, using all possible agility, as well as with their hands; and that all stiffness of style and position was wrong. Jackson is still regarded as the best theorist on the 'noble art,' and since his time, it has received no essential improvement. Shaw, the Life Guardsman, who immortalized himself at Waterloo, was a pupil of his, and the prowess which he so brilliantly displayed on that occasion, was owing as much to his scientific training as to his great strength. At this period, pugilism was actively supported by many persons of high rank—the Dukes of York and Clarence, the Earls of Albemarle, Sefton, &c., Lords Byron, Craven, Pomfret. In 1814, when the allied sovereigns were in England, among other entertainments,

a 'sparring' display was provided under Jackson's management; and the distinguished foreigners expressed the great gratification they had experienced from the exhibition of so much science and fine physical development. Besides Jackson, Belcher, Gulley, and Cribb were noted champions at this period. George IV. was a staunch patron of boxing in his youth, and although he discontinued by his presence to give countenance to the sport, frequent indications were observable of his desire for its promotion. At the time of the coronation, when the popular feelings were much enlisted on behalf of Queen Caroline, who was excluded from the throne, a body of pugilists were employed to preserve order; and so well did these men perform their duties, that the king presented each man with a gold medal, to commemorate the event, and to show his satisfaction. This period may be termed the 'palmy days of the ring'; and from various causes, its decline has since then been uninterrupted.

Among other causes, several cases occurred of prize-fighters who were tempted to lose fights on which large sums had been staked, and to deceive their most influential backers. The most distinguished patrons of the ring gradually seceded; the 'Pugilistic Club,' which had been established in 1814, and which included all the aristocratic patrons of the ring, was broken up. The magistracy of the country set their faces against the lawless assemblies of 'roughs' and pickpockets who latterly formed the greater part of the spectators at prize-fights. The electric telegraph, and the establishment of an efficient rural police, have given the finishing touches to an already-expiring profession. Matches can now only be got up by stealth, and the place of meeting is kept a profound secret to the last moment, for fear of interruption. A few years ago, however, the international combat between Tom Sayers the Englishman, and John Heenan the American, revived for a moment public interest in the art; but apart from exceptional matches, the popular feeling is that prize-fighting should not be countenanced, and we may look for its gradual extinction. The art of boxing, as an active and healthy exercise, is likely to be maintained; and the display of science between two accomplished boxers is very interesting, while it is deprived of all the horrors of the prize-ring; the rapidity of the blows, the facility with which they are mostly guarded or avoided by moving the head and arms; the trial of skill and maneuver to gain a trifling advantage in position, all give a wonderful interest to the spectator, who can watch the perfection of the art devoid of the brutalities of the ring. The pugilists of the present day are mostly publicans; their friends and the patrons of the 'fancy' meet at their houses for convivial evenings, sparring-matches, rattling, and the like. It has constantly been urged in defence of pugilism, that were it abolished, the use of the knife would increase, and Englishmen would lose their present manly system of self-defence. This may be true, if the use of the fist in self-defence depended on the mercenary exhibition of pugilistic encounters, which, however, is mere assumption.—On this subject, see *Pistiane* (office of *Bell's Life*, 1868); *Pugilistica*, by H. D. Miles (1880).

PULCI, LUIGI, an Italian Poet of distinguished family, was born at Florence, 8d December 1431, and devoted his life to study and to literary composition. He was one of the most intimate friends of Lorenzo de' Medici and of Poliziano, from the latter of whom he derived no little assistance in the composition of his poem *Il Morgante Maggiore* (Morgante the Giant). This celebrated work, a burlesque epic (in 28 cantos), of which Roland is the hero, is a vivacious parody of the romances of Carolingian chivalry, which had become (as P. thought) undeservingly popular in Italy. His mocking imagination took a pleasure in turning into ridicule the combats with giants, the feats of magicians, and all the incredible adventures that form the materia basis of the medieval epic; and he manages to do it with a wonderfully pleasant and original naïveté. But although the poem is essentially heroic-comic, it occasionally contains passages of the finest pathos, in which P. fortunately seems to forget his design of travestying the inventions of the *trouvères*, and comes out undisguisedly as a real poet. Moreover, in the midst of the most extravagant buffooneries, we come upon the truest and most natural pictures of manners—the vanity and inconstancy of women, the avarice and ambition of men. P. died in 1487. The *Morgante Maggiore* is one of the most valuable sources for acquiring a knowledge of the early Tuscan dialect, the niceties and idioms of which have been employed by P. with great skill. The first edition appeared at Florence in 1488, and has since been frequently reprinted. Other works of P. are a series of sonnets (often grossly indecent), *La Beca du Dicomano* (a parody of a pastoral poem by Lorenzo de' Medici); *Confessione a la San Vergine*, a novel, and some letters.—**BERNARDO PULCI**, elder brother of Luigi, wrote an elegy on the death of Simonetta, mistress of Julian de' Medici; and a poem on the passion of Christ and also executed the first translation of the *Elogues* of Virgil.—**LUCA PULCI**, another brother, achieved some literary reputation too by his *Giostra di Lorenzo de' Medici*, a poem in honor of the

success won by Lorenzo in a tournament; *Il Ciriffo Calvaneo*, a metrical romance of Chivalry; *Driadeo d'Ancore*, a pastoral poem; and *Epistole Eroide*.

PUL'LEX. See **FLEA**.

PULICAT, **PALIKAT**, or **PALVELAKA'TU**, a town of British India, in the presidency of Madras, and district of Chingleput, 20 miles north from Madras. It stands on an island in a large inlet of the sea or salt-water lake called the Lake of Pulicat. The lake is about 37 miles in length from north to south, and 11 miles in breadth at the widest. It contains a number of islands. The communication between the lake and the sea is by very narrow openings. The lake is much used as affording facilities of traffic by boats between Madras and more northern places. P. was occupied by the Dutch in 1609, and became afterwards the capital of their settlements on the Coromandel coast, but fell into the hands of the British in 1795.

PULKO'VA, a village of Russia, in the government of St. Petersburg, about 9 miles south of the capital, contains a population of 600. It stands on a ridge called Pulkova Hills, which command a splendid view of St. Petersburg, and is noted for its magnificent observatory, built by the Czar Nicholas, and placed under the direction of Friedrich Struve. Struve's son succeeded to the charge in 1864. In 1882, a remarkable telescope, said to be the largest in the world, was erected here.

PULLEY, one of the Mechanical Powers (q. v.), consists of a wheel, with a groove cut all round its circumference, and movable on an axis; the wheel, which is commonly called a *sheave*, is often placed inside a hollow oblong mass of wood called a *block*, and to the sides of this block the extremities of the sheave's axle are fixed for support; the cord which passes over the circumference of the sheave is called the *tackle*. Pulleys may be used either singly or in combination; in the former case they are either *fixed* or *movable*. The *fixed pulley* (fig. 1) gives no mechanical advantage; it merely changes the direction in which a force would naturally be applied to one more convenient—thus, W can be raised without lifting it directly by merely pulling P down. The *single movable pulley*, with parallel cords, gives a mechanical advantage = 2 (fig. 2), for a little consideration will show that is

Fig. 1.

Fig. 2.

the weight W, is supported by two strings, the strain on each string is $\frac{1}{2}W$, and the strain on the one being supported by the hook A, the power, P, requires merely to support the strain on the other string, which passes round C. The fixed pulley, C, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel, there is a diminution of mechanical advantage—i. e., P must be more than half of W to produce an exact counterpoise; if the angle made by the strings is 120° , P must be equal to W; and if the angle be greater than this, there is a mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system, one end of each cord is fastened to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight, W, is fastened), and is fastened to the block of the next pulley, with the exception of the last cord, which passes round a fixed pulley above, and is attached to the counterpoise P.

The tension of a string being the same in all parts, the tension of every part of the string marked (1) in fig. 3 is that which is produced by the weight of P, consequently, as the last movable pulley is supported on both sides by a string having a tension P, the tension applied in its support is 2P. The tension of the string marked (2) is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shown that the force applied by the strings marked (4) in support of the last pulley (which is attached to W), is 8P. Hence, we see, that according to this arrangement, 1 lb. can support 4 lbs., if two movable pulleys are used; 8 lbs., if there are 3 movable pulleys; 16 lbs., if there are 4 movable pulleys; and if there are n movable pulleys, 1 lb. can support 2^n lbs. It must be noticed, however, that in practice, the weight of the cords, and of the pulleys, and

the friction of the cord on the pulleys, must be allowed for; and the fact, that in this system all of these resist the action of the power P , and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much more convenient in practice, and is modified according to the purpose for which it is to be used; two prevalent forms are given in figs. 4 and 5. In this system, one string passes round all the pulleys, and as the tension in every part of it is that produced by the

Fig. 3.

Fig. 4.

Fig. 5.

weight of P , the whole force applied to elevate the lower block with its attached weight, W , is the weight P multiplied by the number of strings attached to the lower block; in fig. 4, $W = 4P$, and in fig. 5, $W = 6P$, the pulleys in the upper block being only of use in changing the direction of the pulling force. This system is the one in common use in architecture, in dock-yards, and on board ship, and various modifications of it—such as White's pulley, Smeaton's pulley, &c., have been introduced; but the simpler forms shown above have been found to answer best.—The third system (fig. 6) is merely the first system inverted, and it is a little more powerful, besides having the weight of the pulleys to support the power, instead of acting in opposition to it, as in the former case.

By this time, it will have been evident to the reader that the mechanical advantage is not produced by the pulleys, but by the strings, and that the pulleys are merely useful in keeping the strings in a certain position, changing with as little friction as possible the direction of the pull, and affording a convenient means of attaching the weight. Theoretically, the larger the number of movable pulleys in one combination, the greater is the mechanical advantage afforded; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys.

PULMONATA, an order of gastropodous molluscs, having, for the purpose of respiration, a vascular air-sac or lung, which opens by a hole under the margin of the mantle, capable of being contracted or dilated at pleasure. Some are terrestrial, some aquatic. Slugs and snails are familiar examples of the former; water-snails, or pond-snails (*Limnaea*, *Planorbis*, &c.), of the latter. Most of the P . are protected by a shell; in some, as slugs, the shell is internal and rudimentary.

PULNEY or **PALNAI HILLS**, a range of Southern India, linking the southern extremities of the Eastern and Western Ghauts. The average height of this range is about 7500 feet above the level of the sea. It possesses peculiar advantages for the establishment of a sanitarium. The climate is one of the most equable anywhere to be found, the variation of the thermometer during twelve months in a closed room without a fire being observed to be no greater than between 55° and 62° . At present, there are only a few European residences built on these hills.

PULO-PENANG. See **PRINCE OF WALES ISLAND**.

PULP, a term employed to describe those very soft and succulent parts of plants, almost exclusively of fruits, which consist of cellular tissue with much juice. The pulp of a fruit is sometimes found in one part of it, sometimes in another; thus, in the peach, plum, and other drupes, it is the *mesocarp*; in the grape and gooseberry, it is developed from the placentas, and the seeds are embedded in it.

PULPIT (*Lat. pulpitum*), an elevated tribune or desk, from which sermons, lectures, and other solemn religious addresses are delivered. In great churches, the pulpit is commonly placed

against the wall, or in juxtaposition with a pillar or buttress. Originally it would appear to have been used chiefly for the singing, chanting, or recitation which form part of the public service, and was a kind of stage sufficiently large to accommodate two or even more chanters. For the convenience of the hearers, this stage began to be used by the bishop, priest, or deacon, for the delivery of the homily; and thus by degrees a tribune expressly suited to the latter use alone came to be introduced. In some of the older churches, the *ambo* or *pulpitum* is still used for the chanting of the Gospel and Epistles. In Catholic churches, the pulpit is generally distinguished by some religious emblems, especially by the crucifix; and the pulpits of the Low Countries and of Germany are often masterpieces of wood-carving, the preaching-place in some of them forming a part of a great artistic group, as of the Conversion of St. Paul, the Vocation of Peter and Andrew, the temptation of Adam and Eve, and other similar subjects. The pulpit (in Arabic, *mimber*) forms one of the scanty appliances of Mohammedan worship.

PULQUE, a favorite beverage of the Mexicans and of the inhabitants of Central America, and some parts of South America; made from the juice of different species of *Agave* (q. v.), which is collected by cutting out the flowering-stem from the midst of the leaves in the beginning of its growth, and scooping a hole for the juice. From this cavity, large quantities of juice are removed daily for months. The juice is an agreeable drink when fresh, but is more generally used after fermentation, when it has a very pleasant taste, but a putrid smell, disgusting to those unaccustomed to it. Pulque is retailed in Mexico in open sheds called *Pulquerias*, which also serve for dancing-rooms. When mixed with water and sugar, and allowed to ferment for a few hours, it forms a beverage called *Tepache*. A kind of spirit is also prepared from it.

PULSE (*Lat. puls*), a name for the edible seeds of leguminous plants, as *corn* is the name for the edible seeds of grasses. Peas and beans are the most common and important of all kinds of pulse; next to them may be ranked kidney-beans, lentils, chick-peas, pigeon-peas, &c. *Legumine* (q. v.), a very nitrogenous principle, abounds in all kinds of pulse. Legumine forms a thick coagulum with salts of lime, wherefore all kinds of pulse remain hard if boiled in spring-water containing lime. The best kinds of pulse are very nutritious, but not easy of digestion, and very apt to produce flatulence.

PULSE (*Lat. pulsus*, a pushing or beating). The phenomenon known as the arterial pulse or arterial pulsation is due to the distention of the arteries consequent upon the intermittent injection of blood into their trunks, and the subsequent contraction which results from the elasticity of their walls. It is perceptible to the touch in all excepting very minute arteries, and in exposed positions, is visible to the eye.

'This pulsation,' says Dr. Carpenter, 'involves an augmentation of the capacity of that portion of the artery in which it is observed; and it would seem to the touch as if this were chiefly effected by an increase of diameter. It seems fully proved, however, that the increased capacity is chiefly given by the elongation of the artery, which is lifted from its bed at each pulsation, and when previously straight, becomes curved; the impression made upon the finger by such displacement not being distinguishable from that which would result from the dilatation of the tube in diameter. A very obvious example of this upheaval is seen in the prominent temporal artery of an old person.'—*Principles of Human Physiology*, 4th ed., p. 492. The number of pulsations is usually counted at the radial artery at the wrist, the advantages of that position being that the artery is very superficial at that spot, and that it is easily compressed against the bone. In some cases, it is preferable to count the number of contractions of the heart itself.

The qualities which are chiefly attended to in the pulse are its frequency, its regularity, its fulness, its tension, and its force.

The frequency of the pulse varies greatly with the age. In the *fœtus in utero*, the pulsations vary from 140 to 150 in the minute; in the newly-born infant, from 130 to 140; in the 2d year, from 100 to 115; from the 7th to the 14th year, from 80 to 90; from the 14th to the 21st year, from 75 to 85; and from the 21st to the 60th year, 70 to 75. After this period, the pulse is generally supposed to fall in frequency, but the most opposite assertions have been made on this subject. There are many exceptions to the preceding statement; young persons being often met with having a pulse below 60, and cases not unfrequently occurring in which the pulse habitually reached 100, or did not exceed 40 in the minute, without apparent disease. The numbers which have been given are taken from an equal number of males and females, and the pulsations taken in the sitting position. The influence of sex is very considerable, especially in adult age, the pulse of the adult female exceeding in frequency that of the male of the same age by from 10 to 14 beats in the minute. The effect of muscular exertion in raising the pulse is well known; and it has been found

Fig. 6.

by Dr. Guy that posture materially influences the number of pulsations.

Thus, in healthy males of the mean age of 27 years, the average frequency of the pulse was, when standing, 81, when sitting, 71, and when lying, 66, per minute; while in healthy females of the same age the averages were—standing, 81; sitting, 84; and lying, 79. During sleep, the pulse is usually considerably slower than in the waking state. In disease (acute hydrocephalus, for example), the pulse may reach 150 or even 200 beats; or, on the other hand (as in apoplexy and in certain organic affections of the heart), it may be as slow as between 30 and 20.

Irregularity of the pulse is another condition requiring notice. There are two varieties of irregular pulse: in one, the motions of the artery are unequal in number and force, a few beats being from time to time more rapid and feeble than the rest; in the other variety, a pulsation is from time to time entirely left out, constituting intermission of the pulse. These varieties often concur in the same person, but they may exist independently of each other. Irregularity of the pulse is natural to some persons; in others, it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or by organic disease of the heart; and hence the practical importance of ascertaining the various meanings of this symptom.

The pulse is said to be *full* when the volume of the pulsation is greater than usual, and it is called *small* or *contracted* under the opposite condition. A full pulse may depend upon general plethora, on a prolonged and forcible contraction of the left ventricle of the heart, and possibly, to a certain extent, on relaxation of the arterial coats; while a small pulse results from general deficiency of blood, from feeble action of the heart, from congestion of the venous system, or from exposure to the action of cold. When very small, it is termed *thread-like*.

The *tension* of the pulse is the property by which it resists compression, and may be regarded as synonymous with *hardness*. A hard pulse can scarcely be stopped by any degree of pressure of the finger. It occurs in many forms of inflammation, and its presence is commonly regarded as one of the best indications of the necessity of venesection. A *soft* or compressible pulse is indicative of general weakness.

The *strength* of the pulse depends chiefly on the force with which the blood is driven from the heart, but partly also upon the tonicity of the artery itself and the volume of the blood. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hypertrophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigor, so *weakness* of the pulse indicates debility. There may, however, be cases in which weakness of the pulse may occur in association with undiminished energy of the system at large. For example, active congestion of the lungs may so far impede the passage of the blood through these organs that it cannot reach the heart in due quantity; the necessary result is a weak and feeble pulse, which will rapidly increase in strength if the congestion is relieved by free blood-lettings. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. Thus, we read of the jerking pulse, the hobbling pulse, the corded pulse, the wiry pulse, the thrilling pulse, the rebounding pulse, &c.

PULTOWA. See POITAVA.

PUL'TUSK, a town of Poland, in the government of Lomza, is situated in a thickly-wooded district on the Narew, 35 miles north-north-east of Warsaw. It contains numerous churches and a very large bishop's palace. Pop. (1880) 7689. Here, on December 26, 1806, was fought one of the battles of the campaign of Eylau, between the Russians and the French. The field was most obstinately contested, but the victory, which, however, was claimed by both armies, inclined in favor of the French.

PUL'LU, a beautiful substance, resembling fine silk of a rich brown color and satin lustre, used largely as a styptic by the medical practitioners of Holland, and introduced into this country for the same purpose. It consists of the fine hairs from the atipes of one or more species of tree-fern, referrible, without doubt, to the genus *Cibotium*. It was first imported into this country in 1844 from Owhyhee under the name of Pulu, or vegetable silk, and was proposed as a substitute for silk in the manufacture of hats, but could not be applied. In 1856, it was again imported from Singapore under the Malay names of Penghawar Djambi and Pakoe Kidang, and was said to have been used in Dutch pharmacy for a long period as a styptic. Several importations have since taken place, and it has been successfully used. It acts mechanically by its great absorbent powers.

PULWUL, a town of British India, in the district of Gurgaon, in the Punjab, 36 miles south-by-east from Delhi, on the route to Muttra. Pop. (1868) 12,629.

PU'MA, or COUGAR (*Felis concolor*, *Leopardus concolor*, or *Puma concolor*), one of the largest of the American *Felidae*, rivalled only by the jaguar. It is sometimes called the American Lion, although it is more allied to the leopard, notwithstanding its wants of spots and stripes. It is from 4 to 4½ feet in length from the nose to the root of the tail, and the tail about 2 feet or 2½. The fur is thick and close, reddish-brown above, lighter on the sides, and reddish-white on the belly; the muzzle, chin, throat, and insides of the legs grayish-white, the breast almost pure white. Young pumas have dark-brown spots in three rows on the back, and scattered markings elsewhere, exhibiting the relation to the leopards. The long tail of the P. is covered with thick fur, and is generally coiled up, as if it were prehensile, which it does not seem to be, although the P. climbs trees very well, and often descends on its prey from among their branches. The P. was formerly found in all except the coldest parts of America, but is now rare in most parts of North America, having been expelled by man. It rarely attacks man, but is very ready to prey on domestic animals, and seems to have a thirst for blood beyond that of other *Felidae*, one P. having been known to kill 50 sheep in a night, drinking a little of the blood of each; a very sufficient reason for the anxiety which all American farmers show for its destruction. Yet it is easily tamed, and when tamed, a very gentle creature, purring like a cat, and showing equal love of attentions. The geographical range of the P. extends far southwards in Patagonia, and northwards even to the state of New York, although it is now very rare in all long-settled parts of North America. It is the *Painter* (Panther) of North American farmers. It sometimes issues from the forests, and roams over prairies and pampas, and is not unfrequently caught by the lasso of South American hunters.—A BLACK P. (*Felis nigra* of some naturalists), a doubtful species, and probably only a variety of the common P., is found in some parts of South America.

PU'MICE, a mineral found in volcanic countries, generally with obsidian and porphyries. In chemical composition, it agrees with obsidian, of which it may be regarded as a peculiar form, rapidly cooled from a melted and boiling state. It is of a white or gray color, more rarely yellow, brown, or black; and so vesicular, that in mass, it is lighter than water, and swims in it. The vesicles, or cells, are often of a much elongated shape. P. often exhibits more or less of a filamentous structure; and it is said to be most filamentous when silica is most abundant in its composition. It is very hard and very brittle. It is much used for polishing wood, ivory, metals, glass, slates, marble, lithographic stones, &c., and in the preparation of vellum, parchment, and some kinds of leather. Among other purposes to which it is applied is the rubbing away of corns and callosities. Great quantities are exported from the Lipari Isles to Britain and all parts of Europe. The Lipari Isles are in great part composed of P., which there, as in some other places, occurs as a rock. P. is the chief product of some volcanic eruptions; but in some eruptions none is produced. It is found also in regions where there are now no active volcanoes, as at Andernach on the Rhine.

PU'MPKIN. See GOURD.

PUMPS are machines for raising water and other fluids to a higher level. They are divided into several classes according to their mode of action. Of these, as the most important, we shall describe in detail the following: 1. The Lift or Suction Pump; 2. The Lift and Force Pump; 3. The Chain-pump; 4. The Centrifugal Pump; 5. The Jet-pump.

1. *The Lift or Suction Pump*.—The diagrams figs. 1 and 2 represent the ordinary suction pump. A is a cylinder, which is called the barrel; with it is connected at the bottom a pipe, B, which communicates with the water to be raised; and at its top is another pipe, C, which receives the water raised. In the barrel are placed two valves, D and E. D is fixed in position at the bottom of the barrel; E is attached to, and forms part of the piston F, which moves up and down the barrel when motive-power is applied to the rod G. The piston, or bucket, consists of a cylindrical piece of wood or metal, which fits exactly the barrel in which it moves, so that no water or air can pass between its circumference and the sides of the cylinder. This tight fitting is attained in wooden pistons by surrounding them with a leather ring; and in those of metal, by hemp or other packing, which is wrapped round a groove made in their outer surface. The hollow interior of the piston is closed at the top by the valve E, which is a kind of door opening on a hinge, at one side of it, in an upward direction, on the application of pressure, and shutting on to its seat on the piston when the pressure is removed. When opened, water or air can pass through it to the upper side of the piston; but when shut, none can pass from one side of the piston to the other. The other valve, D, is similar to it in all respects, except that, as before stated, it is fixed in the bottom of the barrel; it also can only open upwards.

To describe the action of the pump, we shall suppose the piston to be at the bottom of the barrel, and the pump to contain nothing

but air. On moving the piston up the barrel—the valve in it being shut, and kept so by the atmospheric pressure above it—no air can pass from above it into the part of the barrel from which it is moving; the air contained in which becoming rarefied, by having to occupy a greater space, exerts less pressure on the valve D at

the power expended and the work produced, as measured by the water raised—we may remark, that the power is expended—1st, in raising the water through the required height; 2d, in overcoming the friction of the moving parts of the pump; 3d, in the friction and fluid resistance of the water in passing through the valves and pipes; 4th, in the losses arising from the want of proper proportion between the various parts of the pump. The losses arising from these last sources are very great, and vary so much according to the construction of each particular pump, that no useful estimate can be formed of this efficiency. We may say, however, that a pump of this description, to yield 50 per cent. of the applied power must be well proportioned and carefully constructed.

2. *The Lift and Force Pump.*—Figs. 3 and 4 represent two varieties of this pump. That shown in fig. 3 is very similar to the suction-pump before described, with the exception, that the valve E, instead of being fixed on the piston, is placed in the discharge-pipe, the piston itself being solid.

Fig. 1.

Fig. 2.

the bottom of the barrel than the air in suction-pipe B below it. This valve is thus opened, and the air from the suction pipe enters the barrel; so that when the piston has arrived at the top, a volume of air equal to the contents of the barrel has passed from the suction-pipe into the barrel. When the piston descends, it compresses the air in the barrel, which shuts the valve D; and when the density of the compressed air becomes greater than that of the atmosphere, the valve E in the piston is forced open, and the air in the barrel passes to the upper side of the piston. The next upward stroke of the piston again draws a like quantity of air from the suction-pipe into the barrel; and, as none of this air again enters the pipe, but is passed to the upper side of the piston by its downward stroke, the suction-pipe is by degrees emptied of the air it contained. During this process, however, motion has taken place in the water at the foot of the suction-pipe. The surface of the water at H is pressed upon by the weight of the atmosphere with a pressure of about 15 lbs. on every square inch; and by the laws of fluid-pressure, if an equal pressure is not exerted on the surface of the water in the suction-pipe, the water will rise in it, until the pressure on its surface, plus the weight of its fluid column, balances the pressure of the atmosphere on the surface H outside; so that, as the air in the suction pipe is rarefied, the water rises in it, until, when all the air is extracted from it, the water stands at the level of the valve D. By the next upward stroke of the piston, the barrel being emptied of air, the water follows the piston, and fills the barrel as it filled the suction-pipe. The pressure produced by the downward stroke shuts the valve D, and forces the water in the barrel through the valve E. The succeeding upward stroke carries this water into the pipe above, and again fills the barrel from the suction-pipe. In like manner, every successive upward stroke discharges a body of water equal to the content of the barrel into the pipe above it, and the pump will draw water as long as the action of the piston is continued.

The action of this pump may be more shortly described by saying that the piston withdraws the air from the barrel, and produces a vacuum, into which the water rushes through the suction-pipe impelled by the pressure of the atmosphere on its surface. This atmospheric pressure balances a column of water of about 33 feet in height; so that if the barrel be placed at a greater height than this from the surface of the water in the well, the water will not rise into it, and the pump will not draw.

With regard to its efficiency—that is to say, the relation between

Fig. 3.

Fig. 4.

The water is drawn up into the barrel by suction in the manner just described in the suction-pipe, and then the pressure of the piston in its downward-stroke forces it through the valve E to any height that may be required. That shown in fig. 4 is pro-

Fig. 5.

Fig. 6.—Murray's Chain-pump.

vided with a different description of piston, called the plunger-pole. Its action is precisely the same as that of the other, with this exception, that the plunger-pole, instead of emptying the barrel at every stroke, merely drives out that quantity which it displaces by its volume. It is simply a solid rod of metal, A, moving through a water-tight stuffing-box, B. This stuffing-box is made by placing, on a circular flange of metal, rings of india-rubber or other packing, the inner diameter of which is slightly

less than that of the plunger-hole. On these is placed a ring of metal, and through the whole are passed bolts, which, on being screwed tight, force the packing tightly against the plunger-pole. It possesses many advantages, for the packing can be tightened and repaired without removal of the piston or stoppage of the pump; also, the cylinder is not worn by its action, nor does it require to be accurately bored out, as in the other form of pump.

In these pumps, it will be observed that the water is forced into the ascending pipe or column only on the downward stroke; it will thus be discharged in a series of rushes or jerks. As it is a great object to procure a continuous discharge, both for its convenience, and for the saving of the power wasted by the continual acceleration and retardation of the ascending column, various methods have been used for that purpose. The most common is the reservoir of air, which is an air-tight receptacle fixed vertically on the discharge-pipe; the water forced into the pipe by the down-stroke compresses this air, which, acting as a spring returns this force to the ascending column during the period of the up-stroke, and so, by taking the blow of the entering water, and returning it gradually, equalizes the pressure, and renders the discharge uniform. Another method is the double-action force-pump, by which equal volumes of water are forced into the ascending column by both up and down strokes. An example of this is shown in fig. 5. The solid piston A is worked by a rod B of half the section of the piston itself. During the up-stroke, the upper surface forces a volume of water into the ascending column and the lower surface draws in twice that volume. In the down-stroke, these two volumes are sent through the pipe E into the receptacle C, communicating with the upper face of the piston. One of the volumes fills the space D, which would otherwise be left empty by the descent of the piston; the other volume is sent into the ascending column; so that a volume of water equal to half the content of the barrel is sent into the ascending column by both the up and the down strokes.

A pump exhibited in the International Exhibition of 1862, by Messrs. Farcot and Sons, attains this object in a much more simple manner. In its 'two equal pistons, with valves affording very large water-ways, work parallel to each other in two pump cylinders. During the successive strokes, the first piston draws in water by its upper surface, and delivers it to the ascending column by causing it to traverse the second piston. In its ascending course, the second piston raises in its turn the column of water by its upper face, while the lower face sucks the water, causing it to traverse the first piston.' It will be seen from this description that a valve is placed in each piston, that the cylinders communicate at their base, and that the pistons make their strokes simultaneously. This pump has yielded all the good results promised by its ingenious construction, and it is adopted in the water-supply of Paris.

In spite of the great antiquity of the lift and force pump, it is only of late years that improvements have been introduced into its construction capable of rendering it an efficient machine—that is, one which returns in the shape of water raised, a good proportion of the power applied to it. In 1849, M. Morin found by experiments that the power lost was 55 to 82 per cent.—that is to say, that of the motive-power, 45 per cent. was yielded in the best and 18 in the worst, giving an average of about 30 per cent. In 1851, the jury, reporting on those exhibited in the Great Exhibition, say that it is one of our worst machines, considered in a mechanical sense, as a means of producing a given result with the least possible expense of power. In those exhibited in the International Exhibition of 1862, we find a marked improvement. The jury report that 'a large number of constructors have sought to give the waterways and valves dimensions which render as small as possible the loss of power by friction. They have also sought to give a continuous movement to the ascending column of water, independently of the action of the reservoir of air.'

3. *The Chain-pump.*—This pump is formed in general of plates of wood fastened to an endless iron chain, and moving upwards in a rectangular case or box. Fig. 6 shows an example of this pump, which was exhibited in the International Exhibition of 1862, called 'Murray's Chain-pump;' a pump which is very much used on public works, on account of the ease of its construction and erection, and its admirable efficiency even at considerable heights. In this pump, the friction is reduced by having only 3 or 4 lifts instead of 20 or 30, as was previously the case. The chains pass under a roller, A, at the foot, and are driven by a small pitch-wheel, B, at the top, over which they are conducted, and which is driven by appropriate gearing. The lifts feather in passing over the wheel to the descending side, and only unfold when brought around to the ascending side; thus the pump is enabled to take off the water with the same dip as other pumps. The pump is not liable to be choked, as a back turn of the chain immediately releases any substance getting between the lift and the barrel. The speed is variable, in proportion to the duty required. The speed at which the chain is ordinarily worked is from 200 to 300 feet per minute. The greatest lift yet

made by Murray's chain-pump is 60 feet high; but it is considered that 100 tons of water per minute could be raised 100 feet high. From 10 to 12 feet apart has been found to be the best pitch for the lifts; putting them nearer needlessly increases the friction. Experiments made by Mr. Lovick for the Metropolitan Board of Works, showed that the slip of the lifts which work in the barrel, and are one-eighth of an inch shorter each way than the barrel, averaged 20 per cent. of their motion, and that the useful work done averaged 68 per cent. of the indicator horse-power of the engine working it.

4. *The Centrifugal Pump.*—These pumps, with reference to those previously described, may be called new, as, though they have been in use in one form or another for at least a century, their merits were not brought prominently forward till the year 1851, when the great efficiency of the models exhibited by Messrs. Appold, Gwynne, and Bessemer drew general attention to the subject.

The essential parts of this pump are—1. The wheel to which the water is admitted at the axis, and from which it is expelled at the circumference, by the centrifugal force due to the rotatory motion imparted to it in passing through the rapidly revolving wheel; and 2. The casing or box in which the wheel works, and by which the entering water is separated from that discharged.

Figs. 7 and 8 are a section and plan of a centrifugal pump. The water enters the pump by the supply-pipes A, A, which lead

Fig. 7.

to the central orifices of the wheel B, B; it then passes through the passages C, C, formed by the vanes and the side covering-plates, D, of the wheel. In passing through these passages of the wheel, which is made to revolve by power applied to the shaft E, it acquires a rotatory motion, which still continues when it leaves the circumference of the wheel, and enters the circular whirlpool chamber F; so that the interior of the pump may be looked on as a whirlpool, extending from the axle of the wheel to the circumference of the whirlpool chamber. Into this whirlpool the water is drawn at the central orifice of the wheel, and dis-

Fig. 8.—Thomson's Centrifugal Pump.

charged by the pipe G at the circumference of the whirlpool chamber; and the force with which it is discharged, or the height to which it will rise in the pipe G, is measured by the centrifugal force of the water revolving in the whirlpool.

With reference to the efficiency of these pumps, it is impossible to give any accurate estimate, since as high as 70 per cent. of the applied power is claimed to be returned by forms of the pump shown in figs. 7 and 8, while some other descriptions experimented on in 1851 gave only 18 per cent. of useful effect.

It will be evident, from the above description of the pump, that the height to which the water will be raised depends entirely upon

the speed of revolution of the wheel; and it is by this that the application of centrifugal pumps is limited to comparatively low lifts of say less than 20 feet, as the speed for high lifts requires to be greater than can be conveniently and usefully attained in practice. They are best applied when raising large quantities of water through low lifts. It will also be observed, that on account of the simplicity of their parts, and the absence of valves, they are much less liable than other pumps to be choked by the entrance of solid materials. In some descriptions of this pump, the exterior whirlpool chamber is dispensed with; and to the vanes of the wheel is given such a curvature backwards from the direction of motion, that the water leaving the circumference of the wheel is spouted backwards from the vane-passages with a speed equal to that of the wheel in the opposite direction, so that it has only a radial motion with reference to a fixed object; in other words, that the force is acquired from the radial component of the pressure of the vanes, instead of the centrifugal force of the revolving water. Those pumps, however, give the best results which, as the one above described, combine both actions. In all cases, curved vanes are much superior to straight ones.

5. *The Jet-pump.*—This pump is worked by water-power, and is worthy of notice on account of the extreme simplicity of its parts, and of not requiring the care of an attendant while in operation.

Fig. 9 is a representation of this pump, C is the water which it is required to raise to the level of the water D, and B is the water in the stream available for working the pump. The water B passes down the pipe A, and is discharged from the jet or nozzle, E, into the conical pipe F. Round the nozzle is the vacuum-chamber G, at the bottom of which is attached the conical pipe F, and into the side of which the suction-pipe H enters from the water to be pumped. The water, in passing from the nozzle into the conical pipe, carries air with it, and so gradually forms a vacuum in the chamber G, when the water rises into it from the level C, through the pipe H; and it is in turn carried with the jet down the conical pipe into the discharge-level D. The velocity of the water coming from the jet is gradually retarded by the action of the conical pipe, the speed decreasing as the area of section in-

Fig. 9.

creases; and the *vis viva* of its motion is by this retardation converted into a sucking force, drawing the water from the suction-pipe through the vacuum chamber into the conical pipe. The water issuing from the jet will have a speed equal to that produced by a column of the height BC, or the sum of the fall and lift. This pump may be viewed, for purposes of explanation, as a syphon, into the shorter leg of which a jet of water is injected, which overcomes the pressure due to the difference of levels, and reverses the ordinary motion of the water in a syphon. An efficiency of 18 per cent. has been obtained from this pump, which is low, as compared with that obtained from other descriptions of pump; yet in cases where waste of water-power is not so much to be avoided as expense in erecting, working, and maintenance, these pumps possess decided advantages. The case to which they are peculiarly applicable is the drainage of marshes, which have streams of water adjacent to them descending from a higher level.

PUN is the name given to a play upon words. The wit lies in the equivocal sense of some particular expression, by means of which an incongruous, and therefore ludicrous idea is unexpected-

edly shot into the sentence. One or two examples will make the matter clearer than any definition. Two persons looking at a beggar-boy with an extraordinary big head—'What a tower!' cried the first. 'Say, rather,' replied the second, 'what a *fort o' lice*!' (fortalice).—A noted punster was once asked, with reference to Mr. Carlyle's writings, if he did not like 'to expatiate in such a field.' 'No,' was the felicitous rejoinder; 'I can't get over the *style*!' (stile).—A Massachusetts lady complaining to a friend that her husband (whose business had taken him to the far West) constantly sent her letters filled with expressions of endearment, but no money, was told, by way of comfort, that he was giving her a proof of his *unremitting* affection.

PUNCH, the chief character in a popular comic exhibition performed by means of *Puppets* (q. v.). Various accounts are given of the origin of the name. The exhibition is of Italian origin, and the Italian name is *Pulcinella*, or *Policinella*. According to one story, a peasant, a well-known character in the market-place of Naples, got the name *Pulcinella* from dealing in fowls (*pulcinelli*), and after his death was personated in the puppet-shows of the San-Carlino theater. Another account makes the word a corruption of *Puccio d'Auiello*, the name of a witty buffoon of Acerra who joined a company of players and became the favorite of the Neapolitan populace. Others give his original name as Paolo Cinella. The variety and inconsistency of the legends show them to be myths—histories invented to account for the name. The modern P. is only a modification of an ancient Mask (q. v.) to be seen represented on ancient vases, and taken perhaps from the Oscan *Atellane*; and the Italian name is pretty evidently a diminutive of *pollice*, the thumb—Tom Thumb (the dwarfs of northern mythology are sometimes styled *dümming*, thumkins). The English name *Punch* is apparently identical with Eng. *paunch*; Bavarian *punzen*, a cask; Ital. *punzione*, a puncheon; and denotes anything thick and short (e. g., a Suffolk *punch*). The name *Punchinello* seems to have arisen from blending the English and Italian names.

The drama or play in which the modern P. figures, is ascribed to an Italian comedian, Silvio Fiorillo, about 1600. The exhibition soon found its way into other countries, and was very popular in England in the 17th century. Its popularity seems to have reached its height in the time of Queen Anne, and Addison has given in the *Spectator* a regular criticism of one of the performances. The scenes as now given by the itinerant exhibitors of the piece are much shortened from what were originally performed, in which allusions to public events of the time were occasionally interpolated. The following is an outline of the plot as performed in 1813. Mr. P., a gentleman of great personal attraction, is married to Mrs. Judy, by whom he has a lovely daughter, but to whom no name is given in this piece, the infant being too young to be christened. In a fit of horrid and demoniac jealousy, P., like a second Zeluco, strangles his beauteous offspring. Just as he has completed his dreadful purpose, Mrs. Judy enters, witnesses the brutal havoc, and *exit* screaming; she soon returns, however, armed with a bludgeon, and applies it to her husband's head, 'which to the wood returns a wooden sound.' P. at length exasperated seizes another bludgeon, soon vanquishes his already weakened foe, and lays her prostrate at his feet; then seizing the murdered infant and the expiring mother, he flings them both out of the window into the street. The dead bodies having been found, police-officers enter the dwelling of P., who flies for his life, mounts his steed; and the author neglecting, like other great poets, the confining unities of time and place, conveys his hero into Spain, where, however, he is arrested by an officer of the terrible Inquisition. After enduring the most cruel tortures with incredible fortitude, P., by means of a golden key, opens his prison-door, and escapes. The conclusion of the story is satirical, allegorical, and poetical. The hero is first overtaken by Weariness and Laziness in the shape of a black dog, which he fights and conquers; Disease, in the disguise of a physician, next arrests him; but P. 'sees through the thin pretence,' and dismisses the doctor with a few derogatory kicks. Death at length visits the fugitive; but P. lays about his skeleton carcass so lustily, and makes the bones of his antagonist rattle so musically with a *bastinado*, that 'Death his death's blow then received.'

Last of all comes the Devil; first under the appearance of a lovely female, but afterwards in his own natural shape, to drag the offender to the infernal regions, to expiate his dreadful crimes. Even this attempt fails, and P. is left triumphant over Doctors, Death, and the Devil. The curtain falls amid the shouts of the conqueror, who, on his victorious staff, lifts on high his vanquished foe.

The well-marked peculiarities in the original personification of P., which were a high back, distorted breast, and long nose, were intended to give an increased zest to his witticisms; but these features have been much exaggerated in the now so well-known illustrations of the popular periodical which bears his name.

The performance of P., as generally represented, requires the

assistance of only two persons—one to carry the theater and work the figures, the other to bear the box of puppets, blow the trumpet, and sometimes keep up the dialogue with the hero of the piece. The movements of the puppets are managed simply by putting the hands under the dress, making the second finger and thumb serve for the arms, while the forefinger works the head.

PUNCH, or the LONDON CHARIVARI, the English comic journal par excellence, is a weekly magazine of wit, humor, and satire in prose and verse, copiously illustrated by sketches, caricatures, and emblematical devices. It draws its material as freely from the most exalted spheres of foreign politics as from the provincial nursery; and, dealing with every side of life is not less observant of the follies of Belgravia than of the peculiarities of Whitechapel. P. gives due place to Irish bulls and dry Scotch humor, and does its best to present them in the raciest vernacular.

Stern in the exposure of sham and vice, P. is yet kindly when it makes merry over innocent foibles. Usually a *censor morum* in the guise of Joe Miller, a genial English Democritus who laughs and provokes to laughter, P. at times weeps with those that weep, and *jocis remotis*, pays a poetical tribute to the memory of the departed great. This wittiest of serial prints was founded in 1841, and, under the joint editorship of Mark Lemon and Shirley Brooks soon became a household word, while erelong its satirical cuts and witty rhymes were admittedly a power in the land. P. is recognized as an English institution, and in corners of Europe where an Englishman rarely comes, the frequenters of the café may be seen puzzling over the esoteric wit and wisdom of Cock-aigue. Their contributions to P. helped to make Douglas Jerrold (q. v.), Tom Hood (q. v.), Albert Smith, and Thackeray (q. v.) famous; as their illustrations have done for Doyle, Leech, Tenniel, Du Maurier, and Keene. It should be noted that our comic paper has done memorable service in purifying the moral standard of current wit in England. For the alternative name, see CHARIVARI.

PUNCH, a beverage introduced into England from India, and so called from being usually made of five (Hindu, *pantsh*) ingredients—arrack, tea, sugar, water, and lemon-juice. As now prepared, punch may be described as a drink, the basis of which is alcohol, of one or more kinds, diluted with water, flavored with lemon or lime-juice and spices, and sweetened with sugar; sometimes other ingredients are added according to taste, especially wine, ale, and tea. The mixture is usually compounded in a large china bowl made for the purpose, and is served out in glasses by means of a ladle. It is much more rarely seen now than formerly, which is not to be regretted, for a more unwholesome or intoxicating beverage could hardly be compounded. The ordinary mixed punch consists of the following ingredients: the juice of three lemons squeezed out into a large jug, and one lemon cut in slices, with the rind on for flavor, twelve ounces of loaf-sugar, and two quarts of boiling water; after being infused half an hour, and strained off, the liquid is poured into the punch-bowl, and half a pint of rum and of brandy are added. A favorite mode of drinking this composition at present is as a liqueur after fish at dinner, for which purpose it is bottled, and when wanted, is iced, either by placing the bottles in rough ice, or by pounding and mixing in fine ice. The principal varieties of punch, in addition to this, are rum, gin, and brandy punches, in which only one of the spirits mentioned is used, and champagne, milk, orange, raspberry, tea, wine punches.

PUNCH, a tool for cutting circular or other shaped pieces out of metal, wood, or other materials. The simplest form of this instrument is shown in fig. 1, which consists of a piece of steel

Fig. 1.

formed at one end into a hollow cylinder, *a*, the end of which at *b* is ground to a very sharp cutting edge. The other end of the punch at *c* is made strong and thick, to receive blows from a hammer, and to serve as a handle. When the instrument is in use, the cutting-edge, *a*, is applied to the surface which is to be perforated, and a blow sufficiently hard is struck on the end of the

Fig. 2.

handle, *c*, when a circular piece of the material is cut out and left in the hollow part, *a*, which can be removed at the upper end of the opening at *d*. The mode of manufacturing such tools is very simple. A piece of square steel-bar is taken, the thickness of which must correspond with the thickness of the handle at *c*, fig. 1, for

which fig. 2 may be taken as the commencement. This is brought up to a sufficient heat in the furnace, and is then beaten or rolled laterally so as to have the shape in fig. 3. In the next stage, the

Fig. 3.

edges, *a*, fig. 4, are brought up; and finally, a mandril is put into the groove thus made, and the edges are brought together, and welded; the mandril is then withdrawn, and the tool goes to be ground and finished. It will be obvious that, by skill, punches may be made which will make holes of almost any shape.

Fig. 4.

The enormous development of our iron manufactures has necessitated the use of machine-tools in the place of those made for the hand, and none of the very ingenious inventions for this purpose have played a much more important part than the *punching-machines*, for without them the labor of drilling holes in iron plates for such objects as steam-boilers, iron ships, bridges, and other great works, would have been so great as to have effectually prevented them from being undertaken. The punching-machine invented by Messrs. Roberts and Nasmyth, with recent modifications and improvements, is in very general use in all our great engineering works; its essential parts are the punch, lever, and the spring. The punch is simply a piece of tough, hard steel of a cylindrical form, and of the size of the intended hole; it fits into a socket, which is suspended over a fixed iron plate or bench, which has a hole exactly under the punch, and exactly fitting it. In the socket which holds the punch is a coiled iron spring, which holds up the punch, and allows it to descend when the power is applied, and returns it when the pressure is relieved. The lever, when in action, presses on the top of the punch, and the plate of metal which is to be perforated being placed on an iron bench, receives the pressure of the punch with sufficient force to press out a disc of metal exactly the diameter of the punch, which falls through the hole in the iron bench. The lever is moved by a cam on a powerful wheel, which presses upon it until it can pass; then the lever being relieved, the punch is drawn up by the spring in its socket, ready to receive the action of the cam when the revolution of the wheel again brings it to bear on the lever. The punch itself is always solid, differing entirely in this respect from the hand-tools. This useful machine will perforate thick plates of iron, such as are used for shipbuilding, almost as quickly as a workman, with an ordinary hand-punch could perforate thin plates of tin; the holes made are quite true, and are ready to receive the rivets.

PUNCTUATION, the division of a writing into sentences, and the subdivision of these into parts by means of certain marks called *points*, a great help to the clear exhibition of the meaning and to the pleasant reading of what is written. The ancients were not acquainted with the use of points, or used them very little, and only for oratorical purposes. Punctuation, according to the grammar and sense, is said to have been an invention of the Alexandrian grammarians, Aristophanes; but was so much neglected and forgotten, that Charlemagne found it necessary to ask Warnefried and Alcuin to restore it. It consisted at first of a point called the *stigma*, and sometimes a line, variously formed and introduced. The system of punctuation now in use was introduced by the Venetian printer, Manutius, in the latter part of the 15th c.; the example was soon and generally followed, and little change has since been found requisite.

PUNDERPU'R, or PANDHARPUR, a town of British India, in the district of Sholapur, and presidency of Bombay, 90 miles east from Satara, on the right bank of the Bima, a large branch of the Kistna. It is highly revered by the Hindus, on account of a celebrated temple dedicated to an incarnation of Vishnu. Pop (1872) 16,275.

PUN'DLER, the name which in Scotland used to be given to a person employed on an estate as hedger, ditcher, forester, and general guardian, in absence of the proprietor. The office of a pundler was probably analogous to that of poynder. In a few cases, the term pundler is still employed.

PUNIC WARS, the name commonly given to the three great wars waged for supremacy between Rome and Carthage. The Latin word *punicus* or *panicus*, was the name given by the Romans to the Carthaginians, in allusion to their Phœnician descent. For

an outline of the struggle between the two rival powers, see **CARTHAGE, ROME, HAMILCAR, HANNIBAL, and the SCIPIOS.**—The Romans, who believed, not without reason that the Carthaginians never sincerely meant to keep any treaty of peace, employed the phrase *punica fides*, 'Punic faith,' to denote a false and faithless spirit.

PUN'ICA. See **POMEGRANATE.**

PUNISHMENT, in this country, usually means the deprivation of property or liberty, or the infliction of pain on the body of one who commits a criminal offence. It is not applicable, generally, to civil actions, though these are also followed with the compulsory payment of money, and failing which, with the deprivation of property and liberty. As the legal consequence of crimes, punishment consists chiefly of the infliction of pain on the body, and this ranges from capital punishment or death, down to imprisonment for a term of years, and, in some cases, whipping is added; and in military and naval offences, flogging. Capital punishment is inflicted only in case of treason and murder (but there are other instances under naval or army discipline), and in the form of Hanging (q. v.). In crimes of less degree, imprisonment, or Penal Servitude (q. v.) for a term of years, is the punishment. As a general rule, the judge has a discretion to fix the punishment within two defined limits. In the great mass of the smallest crimes, which are cognizable by justices of the peace, and are frequently termed offences punishable summarily, the usual punishment is a fine or penalty, i. e., a sum of money is ordered to be paid by the offender, and if he do not pay it, his goods are sold to make up the sum; failing which, he is committed to the house of correction for a short period of 3, 6, or 12 months; but, in some of the cases, imprisonment and hard labor are imposed in lieu of a fine. The crown can put an end to a sentence of punishment by a free pardon, or may commute a sentence of death to imprisonment for life.

PUNISHMENT, FUTURE. See **HELL.**

PUNISHMENTS, MILITARY AND NAVAL. These, in the British service, include death, by shooting, if for an offence against discipline—or by hanging, if for a disgraceful offence; for serious crimes in the field against discipline, field imprisonment No. I. and No. II. instead of Flogging (q. v.), abolished in 1881; for minor offences, degradation of rank, imprisonment, extra drill, stoppage of grog, loss of good-conduct pay, stoppage of leave, &c. Death, penal servitude, imprisonment, degradation, and loss of leave are the punishments which may be inflicted on an officer. An officer can only be punished by sentence of a court-martial; he may be cashiered, dismissed the service, deprived of his regiment or ship; or, in the navy, reduced in rank by being placed at the bottom of the list of officers of his grade.—In certain of the German armies, punishment is inflicted on the men in the form of strokes with a cane or with the flat of a sabre.

PUN'JAB, or PANJAB (from two Persian words signifying 'five rivers': the *Pentapotamia* of the Greeks), is an extensive territory in the north-west of Hindustan, watered by the Indus, and its five great affluents—the Jhelum, Chenab, Ravi, Beas, and Sutlej, and forms a British-possession since February 1849. It is bounded on the W. by the Suliman Mountains, on the N. by Cashmere, and on the E. and S.E. by the Sutlej, which, in its lower course, is called the Ghara. The extreme length is about 800 miles, and width about 650 miles. The total area is over 200,000 sq. miles, more than half of which is the territory of feudatories. The British possessions are 106,632 square miles, of which less than a third is cultivated. At the census of 1868, the pop. was 17,611,498. At that of 1881, it was 18,850,347; giving an average of 176 to the square mile. The length of roads is 20,798 miles; railways open, 412 miles. The physical character of the northern contrasts strikingly with that of the southern districts. In the north, the whole surface is traversed by spurs from the Himalayas, which enclose deep valleys. In the south, the surface is unbroken by any important eminence, except the Salt Range, varying from 2000 to 5000 feet high, between the Indus and the Jhelum.

The country, divided into five doabs, or interfluvial tracts, and frequently spoken of as the plains of the Indus, has a general slope towards the south-west. The climate in the plains is most oppressively hot and dry in summer, reaching in May 115° to 121° in the shade at several stations; but cool, and sometimes frosty, in winter. Little rain falls except in the districts along the base of the Himalayas. The soil varies from stiff clay and loam to sand; but, in general, is sandy and barren, intermixed with fertile spots. The rivers afford abundant means of irrigation. The indigenous vegetation of the P. is meagre. Trees are few in number and small, and fuel is so scarce, that cow-dung is much used in its stead. With an efficient system of agriculture, however, the territories of this part of India might be rendered very productive. Of the ordinary crops, wheat of excellent quality is

produced in considerable quantities, and indigo, sugar, cotton, tobacco, opium, buckwheat, rice, barley, millet, maize, and numerous vegetables and fruits are grown. The manufacturing industry of this region is very considerable, and is carried on for the most part in the great towns, as Amritsir (q. v.), Lahore (q. v.), Multan (q. v.), &c. Spices and other groceries, dye-stuffs, cloths, metals, and hardware, are imported from the more eastern provinces of British India; and grain, ghee, hides, wool, carpets, shawls, silk, cotton, indigo, tobacco, salt, and horses are exported. The inhabitants are of various races, chiefly Sikhs, Jats, Gujurs, Rajputs and Patans. Of the whole population, nearly two-thirds are Mohammedans; the remaining third is pretty fairly divided between those of the Hindu faith and the Sikhs. There are upwards of 17,000 Europeans in the P. The Jats are the most prominent of the races of the P., and are said to have formed the 'core and nucleus' of the Sikh nation and military force. Of the history of the P., all that is important is given under the heading **SIKHS.**

PUN'KAH, a gigantic fan for ventilating apartments, used in India and tropical climates. It consists of a light frame of wood, covered with calico, from which a short curtain depends, and is suspended by ropes from the ceiling; another rope from it passes over a pulley in the wall to a servant stationed without; the servant pulls the punkah backwards and forwards, maintaining a constant current of air in the chamber.

PUNT, a heavy, oblong, flat-bottomed boat, useful where stability and not speed is needed. Punts are much used for fishing. Some are fitted for oars; but the more usual mode of propulsion is by poles operating on the bottom. Punting is a very laborious exercise.

PUP'A (Lat. a girl, or a doll), the second stage of insect life after the hatching of the egg. The first stage after the egg is that of *Larva* (q. v.). In those insects of which the metamorphosis is complete (see **INSECTS**), the pupa is generally quite inactive, and takes no food. This is the case in the *Lepidoptera*, the pupa of which is called a *Chrysalis* or *Aurelia*, and in the *Coleoptera*, *Hymenoptera*, and *Diptera*. Manifestations of life may indeed be produced by touching, or in any way irritating, the pupa, but it is incapable of locomotion and of eating. It is quite otherwise with the pupæ of other orders, which are often very voracious, and resemble the perfect insect in almost everything but that the wings are wanting. The peculiarities of the pupa are noticed in the articles on the different orders and genera of insects.

PUPIL. See **EYE.**

PUPIL, in the Law of Scotland, means, in the case of a male, one who is under 14 years of age; in the case of a female, one under the age of 12 years.

PUPPET, a name (derived from the Lat. *pupus*, a child or boy, Fr. *poupée*, a doll) signifying a childlike image. The Italian *fantoccini* (from *fantino*, a child), and the French *Marionettes* (q. v.) are other names for puppets. Puppet-plays, or exhibitions in which the parts of the different characters are taken by miniature figures worked by wires, while the dialogues is given by persons behind the scenes, are of very ancient date. Figures with movable limbs have been found in the tombs of ancient Egypt and Etruria. Originally intended to gratify children, they ended in being a diversion for adults. In China and India they are still made to act dramas either as movable figures or as shadows behind a curtain ('*Ombres Chinoises*'). In Italy and France puppet-plays were at one time carried to a considerable degree of artistic perfection, and even Lessing and Goethe in Germany thought the subject worthy their serious attention. In England they are mentioned under the name of *Motions* by many of our early authors, and frequent allusions occur to them in the plays of Shakspeare, Ben Jonson, and the older dramatists. The earliest exhibitions of this kind consisted of representations of stories taken from the Old and New Testament, or from the lives and legends of saints. They thus seem to have been the last remnants of the *Moralities* of the 16th century. We learn from Ben Jonson and his contemporaries that the most popular of these exhibitions at that time were the *The Prodigal Son*, and *Nineveh with Jonas and the Whale*. Even the Puritans, with all their hatred of the regular stage, did not object to be present at such representations. In the reign of Queen Elizabeth puppet-plays were exhibited in Fleet Street and Holborn Bridge—localities infested by them at the period of the Restoration. The most noted exhibitions of the kind were those of Robert Powell in the beginning of the 18th century. (See Chambers's *Book of Days*, vol. ii. 167). So recently as the time of Goldsmith, scriptural 'Motions' were common, and, in *She Stoops to Conquer*, reference is made to the display of Solomon's Temple in one of these shows. The regular performances of the stage were also sometimes imitated; and Dr. Samuel Johnson has observed that puppets were so capable of representing even the plays of Shakspeare, that *Macbeth* might be represented by them as well as by living

actors. These exhibitions, however, much degenerated, and latterly consisted of a wretched display of wooden figures barbarously formed, and decorated without the least degree of taste or propriety, while the dialogues were jumbles of absurdities and nonsense.

The mechanism of puppet-plays is simple. The exhibitor is concealed above or below the stage, works the figures by means of wires, and delivers the dialogues requisite to pass between the characters. The exhibition of Punch (q. v.) is perhaps the only example of this species of acting which exists in this country at the present time.

PURĀN'A (literally 'old,' from the Sanscrit *purā*, before, past) is the name of that class of religious works which, besides the Tantras (q. v.), is the main foundation of the actual popular creed of the Brahminical Hindus (see HINDU RELIGION under INDIA). According to the popular belief, these works were compiled by Vyāsa (q. v.), the supposed arranger of the *Vedas* (q. v.), and the author of the *Mahābhārata* (q. v.), and possess an antiquity far beyond the reach of historical computation. A critical investigation, however, of the contents of the existing works bearing that name must necessarily lead to the conclusion, that in their present form they do not only belong to a remote age, but can barely claim an antiquity of a thousand years. The word *Purān'a* occurs in some passages of the *Mahābhārata*, the law-books of Yājñavalkya and Manu (q. v.); it is even met with in some *Upanishads* and the great Brāhman'a portion of the White-Yajur-Veda; but it is easy to show that in all these ancient works it cannot refer to the existing compositions called P., and therefore that no inference relative to the age of the latter can be drawn from that of the former, whatever that may be. Nevertheless, it must be admitted that there are several circumstances tending to show that there existed a number of works called P., which preceded the actual works of the same name, and were the source whence these probably derived a portion of their contents. The oldest known author of a Sanscrit vocabulary, Amara-Siṃha, gives as a synonym of P. the word *Panchalakṣaṇa* a, which means 'that which has five (*pañcan*) characteristic marks' (*lakṣaṇa*); and the scholiasts of that vocabulary agree in stating that these *lakṣaṇa*s are:

1. Primary creation, or cosmogony; 2. Secondary creation, or the destruction and renovation of worlds; 3. Genealogy of gods and patriarchs; 4. *Mamantaras*, or reigns of Manus; and 5. The history of the princes of the solar and lunar races. Such, then, were the characteristic topics of a P. at the time, if not of Amara-Siṃha himself—which is probable—at least of his oldest commentators. Yet the distinguished scholar most conversant with the existing Purān's, who, in his preface to the translation of the *Viṣṇu*-P., gives a more or less detailed account of their chief contents (Professor H. H. Wilson), observes, in regard to the quoted definition of the commentators on Amara-Siṃha, that in no one instance do the actual Purān's conform to it exactly; that 'to some of them it is utterly inapplicable; to others, it only partially applies.' To the *Viṣṇu*-P., he adds, it belongs more than to any other P.; but even in the case of this P. he shows that it cannot be supposed to be included in the term explained by the commentators. The age of Amara-Siṃha is, according to Wilson, the last half of the century preceding the Christian era; others conjecture that it dates some centuries later. On the supposition, then, that Amara-Siṃha himself implied by *Pancha-lakṣaṇa* the sense given to this term by his commentators, there would have been Purān's about 1900 or 1600 years ago; but none of these have descended to our time in the shape it then possessed.

Various passages in the actual Purān's furnish proof of the existence of such elder Purān's. The strongest evidence in this respect is that afforded by a general description given by the *Matsya*-P. of the extent of each of the Purān's (which are uniformly stated to be 18 in number), including itself; for, leaving aside the exceptional case in which it may be doubtful whether we possess the complete work now going by the name of a special P., Professor Wilson, in quoting the description from the *Matsya*-P., and in comparing with it the real extent of the great majority of Purān's, the completeness of which, in their actual state, does not admit of a reasonable doubt, has conclusively shown that the *Matsya*-P. speaks of works which are not those we now possess. We are then bound to infer that there have been Purān's older than those preserved, and that their number has been 18, whereas, on the contrary, it will be hereafter seen that it is very doubtful whether we are entitled to assign this number to the actual P. literature.

The modern age of this latter literature, in the form in which it is known to us, is borne out by the change which the religious and philosophical ideas, taught in the epic poems and the philosophical Sūtras, have undergone in it; by the legendary detail into which older legends and myths have expanded; by the numerous religious rites—not countenanced by the Vedic or epic works—which are taught, and, in some Purān's at least, by the histori-

cal or quasi-scientific instruction which is imparted, in it. To divest that which, in these Purān's, is ancient, in idea or fact, from that which is of parasitical growth, is a task which Sanscrit philology has yet to fulfil; but even a superficial comparison of the contents of the present P. with the ancient lore of Hindu religion, philosophy, and science, must convince every one that the picture of religion and life unfolded by them is a caricature of that afforded by the Vedic works, and that it was drawn by priestcraft, interested in submitting to its sway the popular mind, and unscrupulous in the use of the means which had to serve its ends. The plea on which the composition of the Purān's was justified even by great Hindu authorities—probably because they did not feel equal to the task of destroying a system already deeply rooted in the national mind, or because they apprehended that the nation at large would remain without any religion at all, if, without possessing the Vedic creed, it likewise became deprived of that based on the Purān's—this plea is best illustrated by a quotation from Śāyana's, the celebrated commentator on the three principal *Vedas*. He says (*Rīgo*, ed. Müller, vol. i. p. 33): 'Women and S'ūdras, though they, too, are in want of knowledge, have no right to the Veda, for they are deprived of (the advantage of) reading it in consequence of their not being invested with the sacred cord; but the knowledge of law (or duty) and that of the supreme spirit arises to them by means of the Purān's and other books (of this kind).' Yet to enlighten the Hindu nation as to whether or not these books—which sometimes are even called a fifth Veda—teach that religion which is contained in the *Vedas* and *Upanishads*, there would be no better method than to initiate such a system of popular education as would reopen to the native mind those ancient works, now virtually closed to it.

Though the reason given by Śāyana's, as clearly results from a comparison of the Purān's with the oldest works of Sanscrit literature, is but a poor justification of the origin of the former, and though it is likewise indubitable, that even at his time (the middle of the 15th C.A.D.), they were, as they still are, not merely an authoritative source of religion for 'women and S'ūdras,' but for the great majority of the males of other castes also, it nevertheless explains the great variety of matter of which the present Purān's are composed, so great and so multifarious indeed, that, in the case of some of them, it imparts to them a kind of cyclopædical character. They became, as it seems, the source of all popular knowledge; a substitute to the masses of the nation, not only for the theological literature, but for scientific works, the study of which was gradually restricted to the leisure of the learned few. Thus, while the principal subjects taught by nearly all the P. are cosmogony, religion, including law, and the legendary matter which, to a Hindu, assumes the value of history, in some of them we meet with a description of places, which gives to them something of the character of geography; while one, the *Āgni*-P., also pretends to teach archery, medicine, rhetoric, prosody, and grammar; though it is needless to add that the teaching has no real worth.

One purpose, however, and that a paramount one, is not included in the argument by which Śāyana's endeavored to account for the composition of the Purān's—it is the purpose of establishing a sectarian creed. At the third phase of Hindu Religion (q. v.), two gods of the Hindu pantheon especially engrossed the religious faith of the masses, Viṣṇu (q. v.) and Ś'iva (q. v.), each being looked upon by his worshippers as the supreme deity, to whom the other as well as the remaining gods were subordinate. Moreover, when the power or energy of these gods had been raised to the rank of a separate deity, it was the female Ś'akti, or energy, of Ś'iva, who, as Durgā, or the consort of this god, was held in peculiar awe by a numerous host of believers. Now, apart from the general reasons mentioned before, a principal object, and probably the principal one of the Purān's, was to establish, as the case might be, the supremacy of Viṣṇu or Ś'iva, and it may be likewise assumed of the female energy of Ś'iva, though the worship of the latter belongs more exclusively to the class of works known as Tantras. There are, accordingly, *Vaiṣṇava*-Purān's, or those composed for the glory of Viṣṇu, *S'iva*-P., or those which extol the worship of Ś'iva; and one or two Purān's, perhaps, but merely so far as a portion of them is concerned, will be more consistently assigned to the Ś'ākta worship, or that of Durgā, than to that of Viṣṇu or Ś'iva.

'The invariable form of the Purān's,' says Professor Wilson, in his *Preface to the Viṣṇu*-Purān'a, is that of a dialogue in which some person relates its contents in reply to the inquiries of another. This dialogue is interwoven with others, which are repeated as having been held, on other occasions, between different individuals, in consequence of similar questions having been asked. The immediate narrator is commonly, though not constantly, Lomaharṣana, or Romaharṣana's, the disciple of Vyāsa, who is supposed to communicate what was imparted to him by his preceptor, as he had heard it from some other sage. . . . Lomaharṣana is called Sūta, as if it was a proper name; but it is, more correctly, a title; and Lomaharṣana's was "a Sūta," that

is, a bard or panegyrist, who was created, according to the *Vishn'u-Purān'a*, to celebrate the exploits of princes, and who, according to the *Vāyu* and *Padma Purān'as*, has a right, by birth and profession, to narrate the Purān'as, in preference even to the Brahmins.¹

The number of the actual Purān'as is stated to be 18, and their names, in the order given, are the following: 1. *Brahma*; 2. *Padma*; 3. *Vishn'u*; 4. *S'iva*; 5. *Bhāgavata*; 6. *Nārāḍiya*; 7. *Mārkan'd'eya*; 8. *Agni*; 9. *Bhaviṣṭya*; 10. *Brahma-cārvarta*; 11. *Linga*; 12. *Varāha*; 13. *Skanda*; 14. *Vāmana*; 15. *Kūrma*; 16. *Matsya*; 17. *Garud'a*; and *Brahmān'da-Purān'a*. In other lists, the *Agni-P.* is omitted, and the *Vayu-P.* inserted instead of it; or the *Garud'a* and 18. *Brahmān'da* are omitted, and replaced by the *Vayu* and *Nr'isinha Purān'as*. Of these Purān'as 2, 3, 5, 6, 10, 12, 17, and probably 1, are Purān'as of the Vaisn'ava sect; 4, 8, 11, 13, 15, 16, of the S'iva sect; 7 is, in one portion of it, called *Devināhātmya*, the text-book of the worshipers of Durgā; otherwise, it has little of a sectarian spirit, and would therefore neither belong to the Vaisn'ava nor to the S'iva class; 14, as Professor Wilson observes, 'divides its homage between S'iva and Vishn'u with tolerable impartiality; it is not connected, therefore, with any sectarian principles, and may have preceded their introduction.' The *Bhaviṣṭya-P.* (9), as described by the *Matsya-P.*, would be a book of prophecies; but the *Bhaviṣṭya-P.* known to Professor Wilson consists of five books, four of which are dedicated to the gods Brahmā, Vishn'u, S'iva, and Twashtri; and the same scholar doubts whether this work could have any claim to the name of a P., as its first portion is merely a transcript of the words of the first chapter of Manu, and the rest is entirely a manual of religious rights and ceremonies. There are similar grounds for doubt regarding other works of the list.

If the entire number of works, nominally, at least, corresponding with those of the native list, were taken as a whole, their contents might be so defined as to embrace the five topicsphilosophical speculation on the nature of matter and soul, individual as well as supreme; small codes of law; descriptions of places of pilgrimage; a vast ritual relating to the modern worship of the gods; numerous legends; and, exceptionally, as in the *Agni-P.*, scientific tracts. If taken, however, individually, the difference between most of them, both in style and contents, is so considerable that a general definition would become inaccurate. A short description of each P. has been given by the late professor H. H. Wilson, in his preface to his translation of the *Vishnu-P.*; and to it, as well as to the detailed account of some Purān'as in separate essays (collected in his works), we must therefore refer the reader who would wish to obtain a fuller knowledge of these works.—The age of the P., though doubtless modern, is uncertain. The *Bhāgavata*, on account of its being ascribed to the authorship of the grammarian Vopadeva, would appear to yield a safer computation of its age than the rest; for Vopadeva lived in the 12th c., or, as some hold, 13th c., after Christ; but this authorship, though probable, is not proved to a certainty. As to the other Purān'as, their age is supposed by Professor Wilson to fall within the 12th and 17th centuries of the Christian era, with the exception, though, of the *Markan'd'eya-P.*, which, in consideration of its unsectarian character, he would place in the 9th or 10th century. But it must be borne in mind that all these dates are purely conjectural and given as such by the scholar whose impressions they convey.

Besides these eighteen Purān'as or great Purān'as, there are minor or *Upapurān'as*, 'differing little in extent or subject from some of those to which the title of Purān'a is described.' Their number is given by one Purān'a as four; another, however, names the following 18: 1. *Sanatkumara*; 2. *Narasinha*; 3. *Nārāḍiya*; 4. *S'iva*; 5. *Durvasasa*; 6. *Kapila*; 7. *Manava*; 8. *Ausanasas*; 9. *Varun'a*; 10. *Kalika*; 11. *S'amba*; 12. *Nandi*; 13. *Sauva*; 14. *Paras'ara*; 15. *Aditya*; 16. *Mahes'wara*; 17. *Bhagavata* (probably, however, a misreading for *Bhargava*); and 18. *Vas'istha-Upapurān'a*. Another list, differing from the latter, not in the number, but in the names, of the *Upapurān'as*, is likewise given in Professor Wilson's *Preface to the Vishn'u-Purān'a*. Many of these *Upapurān'as* are apparently no longer procurable, while other works so called, but not included in either list, are sometimes met with; for instance, a *Mudgala* and *Ganes'a Upapurān'a*. The character of the *Upapurān'as* is, like that of the Purān'as, sectarian; the *S'iva-Upapurān'a*, for instance, inculcates the worship of S'iva, the *Kalika-Upapurān'a* that of Durgā or Devi.

Both Purān'as and *Upapurān'as* are for a considerable portion of their contents largely indebted to the two great epic works, the *Mahabharata* (q. v.) and *Ramayana* (q. v.), more especially to the former of them. Of the Purān'as, the original text of three has already appeared in print: that of the *Bhagavata* in several native editions, published at Bombay, with the commentary of S'rīdharaswāmin, and partly in a Paris edition by Eugène Burnouf, which remained incomplete through the premature death of that distinguished scholar; that of the *Markan'd'eya-P.*, edited

at Calcutta in the *Bibliotheca Indica*, by the Rev. K. M. Banerjea; and that of the *Linga-P.*, edited at Bombay; for, regarding a fourth, the *Garud'a-P.*, edited at Benares and Bombay, it seems doubtful whether that little work is the same as the P. spoken of in the native list. Besides these, small portions from the *Padma*, *Skanda*, *Bhaviṣṭyottara*, *Markan'd'eya*, and other Purān'as have been published in India and Europe. Of translations, we have only to name the excellent French translation by Burnouf of the first nine books of the *Bhagavata*, and the elegant translation of the whole *Vishn'u-P.*, together with valuable notes by the late Professor H. H. Wilson, which has recently been republished in his works, in a new edition, amplified with numerous notes, by Professor F. E. Hall.—For general information on the character and contents of the Purān'as, see especially Wilson's preface to his translation of the *Vishn'u-P.* (Works, vol. vi., Lond. 1864), Burnouf's preface to his edition of the *Bhagavata* (Paris, 1840), Wilson's *Analysis of the Purān'as* (Works, vol. iii. Lond. 1864, edited by Professor R. Rost), K. M. Banerjea's *Introduction to the Markan'd'eya* (Calcutta, 1862), and John Muir's *Original Sanscrit Texts on the Origin and History of the People of India*, vols. 1—5 (Lond. 1858—1871).

PURBECK, ISLE OF, a district in the south of Dorsetshire, 14 miles in length from west to east, and 7 miles in breadth, is bounded on the N. by the river Frome and Poole Harbor, on the E. and S. by the English Channel, and on the W. by the stream of Luckford Lake, which, rising in the park of Lulworth Castle, flows north, and joins the Frome. On the west, however, the water-boundary is not complete, the district being connected with the main portion of the county at East Lulworth; and the so-called Isle of P. is therefore really a peninsula. In ancient times, the Isle of P. was a royal deer-forest. See PURBECK BEDS and PURBECK MARBLE.

PURBECK BEDS, a group of strata forming the upper members of the Oolitic Period (q. v.), and so named because they are well developed in the peninsula called the Isle of Purbeck (q. v.), south of Poole Estuary in Dorsetshire. They are, like the Wealden beds above them, chiefly fresh-water formations; but their organic remains join them more closely to the marine-formed Oolites below, than to the superior Wealden series. Though of a very limited geographical extent, the Purbeck beds have yet considerable importance, from the changes in animal life that took place during their deposition. Generally less than 200 feet in thickness, they, however, exhibit three distinct and peculiar sets of animal remains. This has caused them to be arranged into three corresponding groups, known as the Upper, Middle, and Lower Purbecks.

The Upper Purbecks are entirely fresh-water, and the strata are largely charged with the remains of shells and fish; the cases of the Entomostraca Cyprides are very abundant and characteristic. The building-stone called Purbeck Marble belongs to this division.

The Middle Purbecks record numerous changes during their deposition. The newest of the strata consists of fresh-water limestone, with the remains of Cyprides, turtles, and fish. This rests on brackish water-beds—Cyrena with layers of Corbula and Melania. Below this, there are marine strata, containing many species of sea-shells. Then follow some fresh and brackish-water limestone and shales, which again rest on the cinder-bed, a marine argillaceous deposit, containing a vast accumulation of the shells of a small oyster. This is preceded by fresh-water strata, abounding in the remains of Entomostraca, and containing some beds of cherty limestone, in which little bodies, believed to have been the spore-cases of species of Chara, have been found. At the base of this sub-group, a marine shale occurs, containing shells and impressions apparently of a large Zostera.

The Lower Purbecks begin with a series of fresh-water marls, containing Entomostraca and shells. These rest on strata of brackish-water origin; and then follows a singular old vegetable soil, containing the roots and stools of Cyads, and the stems of coniferous trees. From its black color and incoherent condition, this layer has received from the quarrymen the name of the 'Dirt-bed' (q. v.). This rests on the basement bed of the whole group, which is a fresh-water limestone, charged with Entomostraca and shells, and contains the thin layer in which Mr. Beekles has lately found the remains of several species of mammalia.

PURBECK MARBLE is an impure fresh-water limestone, containing immense numbers of the shells of Paludina, from which it derives its 'figure' when polished. It was formerly much used in the internal decoration of churches and other buildings in the southern counties of England. It is quarried in the peninsula of Purbeck, in Dorsetshire, and belongs to the upper section of the Purbeck Beds (q. v.).

PURCELL, HENRY, the most eminent of English musicians⁺ was born at Westminster in 1658, and was son of Henry Purcell, one of the gentlemen of the Chapel-royal appointed after the restoration. He lost his father at the age of six, and was indebted

for his musical training to Cook, Humphreys, and Dr. Blow. His compositions at a very early age showed evidence of talent. In 1676 he was chosen to succeed Dr. Christopher Gibbons as organist of Westminster Abbey; and in 1682 he was made organist of the Chapel-royal. He wrote numerous anthems and other compositions for the church, which were eagerly sought after for the use of the various cathedrals, and have retained their place to the present day. P.'s dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his music to the *Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to Urfe's *Don Quixote*, &c. A great many of his cantatas, odes, glees, catches, and rounds are yet familiar to lovers of vocal music. In 1683, he composed twelve sonatas for two violins and a bass. P. studied the Italian masters deeply, and often made reference to his obligations to them. In originality and vigor, as well as harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His church music has been collected and edited from the original MS. by Mr. Vincent Novello, in a folio work which appeared in 1826—1836, with a portrait and essay on his life and works. He died of consumption in 1695, and was buried in Westminster Abbey.

PURCHASE-SYSTEM, a highly unpopular and much misunderstood arrangement in the British army, by which a large proportion—more than half—of the first appointments of officers and their subsequent promotion used to be effected. It dates from the first formation of an English standing army, and was formally recognized in the reign of Queen Anne. The system itself was very simple. A price was fixed by regulation for each substantive rank (see **PROMOTION**), viz.—

	Price.	Difference.
Lieutenant-colonel.....	£4500	£1300
Major.....	3200	1400
Captain.....	1800	1100
Lieutenant.....	700	250
Cornet or Ensign.....	450	

When any officer holding one of these regimental commissions desired to retire from the army, he was entitled to sell his commission for the price stipulated in the above table—£4500, in the case of a lieutenant-colonel. This sum was made up by the senior major, who was willing and able to purchase, buying the rank of lieutenant-colonel for £1300; the senior captain, willing and able to purchase, buying a majority for £1400; a lieutenant purchasing his company for £1100; a cornet or ensign becoming lieutenant on payment of £250; and lastly by the sale to some young gentleman of an ensigncy or cornetcy for £450. In practice, fancy prices higher than the above were usually given, according to the popularity of a regiment, and vested interests in these over-regulation prices caused most serious complications whenever the government made any change affecting the promotion of purchase officers. The value of commissions in the Guards was also greater; but as they constitute but a few regiments, and are mostly officered from the nobility, they do not need particular description.

No commission could be purchased by one officer unless another officer vacated his commission by its sale. Death-vacancies, vacancies caused by augmenting a regiment, vacancies resulting from the promotion of colonels to be major-generals, were filled without purchase, usually by seniority. No rank above lieutenant-colonel could be purchased.

It is alleged with truth that purchase enabled the rich man to step over the head of the poorer, but perhaps better-qualified non-purchasing officer; and that money decided where merit should be the only guide. These disadvantages, however, it is replied, were not unmixt. Purchase, it is argued, introduced into the army men of a very high class in society, who gave a tone to the whole of military life. A great proportion of these wealthy men entered with the intention of merely spending a few years in the army. This tended to keep the officers young—a great advantage; and, further, provided in the country, among its gentlemen, a body of men well adapted for commands in the militia and volunteers. Moreover, selection exercised arbitrarily, as it must be when the men from whom the selection is to be made are scattered all over the world, away from the selecting power, is liable to create dissatisfaction. Under purchase, exchange was a common thing; for the rich officers, for private reasons of locality, &c., were glad to change frequently from regiment to regiment, entering in each case at the *bottom* of the list of officers of their rank in their new regiment. This, of course, was an advantage to the non-exchanging officer, as it pushed him to the top; and the first death or other non-purchase promotion then fell to him. An officer who had not purchased at all, might nevertheless sell his commission for its full value if he had served twenty years, or for a sum less than the regulated price after shorter service. This was also a spur to promotion. On the whole, though exposed to the disadvantage and annoyance of being passed over by younger officers,

the non-purchasing, i. e., the poor officers benefited peculiarly by the purchase-system. This is proved by the slow progress officers made in corps where purchase did not exist, as, for instance, in the Royal Marines.

Few would counsel the formation of a new army with such a system as purchase; but, on the other hand, it had its advantages in its working. Purchase did not exist in the artillery, engineers, marines, 19th to 21st regiments of cavalry, or 101st to 109th regiments of foot. The purchase-system was abolished by royal warrant in July 1871; and by the Regulation of the Forces Act of the same year, parliament laid down a scheme for the gradual compensation of officers who had lost their selling rights. Under that scheme, it was estimated that a sum-total amounting to about £12,000,000 would ultimately be required.

PURCHASER. See **SALE**.

PURFLED, or PURFLEWED, in Heraldry, a term used with reference to the lining, bordering, or garnishing of robes or ornamentation of armor.

PURGATION. See **ORDEAL**.

PURGATIVES are medicines which, within a definite and comparatively short time after exhibition, produce the evacuation of the bowels. The remedies included under this head have, however, various modifications of action, which adapt them for the fulfilment of different therapeutic application. They are divided by Pereira into five groups, viz.:

1. *Laxatives*.—A purgative is said to be laxative when it operates so mildly as merely to evacuate the intestines without occasioning any general excitement of the system, or any extraordinary increase of watery secretion from the capillaries of the alimentary canal. This group includes manna, sulphur, cassia pulp, castor oil, &c.; and purgatives of this kind are employed when we wish to evacuate the bowels with the least possible irritation, as in children and pregnant women; in persons suffering from hernia, piles, stricture or prolapsus of the rectum, &c.

2. *Saline or Cooling Purgatives*, such as sulphate of magnesia, and potassio-tartrate of soda, either in simple solution, or in the form of Seidlitz Powder (q. v.). They give rise to more watery evacuations than the members of the preceding group, and are much employed in inflammatory and febrile cases.

3. *Milder Acid Purgatives*, such as senna, rhubarb, and aloes. They possess acid and stimulating properties, and are intermediate in activity between the last and the next group. Senna (generally in the form of Black Draught) is employed when we want an active but not very irritant purgative. Rhubarb is especially adapted for patients when there is a want of tone in the alimentary canal. Aloes is used in torpid conditions of the large intestine; but as this drug irritates the rectum, it should be avoided in cases of piles and of pregnancy, especially if there is any threatening or miscarriage.

4. *Drastic Purgatives*, such as jalap, scammony, gamboge, croton oil, colocynth, and elaterium, when swallowed in large doses, act as irritant poisons, and are employed in medicine when the bowels have resisted the action of milder purgatives, or when we wish to exert a powerful derivative action upon the intestinal mucous membrane (as in cases of apoplexy when croton oil is commonly used), or when it is necessary to remove a large quantity of water from the system, as in dropsical affections, in which case, elaterium, from its hydragogue power, is usually employed.

5. *Mercurial Purgatives*, the chief of which are calomel, blue pill, and gray powder. They are commonly given with the view of increasing the discharge of bile, although their power in this respect has recently been denied. As their action is uncertain, they are usually combined with or followed by other purgatives. Podophyllin (q. v.) has recently been much used for the purpose of exciting bilious evacuations. Hamilton's book *On Purgative Medicines*, which was published more than half a century ago, is still the standard work on the subject of this article.

PURGATORY (Lat. *purgatorium*, from *purgo*, I cleanse) is the name given, in the Roman Catholic and oriental churches, to a place of purgation, in which, according to their religious system, souls after death either are purified from venial sins (*peccata venalia*), or undergo the temporal punishment which, after the guilt of mortal sin (*peccata mortalia*) has been remitted, still remains to be endured by the sinner. The ultimate eternal happiness of their souls is supposed to be secured; but they are detained for a time in a state of purgation, in order to be permitted to appear in that Presence into which nothing imperfect can enter. As there is some obscurity and much misunderstanding on this subject, we shall briefly explain the doctrine of Catholics, as collected from authentic sources, distinguishing those things which are held by them as 'of faith,' from the opinions which are freely discussed in their schools. Catholics hold as articles of their faith (1) that there is a purgatory in the sense explained above, and (2) that the souls there detained derive relief from the prayers of the faithful and from the sacrifice of the mass. The Script-

ural grounds alleged by them in support of this view are 2d Macc. xii. 43–46 (on which they rely, not merely on the supposition of its being inspired, but even as a simple historical testimony), Matt. xii. 32, 1st Cor. iii. 11–15, 1st Cor. xv. 29; as well as on certain less decisive indications contained in the language of some of the Psalms—as xxxvii. (In Anth. Vers. xxxviii.) 1, and lxx. 12. And in all these passages they argue not alone from the words themselves, but from the interpretation of them by the Fathers, as containing the doctrine of a purgatory. The direct testimonies cited by Catholic writers from the Fathers to the belief of their respective ages as to the existence of a purgatory, are very numerous.

We may instance among the Greeks: Clement of Alexandria, *Stromata*, vii. 12; Origen, *Hom.* xvi. c. 5, 6 in *Jeremiam*; vi. *Hom. in Ezech.*; xiv. *Hom. in Levit.*; xxviii. *Hom. in Numb.*; Eusebius, *De Vita Constantini*, iv. 71; Athanasius, *Quest.* xxxiv. *ad Antioch.*; Cyrillus of Jerusalem, *Cat. Mystag.* v. 9; Basil, *Hom. in Psalm.* v. 7; Gregory of Nazianzen, xli. *Orat. de Lavde Athanasii*; Gregory of Nyssa, *Orat. de Bapt.*; as also Epiphanius, Ephrem, Theodoret, and others. Among the Latins: Tertullian, Cyprian, Arnobius, Lactantius, Hilary, Ambrose, and above all, Augustine, from whom many most decisive passages are cited; Paulinus of Nola; and Gregory the Great, in whom the doctrine is found in all the fulness of its modern detail. The epitaphs of the catacombs, too, supply Catholic controversialists with some testimonies to the belief of a purgatory, and of the value of the intercessory prayers of the living in obtaining not merely repose, but relief from suffering, for the deceased; and the liturgies of the various rites are still more decisive and circumstantial. Beyond these two points, Catholic faith, as defined by the Council of Trent, does not go; and the council expressly prohibits the popular discussion of the 'more difficult and subtle questions, and everything that tends to curiosity, or superstition, or savors of filthy lucre.' Of the further questions as to the nature of purgatory, there is one of great historical importance, inasmuch as it constitutes one of the grounds of difference between the Greek and Latin churches. As to the existence of purgatory, both these churches are agreed; and they are further agreed that it is a place of suffering; but, while the Latins commonly hold that this suffering is 'by fire,' the Greeks do not determine the manner of the suffering, but are content to regard it as 'through tribulation.' The decree of union in the Council of Florence (1439) left this point free for discussion. Equally free are the questions as to the situation of purgatory; as to the duration of the purgatorial suffering; as to the probable number of its inmates; as to whether they have, while there detained, a certainty of their ultimate salvation; and whether a 'particular judgment' takes place on each individual case immediately after death. See Bellarminus, *De Purgatorio*; Suarez, *De Purgatorio*; and on the Greek portion of the subject, Leo Allatius, *De utriusque Ecclesie in Dogmate de Purgatorio perpetua Consensione*.

The mediæval doctrine and practice regarding purgatory were among the leading grounds of the protest of the Waldenses and other sects of that age. The Reformers as a body rejected the doctrine.

What is called the 'historical' or 'critical' view of its genesis, is well given by Neander (*Dogmengeschichte*, vol. i.). He conceives that its source is to be sought for in the ancient Persian doctrine of a purifying conflagration which was to precede the victory of Ormuz, and consume everything that was impure. From the Persians it passed with modifications to the Jews, and from them found its way into the ethical speculations of the more cultivated Christians. It harmonized admirably with the wide-spread philosophical notion borrowed by the Gnostic Christians from Neo-Platonism, that matter is inherently evil. If then the *body* was to rise, it must be purged of evil, and the instrument of purification—fire, was at hand for the purpose. Moreover, the high and pure conception of the character of God revealed in the New Testament, necessitating a corresponding moral excellence on the part of his worshippers—'without holiness shall no man see the Lord'—must have greatly assisted in the establishment of the doctrine, for how could men, only lately gross heathens, possessing yet but the rudiments of the new faith, and with most of their heathen habits still clinging about them, be pronounced 'holy' or 'fit for the presence of God?' Their 'faith' in Christ was sufficient to save them, but the work of sanctification was incomplete when they died, and must go on. Probably it was a strong Christian feeling of this sort that determined the reception of the doctrine of purgatory into the creed of the Catholic church rather than any Gnostic philosophisings, though the Neo-Platonic divines of Alexandria are the first to mention it.

Protestants generally reply to the arguments of Roman Catholics on the subject of purgatory, by refusing to admit the authority of tradition or the testimonies of the Fathers, and at the same time by alleging that most—if not all—of the passages quoted from the Fathers, as in favor of purgatory, are insufficient to prove that they held any such doctrine as that now held by the

Roman Catholic Church, some of them properly relating only to the subject of prayer for the dead, and others to the doctrine of Limbus (q. v.). That the doctrine of purgatory is the fair development of that which maintains that prayer ought to be made for the dead, Protestants generally acknowledge, but refuse to admit that the Fathers carried out their views to any such consequence. As to the alleged evidences from Scripture, they are commonly set aside by Protestants as merely ridiculous. The much vaunted argument from the second book of Maccabees, is of course contemned, as being from an apocryphal book, and not one of the best books of the Apocrypha; besides, that the passage relates to nothing more than prayer for the dead. The text Matt. xii. 32, is explained as relating to the final judgment; and 1 Cor. iii. 11–15, as relating to a trial of *works*, and not of persons; whilst 1 Cor. xv. 29 is regarded as having nothing more to do with the subject than any verse taken at random from any part of the Bible.

PURGING NUT. See PHYSIC NUT.

PURIFICATION, in a Biblical sense, is the act through which an individual became fit to approach the Deity, or to mix freely in the community, in cases where a certain bodily or other disability had kept him out of the pale of the latter. The purification consisted chiefly in expiations, ablutions, sometimes accompanied by special sacrifices. Priests and Levites were consecrated for the Divine service by 'purification'; proselytes had to undergo it at baptism; and special religious acts could only be performed by those who had 'bathed their bodies.' Generally, no one was allowed to enter the Temple or synagogue without having washed or 'sanctified' himself; and in the post-exilic period, bathing was considered (chiefly by the Pharisees and Essenes) as one of the chief duties of piety. In general, the Mosaic Law distinguishes between 'clean' and 'unclean' persons as well as things, calling 'unclean' all that with which an Israelite is not to come in contact. It has been erroneously assumed that all the Levitical laws of purity and purification have a physical or medical reason—that is, that infection was to be prevented through them; but this can only have been the case in some instances. At the same time we cannot deny that we are at a loss for the general principle on which they were based. There can be no doubt that cleanness, like every other virtue, if not enforced on religious grounds, would have had few devotees in those days, and among an eastern people; while, again, a hot climate requires a much greater attention to outward purity than more temperate zones. Compared with the Indian and Persian laws in this respect, the Jewish ones seem much less minute and harassing. For the purification from the severer kinds of uncleanness, a certain 'water of uncleanness' (Lev. xv.) was prepared; and the different acts to be performed for the readmission of the leper into the community (Lev. xiv. 4–32), show plainly that his was considered the last stage of impurity. Identical with the first stage of the leper's purification are the ceremonies to be performed in the case of infected houses and garments. The sixth Seder of the Mishnah, in 11 treatises (there is no Gemara to this portion, except to Niddah), contains the most detailed regulations (as fixed by tradition) on this point. The washing of hands, we may add in conclusion, was in later times considered ritually necessary, in accordance with the Talmudical maxim, that 'every table should properly be sanctified into an altar.' See UNCLEANNESS.

All the Jewish ceremonial purifications are commonly regarded by Christian theologians as emblematic of the necessity of holiness in the people of the Lord, and particularly in all acts of worship.

PURIFICATION OF THE BLESSED VIRGIN MARY, FEAST OF, a festival in commemoration of the 'purification' of the Blessed Virgin Mary, in accordance with the ceremonial law of Lev. xii. 2. This ceremony was appointed for the fortieth day after childbirth, which, reckoning from December 25 (the Nativity of our Lord), falls upon February 2, on which day the purification is celebrated. The history of Mary's compliance with the law is related in Luke ii. 22–24; and on the same occasion she complied also with the law of Numb. xviii. 15, by the offering prescribed in redemption of the first-born, the festival is also called by the name of the 'Presentation of the Child Jesus,' or the 'Feast of Simeon,' and sometimes, also, 'of the Meeting' (*occursus*), in allusion to Simeon's meeting the Virgin mother, and taking the child into his arms (Luke ii. 26). The date of the introduction of this festival is uncertain. The first clear trace of it is about the middle of the 5th c., during the reign of Marcia, and in the Church of Jerusalem. Its introduction in the Roman Church in 494, was made, by Pope Gelasius, the occasion of transferring to a Christian use the festivities which at that season were annexed to the pagan festival of the Lupercalia.

PURITANS, a name first given, according to Fuller, in 1564, and according to Strype, in 1569, to those clergymen of the Church of England who refused to conform to its liturgy, ceremonies, and discipline as arranged by Archbishop Parker and

his Episcopal coadjutors. But in point of fact, the Puritan tendency in the Church of England is as old as the church itself; and to seek for its true origin we must go back to the period of Cramer, who, when laying the foundations of English Protestantism in a nation only half-prepared for the change, found it necessary to make concessions to the older religion, and to build the new church on an elaborate system of compromise. This feature of 'Anglicanism'—its essential *broad-churchism*—gave great offence to the stricter and more doctrinal of the English reformers, who neither cared nor were competent to look at the thing from a statesman's point of view. The reign of Edward VI., brief though it was, showed quite clearly that if the party in the English Church who had acquired not only their theology, but their opinions of church-government from Calvin, ever got the upper hand, they would not stop till they had reconstructed, on a much simpler basis, the whole ecclesiastical fabric. The reaction under Mary drove most of them to seek safety in exile on the continent. It was here the first definite step in the history of Puritanism was taken. A number of the exiles resident at Frankfurt determined to adopt the Genevan service-book in preference to that appointed by King Edward, and though their attempt proved a failure, partly on account of the opposition of others of the exiles, yet it showed the pertinacity with which they tried to carry their convictions into practice. On their return to England, after the accession of Elizabeth, the struggle was renewed. But the virile queen would not tolerate their notions, and during her whole reign, punished in the most stringent style all who refused to obey the Episcopal ordinances.

The position assumed by the P. was that the liturgy, ceremonies, and discipline of the Church of England required further reformation; that the church, as then constituted, did not separate itself markedly enough from Roman Catholicism; and that it was desirable, in the interests of religion, to abandon everything that could boast of no other authority than tradition or the will of man, and to follow as far as possible the 'pure' word of God. Hence their name, which was probably given in derision. In spite of the sharpest repressive measures, their principles gradually spread among the serious portion of the laity, who were also called Puritans. But the name appears not to have been confined to those who wished for certain radical changes in the forms of the church. The character that generally accompanied this wish led naturally enough to a wider use of the term; hence, according to Sylvester, 'the vicious multitude of the ungodly called all Puritans that were strict and serious in a holy life, were they ever so conformable.' This is the sense in which the Elizabethan dramatists use the word. From this very breadth of usage, one sees that there were different degrees of Puritanism. Some would have been content with a moderate reform in the rites, discipline, and liturgy of the church; others (like Cartwright of Cambridge) wished to abolish Episcopacy altogether, and to substitute Presbyterianism; while a third party, the Brownists or Independents (q. v.), were out-and-out dissenters, opposed alike to Presbyterianism and Episcopacy.

During the reigns of James I. and Charles I., the spirit of Puritanism continued more and more to leaven English society and the English parliament, although the most violent efforts were made by both monarchs to extirpate it. The tyrannical proceedings of Laud and of the Laudian bishops, and the outrages practised by Charles on the English constitution, led many who were not at all Genevan in their ideas to oppose both church and king for the sake of the national liberties. Hume distinguishes three kinds of P.: 1. The *Political P.*, who disliked the bishops, not so much on ecclesiastical grounds, as on account of their servility towards the king, and their priestly antipathy to civil liberty; 2. The *P. in Church Discipline*, who were for the most part in favor of Presbyterianism; 3. The *Doctrinal P.*, who were strong Calvinists on such points as predestination, free-will, grace, &c., but were not opposed to Episcopacy or to the ecclesiastical authority of the monarch, and who contented themselves with assailing the Arminianism that was encouraged at court. The attitude of this third class was certainly anomalous, and it is not wonderful that they exercised so little influence or control on the march of events in the great civil struggle. The second class was by far the most numerous—at least among the clergy; and at first it seemed as if the clergy were going to have things all their own way. For example, in the memorable 'Westminster Assembly of Divines' (1643), the great majority of the ministers were Presbyterians, and their *Confession of Faith* is quite Presbyterian in spirit. But genius, energy—the arms of victory—belonged to the more advanced P., who were predominant in the army and the parliament, and ultimately triumphed in the person of Cromwell (q. v.).

But the Restoration (1660) brought back Episcopacy, and the Act of Uniformity (1662) threw the P. of the church into the position of dissenters. Their subsequent history is treated under the different forms of dissent. Before the civil war broke out, so great were the hardships to which the P. were exposed,

that many of them emigrated to America, to seek liberty and peace on the solitary shores of the New World. There they became the founders of the New England States, and cultivated unmolested that form of Christianity to which they were attached. Nowhere did the spirit of Puritanism in its evil as well as its good more thoroughly express itself than in Massachusetts and Rhode Island; nor have its traces wholly disappeared even yet. In Scotland, Puritanism, in the shape of Presbyterianism, was from the first the established religion; hence it does not present itself to us in that country as a struggling, suffering, antagonistic, and protesting force; nor, in point of fact, was the name of P. ever given even to the extremest sect of Covenanters.—See Neale's *History of the Puritans*; Price's *History of Nonconformity*; Macaulay's *History of England*; and Dr. Stoughton's *Works*.

PURL, a beverage now little used except among the lower classes in and around London. It is made by warming a pint of ale with a quarter of a pint of milk, and adding some sugar and a wine-glassful of gin, rum, or brandy.

PURLINS, pieces of timber used in framed roofs, between the principals, for the support of the common rafters.

PURMEREND, a flourishing little town in North Holland, 10 miles north of Amsterdam, and on the line of the great canal from that city to the North Sea. Pop. (1880) 5000. It has a large trade in cheese, butter, eggs, cattle, and wood, upwards of 1,500,000 lbs. of cheese being annually sold in the market. In the neighborhood of P. are to be found the richest meadows, the finest cattle, the neatest farmhouses, and the most perfect dairies and cow-stables. P. has also a considerable shipping trade, and imports timber. The town, which has sprung up under the protection of the castle of Purmerstein (built at the beginning of the 15th c.), derives its name from being situated at the end of the Purmer, formerly a sheet of water, by drainage made a fertile tract of land containing 6701 acres.

PURNEAH, a large town of British India, capital of an extensive and populous district of the same name in the presidency of Bengal, on the north bank of the Ganges, stands on both banks of the Little Kosi river, 230 miles north-north-west of Calcutta. It covers a considerable area, but it is not compactly built, there being numerous plantations, gardens, and other open places within the boundaries. Around the town are numerous straggling villages. A considerable quantity of indigo is grown in the vicinity. The civic establishment consists for the most part of Europeans. Pop. (1872) of town, 16,057; of district, 1,714,795.

PURPLE OF CASSIUS, or GOLD PURPLE, a beautiful coloring material of a vitreous character, which was made known in Germany in the 17th c. by an artist named Andrew Cassius, whose father was secretary of the Duke of Schleswig. Its property is to give a beautiful ruby red to glass, and it was therefore, and still is, employed to make imitation rubies. It is made by combining one part of neutral chloride of gold with a mixture of one part of protochloride and two parts of perchloride of tin, all in solution. When mixed together, a beautiful purple precipitate is the result, which is the Purple of Cassius. The French recipe, which is said to be the best, is 10 parts of acid chloride of gold dissolved in 2000 parts of distilled water. To this add a solution, carefully prepared, in another vessel, of 10 parts of pure tin in 20 parts of muriatic acid diluted with 1000 parts of water. On mixing the two, the purple precipitate is thrown down, and is separated by filtering and decantation.

PURPLE COLORS. Painters in oil and water colors produce the various shades of purple by the admixture of pure red and pure blue colors. Dyers obtain this color from various sources, all of which are curious and interesting. From a very early period, purple has been one of the most highly prized of all colors, and came to be the symbol of imperial power. Probably one great reason for this was the enormous cost of the only purple color known to the ancients, the Tyrian purple, which was obtained in minute quantities only from a Mediterranean species of molluscous animal or shell-fish, the *Murex trunculus*, and perhaps also *Purpura lapillus*. In the time of Cicero, wool double-dyed with this color was called *dibapha*, and was so excessively dear, that a single pound-weight cost a thousand denarii, or about £35 sterling. A single murex only yields a small drop of the secretion, consequently very large numbers had to be taken in order to obtain enough to dye even a small amount of wool. Tarentum, the modern Otranto, was one of the great murex fisheries of the Romans, and there they have a number of large dyeing establishments. Vast heaps of the shells have been discovered there, the remains of its former industry. With the decline of the Roman empire, the employment of this purple color ceased, and it was not until a Florentine of the name of Orchilini discovered the dyeing properties of the lichen now called *Orchella Weed*, that a simple purple color was known in Europe. The discovery was kept secret in Italy for nearly a century, and that country supplied the rest of Europe with the prepared dye, which received the name

of Orchil or Archil (q. v.). The color was very fugitive, and soon ceased to be used by itself; it, however, was found very useful in combination, and has a remarkable power of brightening up other colors. Many improvements have been lately made in archil dyeing, especially in fixing it. Its value, however, has been greatly lessened by the discovery of the beautiful series of purples yielded by coal-tar as results of the combination of one of its products called aniline with other bodies. See DYEING.

PURPLE EMPEROR (*Apatura Iris* or *Nymphalis Iris*), one of the largest of British butterflies, and one of the most richly col-

Purple Emperor (larva and pupa shown below).

ored. The expanse of wings is from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches. The wings are strong and thick, and the flight more sustained than that of many butterflies. The P. E. is very often to be seen about the tops of oak trees.

PURPLE WOOD, or **PURPLE HEART**, the heart-wood of *Copaifera pubiflora* and *C. bracteata*, a very handsome wood of a rich plum color. The trees producing it are natives of British Guiana, where the wood is called generally *Marivayana*. The trees are rather rare on the coast, but in the upland forests are common. The chief interest of the wood is its remarkable adaptation to the purposes of artillery and fire-arms. It is said no wood is better adapted for mortar-beds and gun-carriages, as it sustains better than any other the violent concussions to which they are subjected. Its chief use in this country has been for making ramrods for muskets. Its great beauty and smooth grain would insure its extensive employment in cabinet-work in this country, if it were better known.

PURPLES. See **EAR-COCKLES**.

PURPURA, a genus of gasteropodous molluscs, of the family *Buccinidae*. The species are very similar to those of the genus *Buccinum* (see **WHEEL**), but have a less elongated shell, and a flattened columella, which is pointed at the base, and forms there, with the outer lip, a canal excavated as a notch in the shell, and not projecting. The species are numerous, mostly natives of the shores of warm climates. *P. lapillus* is a species pretty common on most parts of the British coast. It is smooth and whitish, with bands of reddish-brown, and sometimes two inches long. It feeds on mussels and other molluscs, boring their shells with its proboscis. The genus is interesting, because some species of it were amongst those which yielded the famous *Tyrian purple* of the ancients. *P. patula* is supposed to have been one of those from which this dye was obtained, but it may have been obtained from others, as *P. lapillus*. The dye is contained in a small veinlike sac near the head. See **PURPLE COLORS**.

PURPURA, or **THE PURPLES**, is a malady which is often erroneously placed amongst the diseases of the skin. It is in reality a blood disease, and is characterized by the appearance of small round spots, of deep purple color, which are seen first and most abundantly on the legs, and afterwards extend to the arms and trunk. They are accompanied by no local pain, are not effaced by pressure (being due to a drop of blood extravasated beneath the cuticle, or in the structure of the skin itself), do not rise above the surrounding surface, and are sometimes intermixed with livid patches resembling bruises, and, before disappearing, both the round spots and the patches undergo the same change of color which a bruise undergoes. These spots are not peculiar to the skin, but occasionally occur upon internal surfaces, and in the tissues of viscera. Passive hæmorrhages from the mucous membranes frequently accompany the external systems. There is usually much debility, and often a great tendency to faintness. The duration of the disease varies from a few days to a year or more. Slight cases are devoid of danger, and even the hæmorrhagic cases usually recover, unless the bleeding has been excessive, or the blood has been extravasated into a vital organ.

The causes of this disease are obscure. The mode of treatment varies in different cases, but the main indication always is to correct the condition of the blood. When there is reason to believe that the disease is dependent upon depressing influences, a nutritious diet, tonics, and stimulants are required; and chalybeates, or the mineral acids, and quinine, with plenty of exercise in the open air, should be prescribed. When, however, there is no evidence of the operation of any debilitating cause, and the pulse is hard, the most efficient treatment consists in abstinence, venesection, and purgatives. In cases of a mixed nature, a mixture of the oil of turpentine and castor-oil, in free doses (2 drachms of the former to 5 or 6 drachms of the latter), and iced drinks, or the sucking of small pieces of ice, have been strongly recommended. If the hæmorrhage is not stopped by the oil of turpentine, gallic acid, or acetate of lead and opium, must be prescribed; and if it proceeds from accessible parts, local measures, such as the employment of ice or strong astringents, should also be employed.

PURPURE, in Heraldry, the color purple expressed in engravings by lines in bend sinister. It is of unfrequent occurrence in British heraldry.

PURPURINE. See **MADDER**.

PURRE. See **DUNLIN**.

PURSE-CRAB (*Birgus*), a genus of *Crustacea*, of the order *Decapoda*, and suborder *Anomoura* (see **CRAB**), allied to Hermit-crabs (q. v.), but having the abdomen or tail shorter and almost orbicular, its under surface soft and membranous, its upper surface covered with strong plates, which overlap one another as in lobsters. The first pair of legs have large and powerful pincers; the pair of legs nearest the abdomen are very small, but terminated by rudimentary pincers; the pair next to them larger, with small pincers; the second and third pair of legs are terminated by a single nail. A species of *P. (B. latro)* is found in Mauritius and in the more eastern islands of the Indian Ocean. It is one of the largest of crustaceans, sometimes two or three feet in length when fully stretched out, and capable of erecting itself to the height of a foot from the ground, which it readily does if irritated, retreating backward, and exhibiting to the utmost its powers of offence or defence. It is of a yellowish-brown color, its limbs covered with little blackish projections.

It is never found far from the sea, to which it is said to pay visits, in order to moisten its gills; but it resides on land, and often in holes under the roots of trees, where it accumulates great quantities of the fibres of the cocoa-nut husk, as if to keep itself warm, or for a soft bed. The Malays rob these stores to supply themselves with junk. The gills of the *P.* are contained in a very large cavity, of which they fill only a very small part. Its food consists of cocoa-nuts and other nuts, which it climbs trees to procure. Its manner of dealing with a cocoa-nut is described as exhibiting a remarkable instinct, as it always begins to tear off the husk at the end where the eyes are. It is variously stated that it makes a hole through the eye from which the nut would germinate, and then scoops out the nut with the small pincers of its fourth pair of legs; and that having made this hole, it seizes the nut by one of its great pincers, and breaks it against a stone. Both statements may perhaps be true.

PURSER, in the Royal Navy, was formerly a warrant, and subsequently a commissioned officer, in charge of the provision, clothing, pay, and necessities of a ship-of-war. His title was changed in 1844 to that of Paymaster (q. v.).

PURSLANE (*Portulaca*), a genus of plants of the natural order *Portulacaceæ*, having a bifid calyx, 4 or six petals, 8 or 16 stamens, and a capsule dividing around the middle. **COMMON P.** (*P. oleracea*) grows in cultivated and waste grounds on the seashore, in almost all tropical and subropical parts of the world. It is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and obovate fleshy leaves, which, as well as the young shoots, are frequently used in salads. The young and tender shoots are pickled in France like gherkins. *P.* is not so common in British gardens as it once was.

PURSUIVANT (Fr. *poursuivant*, follower), the third and lowest order of heraldic officers. The office was instituted as a novitiate, or state of probation through which the offices of herald and king-at-arms were ordinarily to be attained, though it has been held that a herald or king-at-arms may be made *per saltum*. There are four pursuivants belonging to the English College of Arms: *Rouge Croix*, the oldest, so named from the Cross of St. George; *Blue-mantle*, instituted either by Edward III. or Henry V., and named in allusion to the robes of the Order of the Garter, or perhaps to the color of the arms of France; *Rouge Dragon*, deriving his title from King Henry VII.'s dexter supporter, a red dragon, assumed in allusion to his descent from Cadwaladr; and *Portcullis*, named from a badge of the same monarch. There are three pursuivants in the heraldic establishment of Scotland, known by the names of *Bute*, *Carrick*, and *Unicorn*—titles which,

as well as those of the heralds, seem to have originated in the reign of James III. The Scottish pursuivants take precedence according to seniority in office.

In ancient times any great nobleman might institute his own pursuivant with his own hands and by his single authority. The Dukes of Norfolk had a pursuivant, called *Blanch-lyon*, from the white lion in their arms; the pursuivant of the Dukes of Northumberland was styled *Esperance*, from the Percy motto; and Richard Nevil, Earl of Salisbury, had a pursuivant called *Egle vert*. We even find Sir John Lisle, in 1442, making Thomas de Laney his pursuivant, by the title of *Blanch Sanglier*. The ancient costume of a pursuivant of the king was a surcoat, embroidered with the royal arms, and worn with one sleeve hanging down in front, and another behind. In 1576, Rouge Croix was severely censured for wearing his coat as a herald. In later times, however, a pursuivant's coat is worn exactly as a herald's, the latter officer being distinguished by the collar of SS.

PURURAVAS, a celebrated legendary king of ancient India. According to tradition, he was a son of the planet Budha, or Mercur, by Ilā—a name of the earth, a prince renowned for liberality, devotion, magnificence, truthfulness, and personal beauty; but still more so on account of his love for the Apsaras Urvas'ī. This heavenly nymph having incurred the imprecation of some gods, and therefore having been compelled to descend from heaven, saw P., and was seen by him. The king having, in consequence, fallen in love with Urvas'ī, she consented to return his affection, on the condition that he would never suffer two rams, which she loved as children, and always kept near her bedside, to be carried away from her, and also that he should never be seen by her undressed. To these terms the king gave his assent; but the Gandharvas, the choristers in Indra's heaven, and the husbands of the Apsaras, being jealous of P., instigated one of their tribe to carry away one of the rams during the night; and after he had accomplished their design, other Gandharvas came and stole the second ram. Upon this P., highly incensed, and trusting that the nymph would not see his person, as it was dark, rose in pursuit of the robbers. At that moment, however, the Gandharvas caused a flash of lightning to irradiate the scene, and Urvas'ī beheld the king undressed. The compact was violated, and Urvas'ī disappeared, while the Gandharvas, abandoning the rams, departed to the sky. P. recovered the animals, but could find Urvas'ī nowhere. Like one insane, the king now wandered over the world, until he saw her, at Kurukshetra, sporting with four other nymphs of heaven in a lake beautified with lotuses. Urvas'ī, however, told him to keep away from her until, at the end of the year, she should be delivered of the son with whom she was pregnant by him. He obeyed; and after Ayū was born, these annual interviews between P. and Urvas'ī were repeated, until she had born him five other sons—Dhīmat, Amāvasu, Vis'wāvasu, S'atayus, and S'rutayus. But the king, now longing for an uninterrupted re-union with his wife, Urvas'ī endeavored to propitiate the Gandharvas who had caused their separation.

Her efforts were successful; and they taught the king how to produce by attrition, from the wood of the fig-tree, a sacrificial fire, and how to divide it into the three fires required for sacrificial acts. By this means, they enabled him then to celebrate many sacrifices, and, by virtue of these, to be transferred to the sphere where Gandharvas and Apsaras dwell together. This legend is adverted to in the Vedas, and related with more or less detail in the *Mahabharata* and the *Puran's* (see, for instance, Wilson's *Vishnu Puran's*); it is likewise the subject of the celebrated drama of Kālidāsa, the *Vikramorvas'ī*, where, however, the incidents that, according to the *Puran's*, cause the separation of P. and Urvas'ī, are not mentioned by the poet, her disappearance being ascribed by him to a fit of jealousy, in which she trespassed on the proscribed bounds of a divine hermitage. It deserves notice, too, that, in the drama, Urvas'ī is transformed into a creeper, and discovered in that condition by P., when frantically roaming in search of her in the forest of Akalusha—a transformation pointing to some affinity between this latter myth and that of Daphne when pursued by Apollo.—The idea, however, on which the original Hindu myth is based—apart from the semi-historical and fantastical detail by which it was overgrown—seems to have been suggested by the (supposed) motion or wanderings (Purūravas, from *puru*, much, and *raśas*, going—from *ru*, go, move) of the sun (*Gandharva*), in the Vedas, also being a personification of the fire of the sun), attracting or absorbing, and thus uniting, as it were, with the vapors floating in the sky (*Apsaras*—from *ap*, water, and *saras*, going, arising, hence 'water-born'—being originally 'personifications of the vapors which are attracted by the sun, and form into mists or clouds'; see Goldstücker's *Sanskrit Dictionary*, under 'Apsaras'; and Urvas'ī, from *uru*, large, wide, and *as'*, pervade, hence 'the far-prevailing'—being identified in one passage of the *Mahabharata* with the river Ganges).

PURVEYORS, ARMY, were officers charged with superintending the civil affairs of army hospitals, as the payment of men, procuring provisions, medical comforts, bedding, &c. In 1868, the department was merged with others in the Control Department; and on the abolition of the latter in 1875, its functions passed to the Commissariat and Transport Department.

PUS is a well-known product of inflammation, and occurs as a thick yellow creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar odor, usually an alkaline reaction, and a specific gravity of about 1.032. Like the blood, it consists of certain definite microscopic elements, and of an intercellular fluid or serum in which they swim.

The microscopic elements are: 1. The pus-corpuscles, which, both in their microscopical and chemical relations, seem to be identical with the lymph-corpuscles, or colorless blood-cells; in diameter, they range from 0.004 to 0.005 of a line, and each corpuscle consists of a cell-wall, which often appears granular, of viscid transparent contents, and of a nucleus which is adherent to the cell-wall, and which can be rendered much more apparent by the addition of acetic acid. 2. Molecular granules, and 3. Fat-globules. The serum of pus is perfectly clear, of a slightly yellow color, and coagulates on heating into a thick white mass.

The chemical constituents of P. are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180); fats (from 9 to 25); extractive matter (from 19 to 29); and inorganic salts (from 6 to 13); in addition to which, mucin, pyrin, glycine, urea, &c., are occasionally present. Of the inorganic or mineral constituents, the soluble salts are to the insoluble in the ratio of 8 to 1, and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. The mode of formation of pus is described in the article SUPPURATION.

PUSEY, REV. EDWARD BOUVERIE, D.D., Regius Professor of Hebrew at Oxford, and Canon of Christ-church, a celebrated English divine, and one of the chief promoters of the High Church movement in the Church of England. He is the second son of the Honorable Philip Bouverie (younger brother of the first Earl of Radnor, who assumed the name of P.), by Lady Lucy Sherard eldest daughter of Robert, fourth Earl of Harborough. He was born in the year 1800, was educated at Eaton, and thence proceeded to Christ-church, where he obtained a first class in Classics in 1822, and gained the university prize for a Latin Essay in 1824. He was afterwards elected Fellow of Oriel; and in 1828, succeeded Dr. Nicoll in the Regius Professorship of Hebrew, to which a canonry at Christ-church is annexed.

Dr. P.'s first publication was on the *State of Religion in Germany*, the result of a visit to that country, which appears to have greatly influenced his subsequent course, and led him to devote himself to resist the progress of Rationalism. In 1835, he became a contributor to the *Tracts for the Times* (in union with Messrs. J. H. Newman, Keble, Williams, &c.), of which Nos. 67, 69, *On Holy Baptism*, and Nos. 18 and 66, *On the Benefit of Fasting*, were written by him (see TRACTARIANISM). He was also one of the editors of the *Library of the Fathers*, and of the *Library of Anglo-Catholic Theology*. In consequence of a sermon on *The Holy Eucharist, a Comfort to the Penitent*, preached before the university in 1843, he was suspended from preaching by the Vice-chancellor for three years, on the allegation that his language on the subject of the Real Presence was beyond what is sanctioned by the Formularies of the Church of England. Dr. P., however, protested against the proceeding, and appealed to the teaching of English divines.

His other principal works are: *Remarks on the Benefits of Cathedral Institutions*; two treatises on the *Royal Supremacy in Spiritual Matters*; a treatise on the *Ancient Doctrine of the Real Presence*; *Letters to the Archbishop of Canterbury*, the (late) Bishop of Oxford, and the (late) Bishop of London, in Defence of Church Principles; *On Marriage with a Deceased Wife's Sister*; *On the Use of Private Confession in the English Church*; Translations of several foreign devotional works adapted to the use of the English Church; *History of the Councils of the Church*; a *Commentary on the Minor Prophets*; *Lectures on the Prophet Daniel*; a *Catalogue of Arabic MSS. in the Bodleian Library*; and numerous sermons. P. was for more than half a century one of the chief powers in the church of England and in English religious life, being regarded by some as a reformer, and by others as the heresiarch. He died 16th Sept. 1882. Puseyism was long the more usual name for the Tractarian movement (see TRACTARIANISM), and Puseyite was used even by Ritualists (see RITUALISM), though P. had little personal sympathy with this outcome of the Tractarian tendency.

PUSHKIN, ALEXANDER SERGEJEVITCH, a Russian poet of good family, was born at Moscow, 26th May 1799, and educated at the imperial lyceum of Tsarskoe Selo, where he acquired more reputation for his liberal opinions than for his attention to study. In 1817, he entered the service of government, and soon became

one of the most prominent figures in fashionable society. In 1820, he published a popular romantic poem, *Ruslan and Liudmila*. Next came his *Prisoner of the Caucasus*, 1822; and his *Fountain of Bakhchiserai* (1824); *Trigani* (The Gypsies, 1827); and *Eugeni Onegin* (1828, Eng. transl. 1881), a humorously sarcastic description of Russian society—after the fashion of Byron's *Beppo*. In 1829, he published *Poltava*, which has Mazeppa for its hero. About the same time, he wrote a dramatic poem entitled *Boris Godunov*, one of the best of all his works; but subsequent to this he appears to have addicted himself almost wholly to prose; and from being or seeming an enthusiastic 'liberal,' he passed—after his appointment to the office of imperial historiographer, with a pension of 6000 rubles—to the extreme of Russian conservatism. He was mortally wounded in a duel, and expired at St. Petersburg, January 29 (February 10), 1837. P. is reckoned the finest poet that Russia has produced in the present century. His countrymen call him the 'Russian Byron,' and he has not a little of the bold and brilliant genius of his prototype, excelling like him in vigor of imagery and impassioned sentiment.

PUSTULAR DISEASES. Under this head are included the cutaneous diseases which are characterized by *pustules*, or circumscribed elevations of the cuticle, containing pus; they are Ecthyma, Impetigo, Acne, and Syccosis, all of which are noticed in special articles. Pustules also occur in small-pox, and occasionally in chicken-pox, but these are on good grounds regarded as febrile diseases, in which the eruption on the skin is not the primary disorder. Boils (q. v.), although not included under the head of 'pustular diseases,' are in their nature pustular.

PUSTULE, MALIGNANT. See MALIGNANT PUSTULE.

PU'TCHUK, an aromatic root, a considerable article of commerce in India, where it is used both as a perfume and as a medicine, and of export to China, where it is much used for incense, as it gives out a very pleasant odor when burned. It appears to be the *Cosrus* (q. v.) of the ancients.

PUTEAUX, a town of France, in the dep. of Seine, at a distance of about two miles from the western boundary of Paris. It is situated on the left bank of the Seine, opposite to the Bois de Boulogne. The situation of P. is a very pleasant one, and many Parisians have fine villas here. The population and industrial activity of the place have of late greatly increased. Pop. (1876) 11,887.

PUT'TLOGS, small timbers used in the construction of buildings. They lie between the wall and the poles of the scaffolding, and on them the floor of the scaffolding rests. Apertures called 'putlog-holes' are common in buildings of all ages.

PUTREFACTION is the term applied to the decomposition of organic substances, when such decomposition is accompanied by an offensive odor. In other respects it is identical with Fermentation (q. v.). In the process of putrefaction the organic compounds break up, producing others of lower order, inorganic compounds, and even simple elements. It may be prevented by exclusion of oxygen and moisture, by maintaining a freezing or boiling temperature, by the use of antiseptic substances, &c.

Putrefaction was long believed to be *spontaneous*—i. e., to depend upon the supposed peculiar instability of organic matter and its affinity for oxygen. In all cases, however, certain organic ferments, the schizomycete fungi known as Bacteria (q. v.)—excessively minute, non-nucleated rods or spheres of protoplasm, inclosed in a cellulose envelope, and multiplying rapidly by transverse division—are found in enormous quantity. That their presence is not merely a concomitant, but the exclusive cause of the putrefactive process, is readily demonstrated by experiment. If we take an extremely putrescible fluid, such as infusion of fish or hay, and cork it up, it soon becomes turbid with bacteria, and acquires a characteristic odor; but if plugged with cotton wool, and boiled for a few minutes, so as to kill the bacteria and their germs present in the flask and its stopper, it may then be put aside for any number of years without a symptom of putrefaction; but if the plug be then removed, even for a second or two, in the air of an ordinary room and then replaced, germs enter, develop, and multiply, and decomposition immediately sets in. This explains how the minutest taint of decomposing matter is able to set up putrefaction on the largest scale; since it contains living bacteria, which multiply with incredible rapidity, at the expense of the organic matter which they decompose. If the protoplasm of the bacteria be coagulated by heat, or poisoned by the application of anti-septics, no such inoculation can be effected, hence the putrefactive power is restricted to the living ferment, and does not exist in the products of its life. Hence the paradox, 'putrefaction is not the result of death, but of life.'

We are still far from fully understanding the chemistry of the putrefactive disintegration of organic compounds. Probably the bacteria act, in the first place, by removing oxygen and by causing the assimilation of water.

Numerous forms and varieties of bacteria exist in nature, and

each doubtless differs in its physiological activities. Many are known to enter the blood, causing definite diseases, splenic fever, phthisis, &c., while others poison wounds. The practice of medicine, and still more of surgery, has of late years been revolutionized through this knowledge, as well as has the art of brewing; and our notions of hygiene, as well as of domestic and civic cleanliness, are consequently in process of rapid change. See ANTISEPTICS, GERM THEORY, &c.

PUTTEEALA (Patidla), a native state in the Punjab, partly in the plain south of the Sutlej, partly amongst the hills near Simla. Pop. 1,586,000. P., the capital, is a walled town.

PUTRID FEVER. See JAIL FEVER.

PUTTING TO SILENCE, in the Law of Scotland, is the title of a suit or action of declarator, the object of which is to put an end to certain pretended claims of marriage. The suit corresponds to what is called in England a suit of Jactitation (q. v.).

PUTTUN, PAITAN, or ANHULWAR PATTAN, a town of India, in the territory of the Guicowar, Guzerat, 64 miles north-west from Allahabad. It stands on the Saraswati, a small river, which is a tributary of the Banas; and is a town of considerable importance, having manufactures of swords, spears, pottery of a light fine kind, and silk and cotton goods. P. occupies part of the site of the ancient city of Anhwara, the traces of the walls of which may still be seen, extending to about five miles in circuit. Pop. estimated at 30,000.

PUTTY a composition of *whiting* and *drying* oil worked into a thick paste. It is used by painters and glaziers—by the former for filling up holes in surfaces, previous to their being painted with oil-colors; and by the latter, for fixing panes of glass in windows, &c. It becomes remarkably hard in time, and fixes the glass immovably.

PUTTY-POWDER, a material, consisting of peroxide of tin, in great use for polishing stone and metal work. It is also used as a coloring material for white glass, and for the white enamels of porcelain, &c. It is made by melting tin; as the surface oxidizes, the scum, which is the peroxide, is raked off and when cold, is reduced to a fine powder, which is white in color, and the particles are extremely hard.

PUY is the name commonly given in the highlands of Auvergne and the Cevennes to the truncated conical peaks of extinct volcanoes.

PUY, LE, or LE PUY-EN-VELAY, a town of France, department of Haute-Loire, about 70 miles south-west of Lyon, is one of the most picturesque towns in Europe. It stands on the steep southern slopes of Mount Anis, from the summit of which starts up precipitously the huge basaltic mass called *Rocher de Corneille*, crowned by a colossal figure of the Virgin, made of captured Russian cannon. The most notable buildings of Le P. are the cathedral, a splendid but heavy-looking structure of the 10th or 11th c., situated in the highest part of the town, and chiefly remarkable for a wonder-working image of the Virgin (*Notre Dame du Puy*). Lace, bells, silk, and wool are manufactured. Pop. (1876) 19,010.

PUY-DE-DOME, a large central department of France, containing an area of 3070 sq. m., and a population (1881) of 566,064. Plateau and mountain occupy three-fourths of it; plain and valley the rest. Branches of the Cevennes and of the Auvergne mountains overspread the east and west of the department. The multitude of conical hills or puy, of basaltic and lava masses, and of craters, shows the volcanic nature of the soil. See AUVERGNE. The famous volcanic group of the Puy-de-Dome, west of Clermont, has two main peaks, the highest 4617 feet. Mont Dore is the chief summit of a southern group of mountains, and is 5835 feet high. The principal river is the Allier, a tributary of the Loire. The soil is, in general, light and poor; but its volcanic character fosters vegetation; and the splendid valley of Limagne is fertile throughout. The climate is uncertain, and severe in the mountains. The principal minerals are iron, antimony, and lead. Hot and cold mineral springs are abundant; among the most frequented are those of St. Myon and Chateaudon. The department is subdivided into the arrondissements of Ambert, Clermont, Issoire, Riom, and Thiers.

PUZZOLA'NA, or POZZOLANA, a mineral substance, produced by volcanoes, and abundant in volcanic countries, is named from Pozzuoli, near Naples. It is earthy in character, with particles in a very loose state of aggregation, but is chemically like Basalt (q. v.). It is found of various colors—brown, yellow, reddish, and gray. See CEMENTS.

PWLHELI, a brisk little seaport and popular watering-place in Caernarvon. Pop. (1871) 3009.

PYÆ'MIA (from the Gr. *pyon*, pus, and *hæma*, blood), or purulent infection of the blood, is a disease whose exciting cause is the introduction of decomposing pus and wound discharges into

the circulation, through an ulcer or a wound, or an imperfectly closed vein (see *PELEBITIS* and *PUERPERAL FEVER*). The term *Septicæmia* is applied by some to the same disease, by others only to very grave cases of P., while by many it is restricted to cases of blood-poisoning by putrid animal matters in general, such as those obtained from decomposing hides or dead bodies, or borne on foul air or septic gases. The two conditions have a general resemblance to each other. The poison is rapidly absorbed and diffused, and the blood undergoes certain changes, the nature of which chemistry has as yet failed to detect; it is certain, however, that the blood contains micro-organisms (micrococci and bacteria; see *GERM THEORY*). Within twenty-four hours, in very acute cases, there are severe shiverings, headache, and giddiness, followed by heat, perspiration, and accelerated circulation. In twenty-four hours more, the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases, the symptoms closely resemble those of typhoid fever, and in this form, the disease is a common cause of death, after surgical operations; such cases are invariably characterized by the formation of secondary abscesses in the lungs, liver, kidneys, and other internal organs, in the various glands (the parotid gland, in President Garfield's case), in the joints, and the tissues immediately under the skin. The pus of such abscesses always contains bacteria. There is usually more or less delirium. The patient usually dies of exhaustion. Recovery is rare. It is chiefly, however, in the presence of *predisposing causes*, such as previous illness, prostration from organic disease or surgical complaints, or from difficult parturition, unhealthy occupations, &c., that the poison acts so severely; these, with the occurrence of putrefaction in a wound, may convert a comparatively slight local mischief into infection of the whole mass of the blood.

Bearing in mind the manner in which P. originates, it is clear that this disease is one to be prevented rather than cured. Until comparatively recently, when it was acknowledged that P. was the cause of death in 10 per cent. of all cases of amputation, and of 43 per cent. of all fatal primary amputations, the careful preparation of a patient before operation was, with justice, most strenuously insisted on. 'Patients must be strengthened,' said Mr. Callender, 'by tonics, such as quinine and iron; and their secretions must be set right by appropriate alteratives; this treatment must be continued for a considerable period.' Diet should be attended to, and intemperate patients 'should be accustomed to a more healthy mode of life.' After operation, also, patients should be adequately supported with nutritious diet, and stimulants and opium if necessary. No judicious surgeon will ever neglect such measures. But the really essential matter in the prevention of P. is the prevention of putrefaction in the wound discharges. This has been clearly proved by the brilliant results achieved by Mr. Lister and other surgeons at home and abroad, who have adopted the antiseptic method of treating wounds (see *ANTISEPTICS*; *CARBOLIC ACID*). For several years Mr. Lister's wards in Glasgow Royal Infirmary, formerly ravaged by P., remained free of the disease after the adoption of the antiseptic system; Prof Létiévant, of Lyons, states that, as a result of two years' practice of this mode of treatment, purulent infection had *disappeared from his wards*, where it formerly had a permanent home; and similar testimony might be quoted from every quarter and to any extent. The use of antiseptics, then, adopted early and followed out intelligently, may be said to have abolished absolutely the risk of purulent infection in wounds from operation or injury.

Even when the disease has shown itself, the use of antiseptics (carbolic acid, boracic acid, boro-glyceride, iodoform, thymol, eucalyptol, &c.) should be resorted to locally. The bowels, skin, and kidneys may be acted on by suitable purgatives, diaphoretics, and diuretics, with a view to the elimination of the poison; but the patient must be carefully watched for signs of depression, which must be combated with opium and stimulants, both of which should be given in small and frequently-repeated doses. Various drugs having antiseptic properties have also been recommended for internal use; salicylic acid and the salicylates, the hyposulphite of soda, and the hyposulphites generally, may be mentioned. This mode of treatment, combined with the most assiduous nursing and generous dieting, and the appropriate surgical management of such secondary abscesses as form, will sometimes prove successful.

PYAT, FELIX, a French journalist and communist, born 4th Oct. 1810. He studied law, was admitted to the bar, but chiefly wrote articles, feuilletons and plays, often with strong political allusions. In 1848, he was a socialist secretary of the constituent assembly. He escaped to Switzerland and Belgium, and was a member of the 'European revolutionary committee,' returning to France in 1869. In 1870, he was condemned to five years' imprisonment, but had already escaped. In 1870, he became a leader of the Paris communists, and on the fall of the Commune escaped to London. He was tried and condemned to death,

in absence, for his share in the misdeeds of the Communal Government.

PYCNOGONIDÆ, a very remarkable family of *Crustacea*, of the section *Edentata* of Milne-Edwards, and forming the order *Araneiformes* (Spider-like) of some authors. By Cuvier and many other naturalists, a place was assigned them among *Arachnida*; and it is only of late that they have been decidedly referred to *Crustacea*, in consequence of the discovery that they undergo metamorphoses. They are all marine, and some of them live among algae, or are to be found under stones on the beach, whilst others are dredged from deep water. They seem to prey by suction on molluscs, but probably on many kinds of marine animals. The legs of many, as in the genus *Pycnogonum*, are furnished with hooks for taking hold, and Linnæus believed *P. littorale* to be parasitic on whales; but it is not uncommon among sea-weeds on the British coasts. The suctorial proboscis of these creatures may be said to form the whole head. The abdomen is almost rudimentary. Their most remarkable characteristic is in their digestive cavity. The stomach gives off from its circumference ten long cæca, four of which on each side extend into the proper or locomotive legs, the other two into the pincer-like rudimentary foot-jaws. These ramifications of the alimentary canal seem to serve all the purposes of the circulatory, respiratory, and chyloferous systems of higher animals. Hock, in the *Challenger Reports*, and Dohrn, in *Fauna u. Flora d. Golfes v. Neapel*, have thoroughly reinvestigated the structure and development of this remarkable group, and give systematic descriptions and figures of all the new and more important forms. For summary, see Huxley's *Comp. Anat. Invertebr. Anim.*, and Balfour's *Embryology*, vol. i.

PYCNOSTYLE. See *INTERCOLUMNIATION*.

PYGMIES (Gr. *pygme*, a measure—from the elbow to the hand), a fabulous race of dwarfs in whose existence the ancients believed. Homer says that every spring they were attacked by the cranes on the coast of Oceanus. Later writers place them at the mouths of the Nile, but we also read of northern Pygmies inhabiting the region of Thule, and of Pygmies who lived in subterranean dwellings on the eastern side of the Ganges. Greek fancy worked hard to paint the Lilliputian dimensions of these creatures. It was said that they cut down every corn-ear with an axe; that when Hercules came into their country, they climbed up his goblet, by the help of ladders, to drink from it; and that, when he was asleep, two whole Pygmy armies fell upon his right, and another on his left, hand, but were all rolled up by the hero in his lion's skin. Aristotle did not believe that the stories about Pygmies were utterly fabulous, however much they had been overlaid by fancy with the marvelous. His 'rationalistic' (if not rational) interpretation was, that they were probably some diminutive tribe in Upper Egypt, who rode very small horses, and lived in caves. A race of very small men was encountered by Schweinfurth in his travels in the heart of Africa (1868—1871).

PYGMIES OF WESTERN AFRICA. The existence of pygmy races of human beings in Africa has been often asserted, and many circumstances less easily credible than their diminutive size have been reported. See *PYGMIES*. Du Chaillu some time ago discovered the actual existence of a pygmy race, but of whom the diminutive size is the only remarkable characteristic. He found them in the mountainous country on the east of the southern great branch of the Ogobal. They are called Obongos, are about 4½ feet in height, and live in the midst of negro tribes of ordinary stature. They subsist chiefly on animal food, but partly also on the roots, berries, and nuts which they find in the forests. Schweinfurth, in his travels in the heart of Africa, 1868—1871, also came into contact with a nation of pygmies.

PYM, JOHN, famous as the leader of the popular party in the House of Commons in the reign of Charles I., was born in 1584. He came of a good family in Somersetshire, and had considerable property in that county. He was for some years a gentleman commoner of Pembroke College, Oxford, and afterwards studied law at one of the Inns of Court. Having been sent to parliament as a member for Tavistock, in Devonshire, he attached himself to the popular party; and, during the later part of the reign of James I., became noted for his vigorous opposition to the arbitrary measures of the court. In 1626, the year after the accession of Charles I., he distinguished himself by taking a prominent part in the impeachment of the king's favorite, the Duke of Buckingham. In 1640, the functions of parliament having been in abeyance for 13 years, during which time the popular discontent had gradually been growing to a head, the celebrated Long Parliament was convened; and from the first, P. was by common consent recognized in it as the leader of the opposition to the despotic policy of the monarch. For the position which he thus occupied, his qualifications were eminent. In temper, he was bold and fearless; he was master of an eloquence, close, terse, and vigorous; and in knowledge of parliamentary form and business procedure, it was considered he had scarcely his equal in the House. On

November 3, as soon as business had opened, he set forth to the House, in a long and elaborate address, the intolerable grievances under which the nation labored; and a week after, he boldly denounced the Earl of Strafford as the 'great promoter of tyranny,' to whose evil influence on the mind of the king these grievances were in the main to be attributed. In the impeachment of Strafford which followed, resulting in his execution under a bill of attainder passed upon him, Pym took the leading part. Of this master-stroke of policy, which deprived the king of the one man of resolute temper and powerful genius who adhered to his cause, the credit must be chiefly awarded to Pym. In the subsequent proceedings against Laud, he was also conspicuous, as in every other crisis of moment, up to the time when war became inevitable between the king and the parliament. On the breaking out of hostilities, he remained at his post in London, and in the exercise of the functions of the executive there, rendered services to the cause not less valuable and essential than those of a general in the field. While the strife was yet pending, he died somewhat suddenly at Derby House, on December 8, 1643, having been appointed to the important post of Lieutenant of the Ordnance only the month previous. He was buried at Westminster Abbey with great pomp on the 13th; and was borne to his last resting-place by six members of the House of Commons. The House of Commons also voted £10,000 in payment of his debts.

PYNE, LOUISA, a popular English singer, daughter of a well-known singer, Mr. G. Pyne, was born in 1824, received instruction from Sir George Smart, and first appeared in public in London in 1842. She appeared in Paris in 1847, made her *début* in opera in 1849, and has since visited America. She is chiefly known from her being chief soprano of an English opera company, in which she was associated with Mr. Harrison at the Lyceum, Drury Lane, and Covent Garden.

PYRACA'NTHA. See CRATÆGUS.

PYRAMID, in Geometry, is a solid figure, of which the base is a plane rectilinear figure, and the sides are triangles, converging to a point at the top or 'apex.' Pyramids, like prisms, are named from the form of their bases; thus, a pyramid having a triangle for its base is a triangular pyramid, with a square base, a square pyramid, with any four-sided figure for its base, a quadrangular pyramid; or it may be pentagonal, hexagonal, &c. Pyramids may be either 'right' or 'oblique.' See PRISM. A right pyramid, with an equilateral figure for its base, has all its sloping edges equal; but this is not the case if the pyramid be oblique. The most remarkable property of the pyramid is, that its volume is exactly one-third of that of a prism having the same base and vertical height; and it follows from this, that all pyramids having the same base and height are equal to each other.

PYRAMID, a structure of the shape of the geometric figure so called, erected in different parts of the Old and New World, the most important being the Pyramids of Egypt and Mexico. Those of Egypt were considered one of the seven wonders of the world, are seventy in number, of different sizes, are between 29° and 30° N. lat., and are masses of stone or brick, with square bases, and triangular sides.

Although various opinions have prevailed as to their use, as that they were erected for astronomical purposes, for resisting the encroachment of the sand of the desert, for granaries, reservoirs, or sepulchres, the last mentioned hypothesis has been proved to be correct in recent times by the excavations of the late General Howard Vyse, who is said to have expended nearly £10,000 in investigating their object and structure. They were all the tombs of monarchs of Egypt who flourished from the fourth to the twelfth dynasty, none having been constructed later than that time; the subsequent kings being buried at Abydos, Thebes, and other places, in tombs of a very different construction. The meaning of the word pyramid is involved in great obscurity; although attempts have been made to derive it from the Coptic *pyram*, yet, as in the hieroglyphs, it is found in connection with the words *ben ben* or *ber ber*, forms of the Coptic *beebe mahou*, or tomb, and *abmeir*, or sepulchre, it is probably an ancient Greek word. The pyramids are solid mounds raised over the sepulchral chambers of the kings, the first act of an Egyptian monarch being to prepare his future 'eternal abode.' For this purpose, a shaft of the size of the intended sarcophagus was first hollowed in the rock at a suitable incline to lower it, and at a convenient depth a rectangular chamber was excavated in the solid rock. Over this chamber, a cubical mass of masonry, of square blocks, was then placed, leaving the orifice of the shaft open. Additions continued to be made to this cubical mass both in height and breadth as long as the monarch lived, so that at his death all that remained to be done was to face or smooth the exterior of the step-formed mound. But in some cases, the masonry passed beyond the orifice of the shaft, which involved the construction of a new shaft, having its orifice beyond it.

The Pyramid was faced by adding courses of long blocks on each layer of the steps, and then cutting the whole to a flat or

even surface, commencing from the summit. The outer masonry, however, or casing, as it is called, has in most instances been partially stripped off. Provision was made for protecting the vertical joints by placing each stone half way over another. The masonry is admirably finished; and the mechanical means by which such immense masses of stone were raised to their places has long been a mystery; the discovery, however, of large circular holes in some of the stones has led to the conclusion that they were wound up by machines. The stones were quarried on the spot; sometimes, however, granite taken from the quarries of Syene was partially employed. The entrances were carefully filled up, and the passage protected by stone portcullises and other contrivances, to prevent ingress to the sepulchral chamber. There appears to have been also a door or pylon at the entrance

Supposed Mode of Construction of Pyramids:
(From Gliddon's *Egyptian Archaeology*).

of the shaft, ornamented with Egyptian sculptures and hieroglyphs. The sides of the pyramids face the cardinal points, and the entrances face the north. The work of the larger Pyramids was executed by *corvées* of laborers. The most remarkable and finest Pyramids are those of Gizeh, situated on a level space of the Libyan chain at Memphis, on the west bank of the Nile. The three largest are the most famous.

The first or Great Pyramid, as appears from the excavations of Vyse, was the sepulchre of the Cheops of Herodotus, the Chembes, or Chemmis, of Diodorus, and the Suphis of Manetho and Eratosthenes. Its height was 480 feet 9 inches, and its base 764 feet square; in other words, it was higher than St. Paul's Cathedral, on an area the size of Lincoln's Inn Fields. Its slope or angle was 51° 50'. It has been, however, much spoiled and stripped of its exterior blocks for the building of Cairo. The original sepulchral chamber, called the Subterranean Apartment, 46 feet X 27 feet, and 11 feet 6 inches high, has been hewn in the solid rock, and was reached by the original passage of 320 feet long, which descended to it by an entrance at the foot of the Pyramid. The excavations in this direction were subsequently abandoned, on account of the vast size attained by the Pyramid, which rendered it impracticable to carry on the entrance on a level with the natural rock, which had been cut down and faced for that purpose. Accordingly, a second chamber, with a triangular roof, was constructed in the masonry of the pyramid, 17 feet X 18 feet 9 inches, and 20 feet 3 inches high. This was reached by a passage rising at an inclination of 26° 18', terminating in a horizontal passage. It is called the Queen's Chamber, and occupies a position nearly in the center of the Pyramid. The monument—probably owing to the long life attained by the monarch—still progressing, a third chamber, called the King's, was finally constructed, by prolonging the ascending passage of the Queen's Chamber for 150 feet further into the very center of the Pyramid, and after a short horizontal passage, making a room 17 feet 1 inch X 34 feet 3 inches, and 19 feet 1 inch high. To diminish, however, the pressure of the superincumbent masonry on the flat roof, five small chambers were made vertically in succession above the roof, the last one pointed, varying in height from 1 foot 4 inches to 8 feet 7 inches, the apex of the top one being rather more than 69 feet above the roof of the King's Chamber. The end of the horizontal passage was finished in a superior style, and cased with red syenitic granite; and in the King's Chamber was the granite sarcophagus of the king Cheops, 7 feet 64 inches long, 3 feet 3 inches broad, and 3 feet 5 inches high, for whom the Pyramid was built.*

As the heat of this chamber was stifling, owing to want of ventilation, two small air channels, or chimneys, about nine inches * Piazzi Smyth thinks that this coffer was not a sarcophagus, but a standard measure of capacity, of which the British quarter is the fourth part. *Our Inheritance in the Great Pyramids*, 1884. Proctor (in *The Great Pyramids*, 1882) holds that the pyramid was primarily an astrological observatory, and only secondarily a tomb. Without doubt it is carefully oriented, and most of its constructive details manifestly bear relation to astronomical facts.

square, were made, ascending to the north and south sides of the Pyramid. They perfectly ventilate this chamber. After the mummy was deposited in the King's Chamber, the entrance was closed with granite portcullises, and a well made at the junction of the upward-inclined and horizontal passages, by which the workmen descended into the downward-inclined passage. Subsequently there arose various traditions, even in the days of Herodotus, Cheops being reported to lie buried in a chamber surrounded by the waters of the Nile. It took a long time for its construction—100,000 men being employed on it for thirty years, or more

apartment.

probably for above half a century, the duration of the reign of Cheops, which is dated by different chronologists at 3229, 3095, or 2123 B.C. The operations in this Pyramid by General Vyse gave rise to the discovery of marks scrawled in red ochre in a kind of cursive hieroglyphs on the blocks brought from the quarries of Tourah. These contained the name and titles of Khufu (the hieroglyphic form of Cheops); numerals and directions for the position of materials; with them were masonic marks.

The second Pyramid is situated on a higher elevation than the first, and was built by Suphis II., or Kephren, who reigned 66 years, according to Manetho, and appears to have attained a great age. It has two sepulchral chambers, and appears to have been broken into by the Calif Alaziz Othman Ben-Yousouf, 1196 A.D. Subsequently, it was opened by Belzoni. The masonry is inferior to the first, but it was anciently cased below with red granite.

The third Pyramid, built by Menkara, or Mycerinus, who reigned sixty-three years, is much smaller than the other two, being only 218 feet high by 354 feet 6 inches square. It has also two sepulchral chambers, both in the solid rock. The lower sepulchral chamber, which held a sarcophagus of rectangular shape, of whinstone, had a pointed roof cut like an arch inside; but the cedar coffin, in shape of a mummy, had been removed to the upper or large apartment, and its contents there rifled. Amongst the debris of the coffin and in the chambers were found the legs and part of the trunk of a body with linen wrapper, supposed by some to be that of the monarch, but by others to be that of an Arab, on account of the ankylosed right knee. This body and fragments of the coffin were removed to the British Museum; but the stone sarcophagus was unfortunately lost off Carthage, by the sinking of the vessel in which it was being transported to England. The masonry of this Pyramid is most excellent, and it was anciently cased half-way up with black granite.

There are six other Pyramids of inferior size and interest at Gizeh; one at Abou Rouash, five miles to the north-west of the same spot, is ruined, but of large dimensions; another Zowyet El Arrian, also made of limestone, is still more ruined; another at Reegah, a spot in the vicinity of Abooseer, also much ruined, and built for the monarch User-en-Ra, by some supposed to be Busiris. There are five of these monuments at Abooseer, one with a name supposed to be that of a monarch of the third dynasty; and another with that of the king Sahura.

A group of eleven Pyramids remains at Sakkarra; the exploration of some of these in 1881 by M. Maspero gave some very interesting results. Five other Pyramids are at Dashour, the northernmost of which is supposed to be that of the king Asychis of Herodotus, and has a name of a king apparently about the twelfth dynasty. Others are at Meydoon and Illahoon; and two at Biahmo, at Medinat El Fyoun, apparently the sepulchres of the

last kings of the twelfth dynasty. Some small brick Pyramids of the kings of the eleventh dynasty are at the Drah Aboo Negger at Thebes. In Nubia, the ancient Æthiopia, are several Pyramids, the tombs of the monarchs of Merod, and of some of the Ethiopian conquerors of Egypt. They are taller in proportion to their base than the Egyptian Pyramids, and generally have a sepulchral hall, or propylon, with sculptures, which faces the east. The principal groups of these Pyramids are at Bege Raule, or Begromi, 17° N. lat., in one of which, gold rings and other objects of late art, resembling that of the Ptolemaic period, were found.

In Assyria, the Birs Nimrud, or Tower of Belus, was a kind of step-shaped Pyramid of seven different-colored bricks, dedicated to the planets by Nebuchadnezzar. The Mujellibe, another mound, was of pyramidal shape. The Pyramid also entered into the architecture of the tomb of Sardanapalus at Tanus, and of the Mausoleum of Artemisia at Halicarnassus. A small Pyramid, the sepulchre of C. Cestius, imitated from the Egyptian in the days of Augustus, still exists within the wall of Aurelian at Rome. Temples and other monuments of pyramidal shape are found in India, China, Java, the Polynesian Islands, and elsewhere. The Toltecs and Aztecs erected temples in Mexico, called *Teocalli*, or abodes of gods, of pyramidal shape, with steps or terraces by which to ascend and reach an altar, generally placed on the summit, where they performed human sacrifices and other rites. These, however, are not true Pyramids, the pure and simple form of which is restricted to Egypt.

The Pyramid entered extensively into the architecture of the Egyptians, and appears on the tops of Obelisks and tombs as a kind of roof. Small models of Pyramids, with inscribed adorations to the sun, or having royal names, were also placed in the Tombs.—Lepsius, *Ueber den Bau der Pyramiden*, 1843; *Briefe* pp. 143, 217; Wilkinson, *Topogr. of Thebes* (Lond. 1835); Vyse, *Operations carried on at Gizeh* in 1837 (1842); Gliddon, *On Ægyptiaca* (1849); Piazz Smyth, *Life and Work at the Great Pyramid* (1867).

PYRAMUS AND THYSBE. The tragical history of these two lovers is told by Ovid in the 4th book of his *Metamorphoses*. They were natives of Babylon, and tenderly attached to each other, but as their parents would not hear of their marriage, they had to content themselves with clandestine interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting-spot, was startled to discover a lioness. She immediately ran off, but in her terror and haste, dropped her garment, which the fierce animal, that had just torn an ox in pieces, covered with blood. Soon after, Pyramus appeared, and seeing his mistress's robe, came to the conclusion that she had been murdered, whereupon he killed himself. Thisbe now returned, and beholding her lover lying dead on the ground, put an end to her own life. The story was a favorite one during the middle ages, when a couple, unhappy in their love, were termed a *Pyramus and Thisbe*. Shakspeare, in his *Midsummer Night's Dream*, has introduced it—but in a way that has the effect of caricature.

PYRENEES, the name of that mountain-range which, separating France from Spain, extends 270 miles in length, and from 30 to 70 miles in breadth, from the Gulf of Rosas, in the Mediterranean, to the south-east corner of the Bay of Biscay. This mountain-system, covering an area estimated at 12,600 sq. m., consists of two great chains, one of which runs east from the Bidassoa to the west bank of the Noguera Pallaresa; and the other originating in the Pic du Midi d'Ossau (9510 feet). lat. about 0° 25' W., a little to the north of the former, extends eastward, and, after being intersected at the Val d'Arnan by the Garonne and many smaller streams, reaches the Mediterranean, on the shores of which, immediately north of the Gulf of Rosas, it terminates in the promontories of Norfeo and Creuz. The northern slopes of these mountains to the plains and undulating districts of the south-west of France, are of gradual descent; while the southern slopes descend to the mountainous regions of Northern Spain by steep terraces. That portion of this mountain-system in which the eastern part of the southern, and the western part of the northern chains run parallel to each other, is called the High or Middle P.—a district about 16 miles in length, and forming the wildest and most elevated portion of the whole system. In the south-west of the Middle P. is a series of lofty summits, beginning with the Pic du Midi de Pan (9544 feet), and ending with the barren Maladeta, whose highest point, the Pic de Nethou or Malahite (11,168 feet), is the highest summit in the system. Between these two summits, there are several upwards of 10,000 feet high, as Mont Perdu (10,994 feet). The north-eastern and less elevated portion of the Middle P. forms a rampart, frequently interrupted by transverse valleys, and of which the principal summits are the Pic de Gavilios (8170 feet) and the Pic du Midi de Barèges (9307 feet).

The Eastern P. rise in their highest summits into the region of perpetual snow, and as far as the sources of the Segre, form a mighty unbroken wall of rock. From this point, however, they assume a different character, decreasing in height, and being in-

intersected by valleys. The West P. nowhere reach the snow-line, as their highest summit, the Pic d'Anie, does not rise above 7500 feet. Forming at first ridges of from 6000 to 7000 feet, they decrease in height as they extend west, until, on the lower Bidassoa, they take the form of isolated masses about 3000 feet high. The average height of the P. is from 6000 to 7210 feet. At an almost equal elevation are most of the mountain-passes. These passes, called in some places *cols*, in others *ports* (Span. *puerto*), are about 100 in number, though only seven of them are practicable for wagons and cannon. The most important are the roads of St. Jean de Luz over the Bidassoa to Vittoria, St. Jean Pied du Port to Pampluna, and that from Perpignan over Junquera to Gerona. The P. comprise no extensive and long valleys. Generally, the valleys are small and caldron-shaped, and communicate by means of narrow passes. The rivers are inconsiderable. The region of perpetual snow, which on the northern slopes of the mountains, begins at the height of 8137 feet, and on the southern slopes at 8858 feet, comprises no extensive snow or ice tracts. Glaciers are few and small, and nowhere occur lower than 7800 feet. On the warm and dry southern slopes, no glaciers occur. Few forests exist, and the steep walls of rock, parched by the sun and mid-day winds, are either quite bare, or are covered with low brushwood and meagre pasture. The more gradually declining northern slopes, on which snow and springs are more abundant, show a richer vegetation, and are for the most part covered with lofty forests, and beautiful mountain pasture. Granite forms the kernel of the Pyrenean mountain-system, and is overlaid by chalk and sandstone masses. The P. are not rich in metals, but abound in mineral springs, of which the chief are those of Bagnères de Bigorre (q. v.) and Barèges.

PYRÉNÉES, BASSES, a department forming the south-west corner of France. Area, 2940 sq. m.; pop. (1881) 434,366. The department is divided into the five arrondissements of Pau, Oloron, Orthez, Bayonne, and Mauléon. Chief town Pau. The Basses-P. occupies the northern slopes of the Western Pyrenees, offshoots from which divide the department into a number of valleys, each traversed by a clear mountain stream, locally known as a *gave*. The chief of these are the Gave d'Oloron, Gave de Pau, the Bidouze, and Nivelle. The high valleys and slopes are generally fertile, and well adapted for the growth of the vine, chestnut, various other fruits, and maize, though not for wheat. The best wines are those of Jurançon and Gau, Pontac and Auberlin, Flax and hemp, rye, barley, oats, and millet are also grown; but the principal source of industry, after the making of wine, is the rearing of horses, cattle, sheep, and mules for the Spanish markets, and the raising of swine in the great beech-forests, together with the preparation of hams of excellent quality and high flavor. Marble, alabaster, slate, opite, copper, iron, sulphur, and cobalt, constitute the chief mineral products; but their importance as sources of wealth falls short of that of the numerous mineral springs, the most important of which are those of Biarritz, Cambo, Eaux-Bonnes and Eaux-Chaudes.

PYRÉNÉES, HAUTES, a department of France, lying east of the Basses-Pyrenees, is a part of the old province of Gascony. The Hautes-P., which, as its names implies, contains the loftiest summits of the Pyrenean chain, is divided into the three arrondissements of Tarbes, Argelès, and Bagnères, and the chief town is Tarbes. The aspect of the scenery is, moreover, very varied—savage mountains and precipitous rocks in the south, an agreeable diversification of hill with dale in the center, softening down to fertile plains in the north. The principal rivers, none of which, however, are navigable in the department, are the Adour and the Gave de Pau. The climate is generally mild in the plains and sheltered valleys, but even there, storms are of frequent occurrence. The well-cultivated and artificially watered low lands, yield good crops of cereals, leguminous plants, flax, fruits of every kind, including the grape, from which excellent wine and brandy are made. Horses, mules, cattle, sheep, swine, and poultry, are much reared. This department, which is the richest part of the Pyrenees in mineral products, especially marble of various kinds, copper, iron, zinc, lead, antimony, slate, granite, &c., contains also the most celebrated springs, as the sulphur springs at St. Sauveur, and the hot-baths of Bagnères, Barèges, and Cauterets. The very limited commercial industry of Hautes-P. embraces the manufacture of woollen and mixed fabrics, including bareges, coloring matters, leather, paper, cutlery, &c. There is also a smuggling trade with Spain. Area, 1742 sq. m.; pop. (1881) 236,474.

PYRÉNÉES-ORIENTALES, a maritime department of France, is bounded on the E. by the Mediterranean, and on the S. by the Pyrenees. Area, 1590 sq. m.; pop. (1881) 208,855. It is divided into the three arrondissements of Perpignan, Prades, and Céret. The chief town is Perpignan. Like the two previously described, this department presents a series of parallel valleys formed by spurs from the Pyrenees, but in this case the valleys run east and

west. They are three in number, and are watered by the Gly, Tet (the principal river), and Techs. The south-west corner is drained by the Segre (Segura), a tributary of the Ebro. An extended plain occupies all the north and east of the department. The climate is good, and in the plains is seldom disturbed by great extremes of heat or cold. The vegetable products include fine grain and some of the choicest fruits of this latitude. Wines constitute the wealth of the district, and include the red wines of Roussillon, the white muscatel of Rivesaltes, and other approved kinds. The chief exports are wine, cocoons, the surplus live stock and its products, sardines, anchovies, &c. The mineral wealth of the district is not remarkable.

PYRITES, a name employed by mineralogists to designate a large group or *family* of minerals, compounds of metals with sulphur, or with arsenic, or with both. They are crystalline, hard, generally brittle, and generally yellow. The name P. originally belonged to the sulphuret of iron, known as IRON P.; and was given to it in consequence of its striking fire with steel (Gr. *pyr.* fire), so that it was used for kindling powder in the pans of muskets before gun-flints were introduced. Iron P. is commonly of a bright brass-yellow color; it is often found crystallized in cubes, in which form small crystals of it are abundantly disseminated in some roofing-slates; and very large ones occur in some of the mines of Cornwall; it is also found crystallized in dodecahedrons and other forms, more rarely in oblique four-sided prisms; and it often occurs massive, globular, stalactitic, capillary, or investing other minerals as an incrustation. Beautiful specimens of globular iron P. are found in the chalk of England. It is a very widely diffused and plentiful mineral, and seems to belong almost equally to all geological formations. It is too abundant in many coal-fields, the action of water and air changing it into sulphate of iron (vitriol), during which change so much heat is evolved that the coal is frequently kindled by it, mines become unworkable, and the progress of the fire can only be stopped, if at all, by building up portions of them to cut off the access of air, or by the admission of a plentiful supply of water. At Quarreltown, in Renfrewshire, a deep hollow may still be seen, where, about a century ago, the ground fell in, in consequence of a subterranean fire thus kindled. The color of Iron P. has often caused it to be mistaken for gold, a mistake which its hardness and comparative lightness should prevent, or its ready solubility in nitric acid, and its burning before the blowpipe on charcoal with bluish flame and smell of sulphur. But it sometimes does contain a small proportion of gold, sometimes even in visible grains. This auriferous Iron P. is found in Siberia and in South America.

Iron P. is never used as an ore of iron, but is much used for the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum.—A variety of Iron P. of a very pale color is called *Marcasite*. There is also a magnetic variety.—**COPPER P.**, also called *Yellow Copper* and *Chalcocopyrite*, is the most abundant of all the ores of copper, and yields a large proportion (perhaps a third) of the copper used in the world. It is brass-yellow, the color varying with the amount of copper which it contains, a rich color indicating much copper, and a pale color the presence of a comparatively large amount of iron; for this ore is not a sulphuret of copper, but of copper and iron. It occurs massive and disseminated in rocks of almost every class; and is often found crystallized in octahedrons and tetrahedrons, but generally in very small crystals. It may at once be distinguished from Iron P. by its comparative softness, yielding readily to the knife, and by the green color of its solution in nitric acid. Before the blowpipe, with borax and soda, it yields a bead of copper. **COBALT P.**, or *Cobaltine*, a sulphuret and arseniuret of copper, is a principal ore of cobalt. It is generally of a silver-white color, and occurs massive, disseminated, or crystallized in cubes, octahedrons, dodecahedrons, and polyhedrons, in primitive rocks.—**NICKEL P.**, also called *Copper-Nickel* and *Nickeline*, used as an ore of nickel, is a compound of nickel and arsenic. It generally found massive, and is of a copper-red color.

PYRITZ, a very ancient town of Prussian Pomerania, in the government of Stettin, 25 miles south-east of the town of Stettin. There are standing five high towers on the town-walls, built by the Wends, under whom it was a place of great strength. There is a seminary named after Otto, Bishop of Bamberg, near the spring where it is said he, in 1124, baptized the first Pomeranian converts. P. has manufactures of woollen cloth and leather. Pop. (1890) 8123.

PYRMONT. See **WALDECK-PYRMONT**.

PYROLA and **PYROLA'CEÆ**. See **WINTER GREEN**.

PYROLIGNEOUS ACID, or **WOOD VINEGAR**, a crude commercial form of Acetic Acid (q. v.). It is made by the destructive distillation of wood, and contains, besides acetic acid, tar and other products, which have to be removed if it is required in a

very pure state. Generally, it is obtained in Britain from oak branches, which, after being stripped of their bark, are too small for timber purposes. These are cut into short billets, which are placed in cast-iron retorts, and a sufficient heat applied to drive off the volatile constituents and carbonize the wood. The best woods for the distiller are 'hard' woods, although all will yield it. This will be seen from the following table, which partly summarizes the experiments of Stolze:

	100 Parts of Dried Wood give	
	Crude Pyro-ligneous Acid.	Pure Hydrated Acetic Acid.
Birch (<i>Betula alba</i>).....	45.0	4.47
Beech (<i>Fagus sylvatica</i>).....	44.0	4.29
Oak (<i>Quercus robur</i>).....	43.0	3.88
Ash (<i>Fraxinus excelsior</i>).....	46.8	3.72
White Poplar (<i>Populus alba</i>).....	45.8	3.23
Bird Cherry (<i>Prunus padus</i>).....	47.3	2.92
Juniper (<i>Juniperus communis</i>).....	45.8	2.34
Spruce Fir (<i>Pinus abies</i>).....	41.2	2.16
Scotch Fir (<i>Pinus sylvestris</i>).....	42.4	2.14

Quick distillation is always found to be much more productive than slow, and the acid is also freer from impurities; for the slower the process, the thicker and darker is the tarry matter. Hence two separate plans have been invented, one by Mr. Halliday, and the other by Mr. W. H. Bowers, both of Manchester, in which sawdust, chips, shavings, and spent dye-woods are used. In Mr. Halliday's plan, the retort is a long tube, with the fire acting along its entire length; inside is an Archimedean screw, worked by machinery, which passes the sawdust or other material slowly from the commencement to the end, where, by a particular contrivance it falls out in the state of thoroughly carbonized wood. It is supplied by means of a hopper. The volatile matters pass up an outlet-pipe in the upper part of the tubular retort. In Mr. Bowers's plan, the principle is similar, though differently carried out, as seen in the wood-cut. *a* is the hopper through

which the sawdust is fed; and it is always kept well supplied, so that, by the pressure of the supply, the escape of vapor may be prevented; *ggg* is an endless chain worked over the four rollers by a small steam-engine, and carrying the materials from the hopper by means of projections on the chain along the lower side of the retort, so as to bring them in contact with the furnace *d*, which, after passing along in the direction of the arrow, has its flue at *e*. By the time the material reaches the bottom, all the volatile matters have been vaporized, and have passed up into the condenser at *ff*, and the carbonized material falls into a cistern of water at *z*, into which the open end of the retort dips, the water closing it sufficiently. One of these retorts will yield about 200 gallons per day of pyroligneous acid. This acid is of great use in the arts, especially in making the acetates used by dyers and calico printers; and it is also, when very carefully purified and properly diluted with water, used extensively as a substitute for common vinegar in pickling, and even for table use.

PYROMANCY. See DIVINATION.

PYROMANIA is an involuntary, motiveless tendency to destroy by means of fire. The blind instinct to burn is often manifested in children before reason or a knowledge of property can actuate them, and with no other object than mischievous destructiveness, or to enjoy the blaze of a conflagration. In a large number of the cases, where legal investigation has disclosed the mental condition of the incendiary, and where the motive could not be determined, or was obscure or inadequate, the perpetrators were youthful, of the female sex, and about the period of puberty. It is to be observed that the most remarkable example in modern times of this morbid tendency appearing epidemically, was presented in Normandy in 1830, where barns, granges, and vineyards over a large tract of country were consumed, and where the actors were exclusively girls. When apprehended in numbers, they confessed that, though prompted by internal sensations, they had no other explicable purpose than to see the light. But this is the pure and typical form of the propensity. In general, insane incendiarism is the result of, or is complicated with, a very obvious incentive. Jonathan Martin, being insane,

but impelled by superstition, set fire to York Minster (1829); and passions and delusions of every character, personal and political antipathies, and the spirit of agrarian outrage, may seek gratification in this kind of desolation. Like other outbursts of frenzy, it has been observed to accompany famines, pestilences, and great social convulsions.—Feuchtersleben, p. 293; Marc, *De la Folie*, t. ii. p. 305.

PYRO-METER (Gr. *pyr*, fire, and *metron*, a measure) is a term originally applied by Muschenbroek in 1731, to an instrument which he invented for measuring the changes produced in the dimensions of solid bodies by the application of heat. It is, however, now applied to any instrument the object of which is to measure all gradations of temperature above those that can be indicated by the mercurial Thermometer (q. v.). Desaguliers gives a description of Muschenbroek's instrument, as improved by himself, in his *Experimental Philosophy*. Numerous pyrometers have since been invented, amongst which may be noticed those of Elliott (described in *The Philosophical Transactions* for 1736 and 1751), Graham (in Do. for 1754), Wedgwood (in Do. for 1782, 1784, and 1786), and Guyton (in the *Annales de Chimie*, tome 46). None of these instruments, however, gave accurate results for very high temperatures; and it was not till the year 1821 that Professor Daniell announced the invention of his pyrometer, which has supplanted all others, and for which, in an improved form, he received the Rumford Medal from the Royal Society. It consists of two distinct parts, the register (1) and the scale (2). The register is a solid bar of black-lead earthenware, A, eight inches long, cut out of a common black-lead crucible. In the axis of this, a hole is drilled, reaching from one end of the bar to within half an inch of the other extremity; and in this cylindrical cavity a bar, *aa*, of metal (as platinum or iron, for example) is placed.

A cylindrical piece of porcelain, *cc*, sufficiently long to project a short distance beyond the extremity of the black-lead bar, is placed on the top of the metallic bar. This is termed the index, and it is kept firmly in its position by a ring or strap of platinum, *d*, which is tightened by a wedge of porcelain, *e*. When the register is exposed to a high temperature, the expansion of the metallic rod, *aa*, forces the index forward; and when the register has afterwards cooled, the tension of the strap will retain the index at the furthest point to which it has been protruded. The scale (2) consists of a frame composed of two rectangular plates of brass, *f*, *g*, joined together by their edges at a right angle, and fitting square upon two sides of the register. Near the end of this frame is a small brass plate, *h*, which projects at a right angle. To the

Daniell's Pyrometer.

extremity of the frame nearest the brass plate is attached a movable arm, D, turning round a fixed center, *i*, and at its free end carrying the arc of a circle, E, the radius of which is five inches, and which is accurately graduated into degrees and thirds of a degree. Upon this arm, at the center, *k*, another lighter arm, C, is made to turn, carrying at its longer part a Vernier (q. v.), H, which moves on the face of the arc, and divides it into minutes, together with an eye-glass, *l*, to assist the reading; while the shorter part terminates in a knife-edge, *m*, turned inwards at a right angle.

To use the instrument, the scale is carefully applied, the brass plate, *h*, being pressed upon the shoulder of the register, and the lighter arm being so placed that the steel point, *m*, may rest on the top of the index in a notch cut for it which coincides with the axis of the rod. The position of the index being then read off on the scale, the register is detached and exposed to the heat to be measured; after it is removed and cooled, it is again placed in the

scale, and the new position of the index read off; the difference of the two readings determining the expansion of the metallic bar above that of the black-lead. In order to employ the instrument as a measure of temperature as well as of expansion, Professor Daniell adopted the doubtful assumption that equal increments of length are the effects of equal increments of temperature. For further information on this instrument and its uses, we must refer to the original memoir in the *Philosophical Transactions* for 1830—1831.

In the Great Exhibition of 1851, Mr. Ericsson exhibited in the United States' department a pyrometer in which temperatures were indicated by the tension of a permanent volume of air or of nitrogen gas, which was measured by the reading of a column of mercury under a vacuum. For a description of the instrument, we must refer to the Jury Report. M. Edmund Becquerel published, in 1864, a very complete essay on pyrometry in the *Annales du Conservatoire*.

PYROPE, a beautiful and much-prized gem, often called *Carbuncle* and *Hyacinth* by lapidaries. It is nearly allied to a garnet. It is composed of silica, alumina, magnesia, lime, and the protoxides of iron, chrome, and manganese. It is always of a deep red color, and is transparent, or at least translucent. It generally occurs in roundish grains, but rarely in imperfectly cubical crystals. It is found chiefly in Saxony and Bohemia; also at Elie, in Fife, Scotland. The specimens found at Elie are popularly called *Elie Rubies*.

PYROPHORUS (from the Gr. *pyr*, fire, and *phero*, I bear) is a term applied to any substances which take fire from the rapidity with which they are oxidized. If iron, cobalt, or nickel be reduced by hydrogen from its oxide at a low red heat, it is obtained in a state of such extreme division as to become incandescent by the oxidizing action of the atmosphere; and the tendency to rapid oxidation is much increased by the interposition of some infusible matter, as a little alumina or magnesia, between the particles of the oxide. This is probably due to the cohesion of the minute particles of the reduced metal being thus mechanically prevented, and the access of air to the surface of each particle being thus facilitated. If tartrate of lead be heated in a tube till the organic portion becomes charred, the metallic lead is reduced to a state of extreme subdivision, and usually takes fire when poured into the air. If finely-powdered sulphate of potash be mixed with half its weight of lampblack, and heated in a covered crucible, the sulphate is reduced to sulphide of potassium, which remains in a finely-divided state, mixed with the excess of carbon, and takes fire spontaneously in the air from the rapid absorption of oxygen. These are amongst the best examples of pyrophori.

PYROSIS, or **WATERBRASH**, is a modification of dyspepsia, or indigestion, characterized by a burning sensation at the pit of the stomach, followed by the eructation of a considerable quantity of a thin, watery fluid, which is generally tasteless, but sometimes sour, and is often described by the patient as being cold. It occurs in paroxysms, which usually come on in the morning or forenoon, when the stomach is empty. The first symptom of it is a pain at the pit of the stomach, and a sense of constriction, as if the stomach were drawn towards the back. The pain is often very severe, and after continuing for some time it brings on the discharge of fluid which has been already mentioned, after which it lessens, and gradually disappears. When the attack has once occurred, it is commonly repeated at intervals for a considerable time. It is usually accompanied with other symptoms of dyspepsia, and is sometimes associated with organic disease of the stomach, or of the liver. It seems to be due in a great measure to indigestible diet, and the too free use of spirits. When no organic disease is present, the affection usually disappears under the use of well-regulated diet, and the administration of opium, combined with astringents (as in the Compound Kino Powder), care being taken to guard against the constipating effect of these drugs by the prescription of a mild aperient daily, as, for example, a little confection of senna, or three grains of the Compound Colocynthis Pill, combined with two grains of Extract of Hyoscyamus. If this treatment fail, nitrate of bismuth, or oxide of silver, in appropriate doses, may be tried. In some cases a cure has been effected by the use of lime-water and milk.

PYROSOMIDÆ, a family of tunicated molluscs forming the order *Dactylobranchiata* of Owen. They are marine, and swim freely in the water, many individuals usually combined together, by their elastic integument or *tunic*, into a mass of definite form and arrangement, nearly cylindrical, hollow, closed at one end, and open at the other. The individuals which form this group or mass have each a gill-sac with two gills, and inhale water by an orifice on the outer surface of the cylinder, expelling it by another orifice on the inner surface; and by the action of the stream of water which thus constantly flows from the open end of the cylinder, the whole mass is slowly compelled through the water with the closed end foremost. The P. are plentiful in warm seas.

Pyrosoma Atlanticum is usually from three to seven inches long. The P. are brightly luminous.

PYROTECHNY, the art of making fireworks, is of unknown antiquity. It was practised amongst the Chinese from the earliest times, and has attained with them a perfection unknown in other countries. So much is this the case, that they treat as insignificant the most brilliant of our European displays. In their fireworks they introduce many surprises, such as figures of men and animals darting out, but they are somewhat deficient in the mechanical arrangements. Fireworks, as the name is now understood, were hardly known in Europe until the discovery of the composition of gunpowder, and for a long time only very simple pyrotechnic contrivances were used. At present they may be divided into two kinds—the simple hand-pieces, such as squibs, crackers, rockets, &c.; and the other, the fixed contrivances which have often very ingenious mechanical arrangements for making some of their parts revolve rapidly when being discharged. The materials used are gunpowder, sulphur, charcoal, saltpetre, filings of steel, iron, copper, &c., and several salts, such as nitrate of strontian, acetate of copper, common salt, &c.

The ingredients of fireworks are usually filled into paper cases, made by rolling pasted paper round a cylinder of wood of the proper diameter, until the case is of sufficient thickness, and then cutting the paper tube so formed into the required lengths for squibs, Roman candles, small rockets, and similar articles; they seldom exceed ten inches; one end of each is closed by drawing a piece of string tightly round, so as to pinch it in, or *choke* it as it is technically called, and then dipping it into melted resin, which effectually seals it (a, figs. 1, 2, and 3). The combustible ingredients are filled in at the open end, and, if necessary, are rammed down with a wooden ramrod; the opening is afterwards covered with a piece of touch-paper, to prevent the composition falling out, and to ignite it by (b, figs. 1, 2, and 3). The effects

Fig. 1.

Fig. 2.

produced by fireworks are either streams of fire issuing straight out of the cases, and much varied with sparks in the form of stars, &c., and colored with brilliant colors; or wheels of beautiful sparks produced by making the cases revolve rapidly. Revolving pieces are made by coiling the paper tube, when not too tightly filled, around a flat wooden center (c, fig. 2); the force with which the combustion of the materials is carried on, is sufficient to make the board revolve with great rapidity. Small wheels of this kind are called *Catharine Wheels* (fig. 2). *Squibs* or *serpents* are made by filling tubes, eight to ten inches in length (fig. 1), with a composition of 1 lb. of nitre, 2 oz. of charcoal powder (rather coarse), 4 oz. of gunpowder, 4 oz. of sulphur, and 6 oz. of steel filings. The last is an important ingredient in many fireworks, producing brilliant, feather-like coruscations, which are the more beautiful the larger and cleaner the filings are. *Rockets* are tied to a wooden stick (c, fig. 3).

Figs. 3 and 4.

When they are about to be discharged, this stick is stuck in the ground, and in that position the igniting point of the rocket, b, is downward; when lighted, it rushes into the air with great velocity, and reaches a considerable height, discharging as it goes a brilliant stream of sparks. Rockets require a hollow center all down the tube; without this, they will not rise. At the end of their course, they often discharge brilliant clusters of golden, ruby, emerald, sapphire-like stars, or showers of golden or colored rain, or of fiery serpents. This is produced by a supplementary part, called the *garniture* of the rocket, consisting of a shorter and broader paper tube called the *pot*, attached to the end of the fusée part of the rocket (as in fig. 4, a), and filled with a composition made into a paste with pure alcohol, and cut into stars, or granu-

lated into small round bodies for drops. The serpents for rockets are small fuses, with the same composition as squibs; they are so packed in as to ignite all at once. The white stars are made of nitre, 16 parts; sulphur, 8 parts; gunpowder, 3 or 4 parts; nitrate of strontian added, makes them ruby red; sulphate or acetate of copper, and sulphate and carbonate of barytes, green; zinc filings give a blue color. *Yellow stars* and *yellow showers* are made of nitre, 16 parts, 10 of sulphur, 4 of charcoal, 16 of gunpowder, and 2 of lamp-black. A deeper and richer golden color is produced by a very slight variation in the composition—viz., 2 parts less of sulphur and charcoal, and four additional of gunpowder. Many other ingenious devices are used by masters in the art of pyrotechny, but they are too numerous and too technical to come within the limits of this work. The *Roman candle* is a favorite firework; it is a tube which is held on the ground, and discharges upwards a continuous stream of blue or white stars or balls. *Bengal lights* are cases of about an inch or more in diameter, filled with a composition of 7 parts nitre, 2 of sulphur, and 1 of antimony. These are much used as signals at sea; they diffuse an immense glare of bluish-white light. *Chinese* or *jasmine fire*, which is used by itself or in combination with other mixtures, consists of 16 parts of gunpowder, 8 of nitre, 3 of finely-powdered charcoal, 3 of sulphur, and 10 of small cast-iron borings; the last must be finer or coarser in proportion to the bore of the case to be filled. The compound devices in fixed fireworks, such as are seen at public entertainments, are very complicated in their structure, and are varied more or less by every artist. One nice point in the arrangement is to insure simultaneous ignition of all the various parts.

PYROXENE. See AUGITE.

PYROXYLIC SPIRIT, WOOD SPIRIT, or METHYLIC ALCOHOL, a peculiar alcohol obtained by the destructive distillation of wood in the manufacture of Pyroligneous Acid (q. v.). It is one of numerous volatile products of that distillation, and has to be separated from the others by saturating it with the chloride of calcium, with which it combines, and is no longer volatile, except at a greater temperature than 212° F. It is therefore easily separated by means of a steam-bath from its more volatile associates, which are carried off at a temperature below boiling water. A higher temperature is afterwards applied to the residue, which is the compound of chloride of calcium and pyroxylic spirit, and the spirit is thus distilled off. Commercially, the discovery of this substance was of great importance, as many of its properties are the same as those of common alcohol; and now, notwithstanding a long opposition from the Revenue Board, its manufacture and importation are regularly allowed. It is of nearly equal value to alcohol in making varnishes, as it dissolves the resins, oils, and other similar substances. It has a peculiar naphtha-like odor, which is inseparable from it, and prevents its use as a potable spirit at present; but it has been asserted lately that some makers have almost made it odorless, and that it is consequently taking the place of common alcohol in the manufacture of cheap perfumes.

PYROXYLIN, a name for Gun Cotton (q. v.).

PYRRHIC DANCE, the most famous of all the war-dances of

antiquity, is said to have received its name from one Pyrrichos, or, according to others, from Pyrrhus or Neoptolemus, the son of Achilles. Critical scholars, however, content themselves with a general inference deduced from the substantial harmony of the various mythical or legendary accounts given of its origin—viz., that it was a Doric invention. It was danced to the flute, and its time was both quick and light, as may be seen from the Pyrrhic foot, composed of two shorts (—), and the Prokleusmatic, or challenging-foot, of two double shorts (—). According to Plato, it aimed to represent the nimble motions of a warrior either avoiding missiles and blows, or assaulting the enemy; and in the Doric states, it was as much a piece of military training as an amusement. Elsewhere, in Greece, it was purely a mimetic dance, in which the parts were sometimes represented by women. It formed part of the public entertainments at the Panathenaic festivals. Julius Cæsar introduced it at Rome, where it became a great favorite. The *Romaika*, still danced in Greece, is said to be a modern relic of the ancient Pyrrhic dance; but if the accounts of recent travelers in the Hellenic kingdom are to be relied on, it is not easy to see the resemblance.

PYRRHON (Lat. *Pyrrho*), the founder of a school of Greek scepticism, named after him, was a native of Elis, and was born in the first half of the 4th c. B.C. In his youth he is said to have been a painter, but was subsequently attracted to philosophy by the study of the writings of Democritus. Diogenes Laertius tells us that, along with Anaxarchus (one of his teachers, according to Aristotle), he joined Alexander the Great's eastern expedition; and it has been conjectured that, at this period, he obtained some knowledge of the opinions and beliefs of the Persian Magi and the Indian Gynnosophs. He died about the age of 90, after spending a great part of his life in retirement. P.'s scepticism was by no means of the thorough-going kind that is usually associated with his name, which is synonymous with absolute and unlimited infidelity. He certainly disbelieved in the possibility of acquiring a scientific knowledge of things, but (like Kant) he appears to have tenaciously maintained the reality of virtue and the obligations of morality. So greatly was he revered by his townsmen, on account of his personal excellences, and so little did they consider his philosophical scepticism a barrier to his holding a religious office, that they chose him high-priest of their sacred city, and for his sake declared all philosophers exempt from public taxes. Cicero (not so far wrongly either) ranks him among the Socratics; and, indeed, he was as much opposed to the pretensions of the Sophists as Socrates himself, though from a different point of view. P., so far as we know, wrote nothing; and the works of his friend and follower, Timon, are lost.

PYRRHUS, king of Epeirus, born about 318 B.C., a Greek warrior, whose personal bravery and passion for adventurous exploits equals anything recorded of the knights of chivalry, was the son of Acæides, who succeeded to the throne of Epeirus by the death of his cousin, Alexander, 326 B.C. Alexander was the brother of Olympias, the mother of Alexander the Great; and thus young P. was a distant kinsman of the Macedonian hero, whose career of far-stretching conquest he dared to dream of imitating. After experiencing many vicissitudes of fortune in his youth, he became sole king of Epeirus in 295 B.C.; and, in the following year, increased his territories by the addition of the western parts of Macedonia, which he obtained in reward for aiding Alexander, son of Cassander, against his brother, Antipater, in their struggle for the paternal inheritance. In 281 B.C., a glorious prospect opened up before the eyes of the restless warrior—nothing less than the conquest of Rome and the western world, which (if he should achieve it) would confer on him a renown equal to that of his Macedonian kinsman. The Tarentines, a Greek colony in Lower Italy, then at war with the Romans, sent an embassy to P., in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. The king was overjoyed at the proposal; instantly accepted it; and in the beginning of 280 B.C. sailed for Tarentum with 20,000 foot, 3000 horse, 2000 archers, 500 slingers, and a number of elephants. The gay, pleasure-loving Tarentines had no great relish for the rigorous service of war, and were far from pleased at the strict measures taken by P. to inure them to its hardships.

The first battle between P. and the Romans (who were commanded by the consul M. Valerius Laevinus) took place at the river Siris in Lucania. The contest was long, obstinate, and bloody; and P. only succeeded by bringing forward his elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans. It was a hard-bought victory for P., who said, as he looked upon the field, thick-strewn with his numerous dead: 'Another such victory, and I must return to Epeirus alone.' Many of the Italian nations now joined P. (for Rome was not liked by her neighbors and dependents), and he proceeded on his march towards Central Italy. The Roman senate was thoroughly frightened, and would have come to terms with P., but for the stirring speech of old Ap. Claudius Cæcus, which made them re-

Pyrrhic Dance.

(Copied from Sir W. Hamilton's work on *Greek and Roman Vases*.)

solve to 'fight it out' with the foreigner. P., after penetrating to within 20 miles of Rome, found it impossible to proceed further with safety, as one Roman army occupied the city, and another hung upon his flanks and rear. He therefore withdrew to Campania, and thence to Tarentum, where he wintered. The campaign of 279 B.C. was carried on in Apulia, and the principal engagement took place near Asculum. The Romans were again defeated; but P. himself lost so heavily, that he felt it impossible to follow up his victory; and again withdrew to Tarentum. Here a truce was entered into between the belligerents; and P. passed over into Sicily to assist the Sicilian Greeks against the Carthaginians, 278 B.C. His first exploits in that island were both brilliant and successful; but the repulse which he sustained in his attack on Lilybæum broke the spell which invested his name.

Soon afterwards he became involved in misunderstandings with the Greeks; and in 276 B.C. he quitted the island in disgust, to renew his war with Rome. While crossing over to the mainland the Carthaginians attacked him, and destroyed 70 of his ships; and although he reached Tarentum in safety, his prospects were now much more clouded than at first. In 274 B.C. he fought a great battle with the Romans, under the consul Curius Dentatus, near Beneventum, and was utterly defeated, escaping to Tarentum with only a few personal attendants. He now saw himself forced to abandon Italy and return to Epeirus, where he almost immediately engaged in war with Antigonus Gonatas, son of Demetrius, and king of Macedonia. His success was complete, for the Macedonian troops deserted to him *en masse*, and he once more obtained possession of the country; but nothing could satisfy his love of fighting, and in less than a year he was induced to enter on a war with the Spartans. He marched a large force into the Peloponnesus, and tried to take their city, but was repulsed in all his attempts. He then proceeded against Argos, where he met his death, 272 B.C., in the 46th year of his reign.

PY'RUS, a genus of trees and shrubs of the natural order *Rosaceæ*, suborder *Pomeæ*, having a 5-celled fruit, with a cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the characters of the flower and fruit, and formerly constituting the genera *Sorbus*, *Aria*, *Aronia*, &c.; or included in *Mespilus* (see MEDLAR) and *Crataegus*. Some botanists separate the Apples (*Malus*) as a distinct genus. Amongst the species of P. are some of the most valuable fruits of temperate climates, and some highly ornamental trees and shrubs. See APPLE, PEAR, SERVICE, ROWAN, BEAM-TREE.

PYTHA'GORAS. The life of this celebrated man, the founder of what is known as the Italic School of Philosophy, has been so greatly obscured by the mass of legends and incredible stories which gathered in later ages round his name, that it is very difficult to arrive at anything like certainty regarding his history and character. That he was a native of the island of Samos, the son of Mnesarchus, a merchant, or, according to other accounts, a signet-engraver, we know on good authority. The date of his birth is very uncertain, but is usually placed about the year 570 B.C.; and all authorities agree that he flourished in the times of Polycrates and Tarquinius Superbus (540—510 B.C.). He is said to have been a disciple of Pherecydes of Syros, of Thales, and Anaximander, and, like other illustrious Greeks, to have undertaken extensive travels for the purpose of adding to his knowledge; in the course of which—lasting, we are told, for nearly 80 years—he visited Egypt (bringing with him, according to the usual story, letters of introduction from Polycrates to Amasis the king) and the more important countries of Asia, including even India. We have every reason to believe that he did, at all events, visit Egypt, and there availed himself of all such mysterious lore as the priests could be induced to impart; from whom possibly he learned the doctrine of Metempsychosis, or the transmigration of souls (which was, as is well known, one of the most famous tenets of the Pythagorean school), and whose influence may perhaps be traced in the mystic rites, asceticism, and peculiarities of diet and clothing which formed some of his chief characteristics—though we may consider it as nearly certain that his philosophic and religious system was much less indebted to the influence of other countries than the ancients generally believed.

During his travels, we may believe, P. matured the plans which he afterwards carried into action; but finding, on his return to his native island, that the tyranny established there by Polycrates unfitted it for his abode, he quitted Samos, and eventually settled in the city of Croton, in Southern Italy. Here he is said to have acquired in a short time unbounded influence over the inhabitants, as well as over those of the neighboring states; and here he established the famous Pythagorean fraternity or order, which has often been compared with the still more celebrated order founded by Ignatius Loyola in modern times. The adherents of P. were chiefly found among the noble and the wealthy; these, to the number of 300, he formed into a select society, bound by a sort of vow to himself and to each other, for the purpose of studying

the philosophical system of their master, and cultivating the ascetic observances and religious rites enjoined by him. They thus formed at once a philosophical school and a religious brotherhood, which gradually assumed the character and exercised the power of a political association also. This political influence, which undoubtedly became very great, was constantly exerted on the side of aristocracy; and to carry out the principles of this form of government, understood in the best sense of the word, seems to have been the ultimate aim of Pythagoras. He is said also to have increased his influence by a practice unknown to the other sages of the ancient world—the admission of women, not probably into his society, but to attendance on his lectures and teaching. Of the internal arrangement and discipline of this fraternity we really know but little. All accounts agree that what was done and taught among the members was kept a profound secret from the outer world.

In the admission of members, P. is said to have exercised the greatest care, and to have relied much on his skill in physiognomy. They then had, it is said, to pass through a long period of probation, intended apparently to test especially their powers of endurance and self-restraint—though probably the assertion that they had to maintain silence for two or even five years is an exaggeration of later times. Among the members of the society we are told there were several gradations, and there was also a more general division of his disciples under the names *Esoteric* and *Exoteric*—the former being applied to all who were admitted to the more abstruse doctrines and sublimer teaching of their master, the latter to those who received only the instruction open to all. The mode of life seems to have been regulated by P. in its minutest details. It is well known that he is said to have forbidden all animal food—a consequence, perhaps, of the doctrine of Metempsychosis—and also particularly beans (but these statements cannot be relied on), and there is no doubt that temperance of all kinds was strictly enjoined. In the course of instruction, great attention was paid to mathematics, music and astronomy; and gymnastics formed an important part of the training. Religious teaching was inculcated in the so-called Pythagorean *Orgies* or *Mysteries*; and while he outwardly conformed to the usual mode of worship, there is reason to believe that in secret he taught a purer faith. The result of the whole system seems to have been an unbounded reverence on the part of the disciples for their master (of which the well-known *ipse dixit* is a sufficient attestation); in the members of the order an elevated tone of character, exhibited in serenity of mind and self-possession, extreme attachment to each other, and also supreme contempt for all the outer world.

But it was natural that political power uniformly exercised in one direction by an aristocratic and exclusive society such as this should in the end excite a wide-spread feeling of jealousy and hatred, which at length, when opportunity was given, caused the overthrow of the fraternity. A war between the cities of Croton and Sybaris, in which the Pythagoreans took a prominent part, ended in the total destruction of the latter city (510 B.C.); and on this success they seemed to have presumed so greatly, that they proceeded to more active measures against the popular party than they had yet attempted. A violent outbreak was the consequence; the house in which the leading Pythagoreans were assembled was set on fire, and many perished in the flames. Similar commotions ensued in other cities of Southern Italy in which Pythagorean clubs had been formed, and the result was that, as a political organization, the Pythagorean order was everywhere suppressed; though, as a philosophical sect, it continued to exist for many years after. Of the fate of P. himself different accounts are given; but he is generally supposed to have escaped to Metapontum, and died there (504 B.C.) where his tomb was shown in the time of Cicero.

P. is said to have been the first to assume the title of *Philosopher* ('Lover of wisdom') in place of the name *Sophos* ('Wise'), by which the sages had before been known. Various discoveries in music, astronomy, and mathematics are attributed to him; among others, the proposition now known as the 47th of Euclid, Book I. We have good ground for believing that he was a man of much learning and great intellectual powers, which were specially exerted in the way of mathematical research, as is evinced by the general tendency of the speculations of his school. There is no doubt that he maintained the doctrine of the transmigration of souls into the bodies of men and other animals—which seems to have been regarded in the Pythagorean system as a process of purification—and he is said to have asserted that he had a distinct recollection of having himself previously passed through other stages of existence. We are told that on seeing a dog beaten, and hearing him howl, he bade the striker desist, saying, 'It is the soul of a friend of mine, whom I recognize by his voice.'

Respecting the system of philosophy actually taught by P., we have but little trustworthy testimony. P. himself, it is all but certain, wrote nothing, and the same seems to have been the case with his immediate successors; we are therefore, in endeavoring

to form an idea of the Pythagorean philosophy, obliged to rely almost entirely on the compilations of later writers (mainly Diogenes Laërtius, and the Neo-Platonists, Porphyrius and Iamblichus, all of them long subsequent to the Christian era), who often but imperfectly understood the details they gave. The tendency of the school was 'toward the consideration of abstractions as the only true materials of science' (Lewes's *Biographical History of Philosophy*), and to *Number* was allotted the most prominent place in their system. They taught that in *Number* only is absolute certainty to be found; that *Number* is the Essence of all things; that things are only a copy of *Numbers*; nay, that in some mysterious way, *Numbers* are things themselves. This *Number* theory was probably worked out from the fundamental conception, that, after destroying or disarranging every other attribute of matter, there still remains the attribute *Number*; we still can predicate that the thing is *one*. With this doctrine of *Number* was intimately connected that of the *Finite* and the *Infinite*, corresponding respectively with the *Odd* and the *Even* in *Number*; and from a combination of this *Finite* and *Infinite* it was taught that all things in the Universe result. The abstract principle of all perfection was *One* and the *Finite*; of imperfection, the *Many* and the *Infinite*. Essentially based also on the same doctrine, was the Theory of Music; the System of the Universe, which was conceived as a *Kosmos*, or one harmonious whole, consisting of ten heavenly bodies revolving round a Central Fire, the *Hearth* or *Altar* of the Universe; and the celebrated doctrine of the Harmony of the Spheres—the music produced, it was supposed, by the movement of these heavenly bodies, which were arranged at intervals according with the laws of harmony—forming thus a sublime Musical Scale. The Soul of Man was believed to partake of the nature of the Central Fire, possessing three elements, Reason, Intelligence, and Passion; the first distinctive of Man, the two last common to Man and Brutes.

The Ethical teaching of the Pythagoreans was of the purest and most spiritual kind; Virtue was regarded as a harmony of the soul, a conformity with, or approximation to, the Deity; Self-Restraint, Sincerity, and Purity of Heart were especially commended; and Conscientiousness and Uprightness in the affairs of life would seem to have been their distinguishing characteristics.

The Pythagorean system was carried on by a succession of disciples down to about 300 B.C., when it seems to have gradually died out, being superseded by other systems of philosophy; it was revived about two centuries later, and lasted for a considerable time after the Christian era—disfigured by the admixture of other doctrines, and an exaggeration of the mysticism and ascetic practices, without the scientific culture of the earlier school.

In addition to the writers above mentioned, scattered and scanty notices—affording, however, really the most trustworthy information that we possess, as to the life and doctrines of P.—occur in Herodotus, Plato, Aristotle (the latter especially), and a few other authors. Fuller details on the subject will be found in the Histories of Greece by Thirlwall and Grote, in the works of Ritter, Brandis, Tennemann, Erdmann, Ueberweg, and Lewes on the *History of Philosophy*; in Zeller's *Philosophie der Griechen*, and Ferrier's lectures on the same subject; and in Smith's *Dictionary*.

PYTHIAN GAMES, one of the four great national festivals of the Greeks, held in the Crissæan plain, near Delphi, are said (according to the prevalent mythological legend) to have been instituted by Apollo after vanquishing the snaky monster, Python, and were certainly in the earliest times celebrated in his honor every ninth year. They were at first under the management of the Delphians, but about 590—586 B.C. the Amphictyons were intrusted with the conduct of them, and arranged that they should be held every fifth year. Some writers state that it was only after this date that they were called Pythian. Originally, the contests were restricted to singing, with the accompaniment of cithern-playing, but the Amphictyons added the flute, athletic contests, and horse-racing. By and by, contests in tragedy, and other kinds of poetry, in historical recitations, and in works of art, were introduced, and long continued a distinguishing feature of these games, which are believed to have lasted down to nearly the end of the 4th c. A.D. The prize was a laurel wreath and the symbolic palm-branch. Several of Pindar's extant odes relate to victors in the Pythian Games.

PYTHON, a genus of serpents of the family *Boïdæ* (see *BoA*), differing from the true boas in having the plates on the under sur-

face of the tail double. The tip of the muzzle is plated; the lips are grooved. The species are all natives of the Old World. They are all large; some of them very large, and rivalled in size by no serpents except the boas of America. The name *Boa* is often popularly given to the pythons, and in its ancient use belongs to them. Some of the pythons are known in the East Indies by the name of **ROCK SNAKE**, as *P. molurus*, a species very extensively diffused. This name is given to some species which belong to the genus or subgenus *Hortulia*, one of which, the **NATAL ROCK SNAKE** (*H. Natalensis*), is said to attain so large a size that its body is as thick as that of a man. Although a native of Natal, it is already unknown in the settled parts of the colony. *Python reticulatus* is probably the largest snake of India and Ceylon. It is found also in more eastern regions. What size it attains is not well known. Specimens of 15 or 20 feet long are common, but it certainly attains a much larger size. It seems to be this snake which is sometimes called **ANACONDA**. It is rather brilliantly colored; its body being covered with gold and black, finely inter-

Python, or Rock Snake (*Hortulia Natalensis*).

mixed. The forehead is marked by a longitudinal brown stripe. Although sluggish for some time after a repast, it is at other times very active, and easily scales the highest garden walls. It feeds on deer and smaller animals; but the largest pythons are said to seize buffaloes, tigers, and even elephants, and to crush them in their coils. In this there is perhaps some exaggeration; but there are well-authenticated stories of snakes in the East Indies quite capable of killing at least the buffalo and the tiger (see *My Indian Journal*, by Colonel Walter Campbell; Edin. 1864, pp. 126, 127).

PYX (Gr. *pyxis*, a box, properly of boxwood), the sacred vessel used in the Catholic Church to contain the consecrated eucharistic elements, which are preserved after consecration, whether for the communion of the sick or for the adoration of the faithful in the churches. Its form has varied very much at different times. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver. At present, the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. Like all the other sacred utensils connected with the administration of the eucharist, it must be blessed by a bishop, or a priest delegated by a bishop.

PYX. TRIAL OF THE, the final trial by weight and assay of the gold and silver coins of the United Kingdom, prior to their issue from the Mint. It is so called from the *Pyx*, i. e., box or chest, in which are deposited specimen coins. When the coins are weighed into bags at the Mint, two pieces are taken out of each bag, one for assay within the Mint, the other for the pyx. The latter are sealed up by three officers and deposited in the chest or pyx. The trial takes place about once in three years by a jury of goldsmiths, summoned by the Lord Chancellor. The jury are charged by the Lord Chancellor, at the Exchequer Office, Whitehall, in presence of several privy councillors, and of the officers of the Mint. Being furnished with a piece of gold and silver from the trial plates deposited in the Exchequer, they are required to declare to what degree the coin under examination deviates from them. The jury then proceed to Goldsmiths' Hall, where assaying apparatus is in readiness, and the sealed packets of coin being delivered to them by the officers of the Mint, are first tried by weight, after which a certain number of pieces taken from the whole are melted into a bar, from which the assay trials are taken. A favorable verdict relieves the officers of the Mint from responsibility, and constitutes a public attestation of the standard purity of the coin.

Q.

THE seventeenth letter of the Latin, English, and other western alphabets, is identical in power with the letter K (q. v.). It is always followed by u.

QUADRAGE'SIMA (Lat. 'fortieth day'), the name of the Lenten season, or more properly of the first Sunday of the Lent. It is so called by analogy with the three Sundays which precede Lent, and which are called respectively Septuagesima, 70th; Sexagesima, 60th; and Quinquagesima, 50th.

QUADRA'NGLE, an open square, or courtyard having four sides. Large public buildings—such as Somerset House and the colleges of Oxford and Cambridge—are usually planned in this form.

QUA'DRANT (Lat. *quadrans*, a fourth part), literally the fourth part of a circle, or 90°; but signifying, in Astronomy, an instrument used for the determination of angular measurements. The quadrant consisted of a limb or arc of a circle equal to the fourth part of the whole circumference graduated into degrees and parts of degrees. The quadrant employed by Ptolemy was of stone, with one smooth and polished side, on which the graduations were made; the quadrant was firmly placed in a meridian plane, with one radius vertical, and the other horizontal.

Tycho Brahe, who has a right to be considered as the first great practical astronomer of modern times, fixed his quadrant on a wall, and employed it for the determination of meridian altitudes; he also adjusted others on vertical axes for the measurement of azimuths. Picart was the first who applied telescopic sights to this instrument. About this time the large mural quadrant (of 6 to 8 feet radius) began to be introduced into observatories. These quadrants were adjusted in the same way as the mural circle (see CIRCLE, MURAL). Various innate defects of the quadrant as an instrument—such as the impossibility of securing exactness of the whole arc, concentricity of the center of motion with the center of division, and perfect stability of the center-work—led to its being superseded by the repeating circle, otherwise called the *Mural Circle*.

Hadley's Quadrant is more properly an *octant*, as its limb is only the eighth part of a circle, though it measures an arc of 90°. Its principle is that of the *SEXTANT* (q. v.).

QUADRA'TIC EQUATIONS. See EQUATIONS.

QUA'DRATURE. This term is employed in Mathematics to signify the process of determining the area of a surface. Its derivation sufficiently indicates its nature—i. e., it consists in determining a *square* (the simplest measure of surface) whose area is equal to that of the assigned surface. In many cases, of which the Triangle (q. v.), the Parabola (q. v.), and the Cycloid (q. v.) are perhaps the simplest, the area is easily assigned in terms of some simple unit. Thus, the area of a triangle is half that of the rectangle with the same base and height; that of any parabolic segment is two-thirds of the corresponding triangle, whose sides are the chord and the tangents at its extremities; that of the cycloid three times that of its generating circle, &c.

The term is also applied in a special sense in cases in which an area or other quantity is expressed by an integral, whose value cannot be determined exactly; and it then means the process of approximation by which the value of the integral can be gradually arrived at.

All the practical rules for approximating to the areas of curvilinear figures and the volumes of various solids—such as occur in land-measuring, gauging, engineering, &c.—are, in this sense, cases of quadrature, except in those very special cases in which an area or a volume can be assigned exactly as a finite function of its dimensions. See MENSURATION.

QUADRATURE OF THE CIRCLE. This is one of the grand problems of antiquity, which unsolved and probably unsolvable, continue to occupy even in the present day the minds of many curious speculators. The trisection of an angle, the duplication of the cube, and the perpetual motion have found, in every age of the world since geometry and physics were thought of, their hosts of patient devotees. The *physical* question involved in the Perpetual Motion (q. v.) is treated of under that head; and we shall now take the opportunity of noticing the *mathematical* ques-

tions involved in the other problems above mentioned; but more especially that of the quadrature of the circle, in which the difficulty is of a different nature from that involved in the other two geometrical ones. A few words about them, however, will help as an introduction to the subject.

According to the postulates of ordinary geometry, all constructions must be made by the help of the circle and straight line. Straight lines intersect each other in but *one* point; and a straight line and circle, or two circles, intersect in *two* points only. From the analytical point of view we may express these facts by saying that the determination of the intersection of two straight lines involves an equation of the *first* degree only; while that of the intersection of a straight line and a circle, or of two circles, is reducible to an equation of the second degree. But the trisection of an angle, or the duplication of the cube, requires for its accomplishment the solution of an equation of the *third* degree; or geometrically, requires the intersections of a straight line and a curve of the third degree, or of two conics, &c., *all of which are excluded by the postulates of the science*. If it were allowed that a parabola or ellipse could be described with a given focus and directrix, as it is allowed that a circle can be described with a given radius about a given center, the trisection of an angle and the duplication of the cube would be at once brought under the category of questions resolvable by pure geometry; so that the difficulty in these cases is one of mere restriction of the postulates of what is to be called geometry.

It is very different in the case of the quadrature of the circle, which (the reader of the preceding article will see at once) means the determination of the area of a circle of given radius—literally, the assigning of the side of a square whose area shall be equal to that of the given circle.

The common herd of 'squares of the circle,' which grows more numerous every day, and which includes many men of undoubted sanity, and even of the very highest business talents, rarely have any idea of the nature of the problem they attempt to solve. It will, therefore, be our best course to show first of all *what has been done* towards the solution of the problem; we shall then venture a few remarks as to *what may yet be done*, and in what direction philosophic 'squares of the circle' must look for real advance.

In the first place, then, we observe that *mechanical processes are utterly inadmissible*. A fair approximation may, no doubt, be got by measuring the diameter of a circular disc of uniform material, and comparing the weight of the disc with that of a square portion of the same material of given side. But it is almost impossible to execute any measurement to more than six places of significant figures; hence as will soon be shown, this process is at best but a rude approximation. The same is to be said of such obvious processes as wrapping a string round a cylindrical post of known diameter, and comparing its length with the diameter of the cylinder: only a rude approximation to the ratio of the circumference of a circle to its diameter can thus be obtained.

Before entering on the history of the problem, it must be remarked that the Greek geometers knew that the area of a circle is half the rectangle under its radius and circumference (see CIRCLE), so that the determination of the length of the circumference of a circle of given radius is precisely the same problem as that of the quadrature of the circle.

Confining ourselves strictly to the best ascertained steps in the history of the question, we remark that Archimedes proved that the ratio of the diameter to the circumference is greater than $1\frac{1}{7}$, and less than $1\frac{1}{4}$ to 3. The difference between these two extreme limits is less than the $\frac{1}{1000}$ of the whole ratio. Archimedes's process depends upon the obvious truth, that the circumference of an inscribed polygon is less, while that of a circumscribed polygon is greater, than that of the circle. His calculations were extended to regular polygons of 96 sides.

Little more seems to have been done by mathematicians till the end of the 16th c., when P. Méius gave the expression for the ratio of the circumference to the diameter as the fraction $\frac{355}{113}$, which, in decimals, is true to the seventh significant figure inclusive. Curiously enough, it happens that this is one of the convergent fractions which express in the lowest possible terms the best approximations to the required number. Méius seems

to have employed, with the aid of far superior arithmetical notation, a process similar to that of Archimedes.

Vieta shortly afterwards gave the ratio in a form true to the tenth decimal place, and was the first to give, though of course in infinite terms, an exact formula. Designating, as is usual in mathematical works, the ratio of the circumference to the diameter by π , Vieta's formula is—

$$\frac{1}{\pi} = \frac{1}{2} \sqrt{\frac{1}{2}} \times \sqrt{\frac{1}{2} + \frac{1}{2} \sqrt{\frac{1}{2}}} \times \sqrt{\frac{1}{2} + \frac{1}{2} \sqrt{\frac{1}{2} + \frac{1}{2} \sqrt{\frac{1}{2}}}} \times \&c.$$

Shortly afterwards, Adrianus Romanus, by calculating the length of the side of an equilateral inscribed polygon of 1073741824 sides, determined the value of π to 16 significant figures; and Ludolph von Ceulen, his contemporary, by calculating that of the polygon of 36893488147419103232 sides, arrived (correctly) at 36 significant figures. It is scarcely possible to give, in the present day, an idea of the enormous labor which this mode of procedure entails even when only 8 or 10 figures are sought; and when we consider that Ludolph was ignorant of logarithms, we wonder that a lifetime sufficed for the attainment of such a result by the method he employed.

The value of π was thus determined to $\frac{1}{3} \times 10^{36}$ of its amount, a fraction of which, after Montucla, we shall attempt to give an idea, thus: Suppose a circle whose radius is the distance of the nearest fixed star (250,000 times the earth's distance from the sun), the error in calculating its circumference by Ludolph's result would be so excessively small a fraction of the diameter of a human hair as to be utterly invisible, not merely under the most powerful microscope yet made; but under any which future generations may be able to construct.

These results were, as we have pointed out, all derived by common arithmetical operations, based on the obvious truth that the circumference of a circle is greater than that of any inscribed, and less than that of any circumscribed polygon. They involve none of those more subtle ideas connected with Limits, Infinitesimals, or Differentials, which seem to render more recent results suspected by modern 'squares.' If one of that unhappy body would only consider this simple fact, he could hardly have the presumption to publish his 3.125, or whatever it may be, as the accurate value of a quantity which by common arithmetical processes, founded on an obvious geometrical truth, was several centuries ago shown to be greater than

$$3.14159265358979323846264338327950288,$$

and less than

$$3.14159265358979323846264338327950289.$$

We now know, by far simpler processes, its exact value to more than 600 places of decimals; but the above result of Von Ceulen is much more than sufficient for any possible practical application even in the most delicate calculations in astronomy.

Suelli, Huyghens, Gregory de Saint Vincent, and others, suggested simplifications of the polygon process, which are in reality some of the approximate expressions derived from modern trigonometry.

In 1668 the celebrated James Gregory gave a demonstration of the impossibility of effecting exactly the quadrature of the circle, which, although objected to by Huyghens, is now received as quite satisfactory.

We may merely advert to the speculations of Fermat, Roberval, Cavalleri, Wallis, Newton, and others as to quadrature in general—their most valuable result was the invention of the Differential and Integral Calculus by Newton, under the name of Fluxions and Fluents. Wallis, however, by an ingenious process of interpolation, showed that

$$\frac{\pi}{4} = \frac{2.4.4.6.6.8.8.10.10. \&c.}{3.3.5.5.7.7.9.9.11. \&c.}$$

which is interesting, as being the first recorded example of the determination, in a finite form, of the value of the ratio of two infinite products.

Lord Brouncker, being consulted by Wallis as to the value of the above expression, put it in the form of an infinite continued fraction, thus:

$$\frac{\pi}{4} = \frac{1}{1 + \frac{1}{2 + \frac{9}{2 + \frac{25}{2 + \frac{49}{2 + \&c.}}}}}$$

in which 2 and the squares of the odd numbers appear. This

formula has been employed to show that not only π , but its square, is incommensurable.

Perhaps the neatest of all the formulas which have been given for the quadrature of the circle, is that of James Gregory for the arc in terms of its tangent—namely,

$$\theta = \tan. \theta - \frac{1}{3} \tan. \theta^3 + \frac{1}{5} \tan. \theta^5 - \&c.$$

This was appropriated by Leibnitz, and formed perhaps the first of that audacious series of speculations from English mathematicians which have for ever dishonored the name of a man of real genius.

If we notice that, by ordinary trigonometry, the arc whose tangent is unity (the arc of 45° or) $\frac{\pi}{4}$, falls short of four times the arc

whose tangent is $\frac{1}{11}$ by an angle whose tangent is $\frac{\pi}{11}$, we may easily calculate $\frac{\pi}{4}$ to any required number of decimal places by

calculating from Gregory's formula the values of the arcs corresponding to $\frac{1}{11}$ and $\frac{\pi}{11}$ as tangents. And it is, in fact, by a slight modification of this process (which was originally devised by Machin), that π , has been obtained, by independent calculators, to 600 decimal places.

It is not yet proved, and it may not be true, that the area or circumference of a circle cannot be expressed in finite terms; if it can be, these must (of course) contain irrational quantities. The integral calculus gives, among hosts of others, the following very simple expression in terms of a definite integral:

$$\pi = \int_0^{\infty} \frac{dx}{1+x^2}$$

Now it very often happens that the value of a definite integral can be assigned, when that of the general integral cannot; and it is not impossible, so far as is yet known, that the above integral may be expressed in some such form as

$$\sqrt{x} + \sqrt{y},$$

where $\sqrt{x}$ and $\sqrt{y}$ are irrational numbers. Such an expression, if discovered, would undoubtedly be hailed as a solution of the grand problem.

But this, we need hardly say, is not the species of solution attempted by 'squares.' We could easily, from our own experience alone, give numerous instances of their helpless absurdities, but we spare the reader, and refer him, for further information on this painful yet ridiculous subject, to Prof. De Morgan's *Budget of Paradoxes*; and to the very interesting work of Montucla, *Histoire des Recherches sur la Quadrature du Cercle*.

QUADRIENNIUM UTILE, in Scotch Law, means the four years after majority during which a person is entitled to reduce or set aside any deed made to his prejudice during minority. This protection was also given by the Roman law to minors, to enable them to neutralize any unfair advantage that may have been taken of their inexperience during minority. The injury or lesion must have been caused, not by an accident, but by the imprudence or negligence, of themselves or of their curators. The proceeding, therefore, must be commenced before the minor attains 25, after which it is too late to seek restitution. See INFANT.

QUADRI'GA. See CHARIOT.

QUADRILATERAL, in Military Language, is an expression designating a combination of four fortresses, not necessarily connected together, but mutually supporting each other; and from the fact that if one be attacked, the garrisons of the others, unless carefully observed, will harass the besiegers, rendering it necessary that a very large army should be employed to turn the combined position. As a remarkable instance, and a very powerful one, may be cited the Venetian Quadrilateral (Austrian till 1866), comprising the four strong posts of Mantua, Verona, Peschiera, and Legnago. These form a sort of outwork to the bastion which the southern mountains of the Tyrol constitute, and divide the north plain of the Po into two sections by a most powerful barrier. Napoleon III., in 1859, even after the victories of Magenta and Solferino, hesitated to attack this quadrilateral.

QUADRILLE, a dance of French origin, consisting of consecutive dance movements, generally five in number, danced by couples, or sets of couples, opposite to, and at right angles to each other. The name seems to be derived from its having been originally danced by four couples.

QUADRILLE is a card game, which, as its name denotes, is played by four persons. The number of cards employed is forty, the tens, nines, and eights being discarded from the pack. The rank and order of the cards in each suit vary according as they are or are not trumps, and are different in the black and red suits.

The ace of spades, whatever suit be trumps, is always the highest trump, and is called *spadille*; the ace of clubs is always the third highest trump, and is known as *basto*; while the second highest trump, or *manille*, is the deuce of spades or clubs, or the seven of hearts or diamonds, according to the suit which is trumps, it being always of the trump suit. When the black suits are not trumps, the black cards rank as in whist; and when they are trumps, the order is the same, with the exception, as above mentioned, of the deuce, which then (in the trump suit only) becomes manille, the deuce of the black suit which is not trumps retaining its position as the lowest card. When the red suits are not trumps, the order of rank is as follows: King, queen, knave, ace, deuce, three, four, five, six, seven; but when they are trumps, the ace (of the trump suit only) is raised to the position of the fourth highest trump, under the name of *ponto* or *punto*, and the seven (of the trump suit only) becomes, as previously stated, manille. A little consideration will show, that when the black suits are trumps, the number of trump cards is eleven, and twelve when a red suit is trumps.

The three highest trumps, spadille, manille, and basto, are called *mataadores*, and the player who possesses one of them can, if he have no other trumps in his hand, decline to follow suit if trumps are led, provided the trump led is not a *mataadore* of value superior to his own. After the cards have been shuffled, cut and dealt, the elder hand, on looking at his cards, may, if his hand be weak, decline to play (or *pass*); the next player may do the same, and so on all round; in which case the elder hand must commence, naming the suit which he wishes to be trumps, and the cards are laid, and tricks taken, as in ordinary card games. If a player does not pass, but commences the game by naming trumps and playing a card, he must himself make six tricks to win; and if he succeeds he obtains the whole of the winnings; but if he loses, he pays the whole of the losses. If he commences the game by 'asking leave'—i. e., to have a partner—which is done by calling a king, the player who holds the king of the suit led must play it when his turn arrives; and he who asked leave, or *l'hombre* (in England generally called *ombre*), along with him who had the king called, or the *friend*, are from this time partners in the game, and divide either the gains or the losses, as the case may be. The *ombre* and the friend win the game if they make six tricks between them. This game is complicated by a number of conditions, which, under certain circumstances, modify the ordinary mode of playing.

A modification of this game, under the name of *preference*, is much in vogue in Lancashire; and in this country, in the beginning of last century, and on the continent—especially in France—the game of *l'hombre*, which is nothing more than quadrille played by three persons, was exceedingly fashionable. *L'hombre* is now quite obsolete, but a most accurate description of the mode in which it was played will be found in Pope's *Rape of the Lock*. *L'hombre* was the immediate predecessor of quadrille in popular favor.

QUADRIVIVUM (Lat. *quatuor*, four, and *via*, a road), the name given, in the language of the schools of the West, to the higher course of the medieval studies, from its consisting of four branches, as the lower course for an analogous reason was called TRIVIVUM (q. v.), or 'Three Roads.' The quadrivivum consisted of arithmetic, music, geometry, and astronomy. It would carry us beyond our limits to detail the nature and extent of each of these branches as pursued in the medieval schools. The reader will find much curious and new matter on all questions of this nature in the volumes of the works of Roger Bacon, lately edited in the series issued under authority of the Master of the Rolls, as also in the Introduction prefixed to the volumes.

QUADRU'MANA (Lat. four-handed), in the zoological system of Cuvier an order of *Mammalia*, which he places next after *Bimana* (q. v.), and which contains the animals most nearly resembling man in their form and anatomical characters—viz., the monkey and lemur families. The order Q., with the limits assigned to it by Cuvier, is very generally received by naturalists. The name is derived from a character, in which one most obvious difference from man is, that the extremities of all the four limbs are *hands*, or formed for grasping, and not merely those of the anterior ones; these, indeed, being in many of the monkeys less perfect hands than the hinder ones, through the want or rudimentary character of the thumb. None of the Q. are naturally adapted for an erect posture. The differences between man and the apes which most nearly approach him in form, are pointed out in the articles MONKEY, CHIMPANZEE, GORILLA, and ORANG. The Q. resemble man in their dentition more than any other animals. Their other digestive organs also exhibit a general similarity to those of man. The similarity is further apparent in the brain and in the reproductive organs; but in the *Lemurida*, a gradual departure from the human form and characters is manifested, with an approach to the ordinary quadruped type.

QUA'DRUPEDS (Lat. four-footed), a term employed both popularly and by scientific writers to designate *four-footed animals*. It is not, however, the name of a class or order in systems of zoology. Popularly, it is almost always limited to those *Mammalia* which have four limbs well developed and formed for walking, and is scarcely ever applied to the *Cetacea*, and rarely even to Seals or to the *Quadrumania* (q. v.). The full development of the limbs, with their termination in *feet* properly so called, thus appears to be by no means one of the most important characters by which groups of animals are distinguished; and this further appears when the same character is found again in great perfection, in a lower class of vertebrate animals—in Chelonian and Saurian Reptiles, as tortoises and lizards. But the *four-limbed* type prevails among vertebrate animals, from man downwards; so that even in serpents, in which it is least notable, traces of it appear on anatomical examination, as in the case of that class of large serpents named Boas (see BOA); and there are many other creatures which form connecting links as to this character between serpents and those reptiles—as crocodiles and lizards—which possess it in greatest perfection. The homology of certain fins of fishes with the limbs of quadrupeds is noticed in the article FISHES. No approach to the four-limbed type is to be found among Invertebrate animals.

QUÆSTOR (Lat. contr. from *quasitor*, a searcher or investigator, from *quæro*, to seek or search into) was anciently the title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the kings. The oldest quæstors were the *quæstores paricidii* ('trackers of murder,' ultimately public accusers), who were two in number. Their office was to conduct the prosecution of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B.C., when their functions were transferred to the *Triumviri Capitales*. But a far more important though later magistracy was the *quæstores classici*, to whom was intrusted the charge of the public treasury. The exact date of their institution cannot be ascertained, but it was subsequent to the expulsion of the kings. They appear to have derived the epithet of *classici* from their having been originally elected by the centuries. At first they were only two in number, but in 421 B.C. two more were added. Shortly after the breaking out of the first Punic War, the number was increased to eight; and as province after province was added to the Roman Republic, they amounted, in the time of Sulla, to twenty, and in the time of Cæsar to forty. On its first institution the quæstorship (*quæstura*) was open only to patricians; but after 421 B.C., plebeians also became eligible.

QUA'GGA (*Equus*—or *Asinus*—*Quagga*), an animal of the family *Equida* (q. v.), a native of the southern parts of Africa, rather smaller than the Zebra (q. v.), with the hinder parts higher, and the ears shorter; the head, mane, neck, and shoulders blackish-brown, banded with white; similar bands towards the rump, gradually becoming less distinct; a black line running along the spine. The Q. receives its name from its voice, which somewhat resembles the barking of a dog. It is more easily domesticated than the zebra, and a curdler drawn by quaggas has been seen in Hyde Park. In its wild state it does not associate with the zebra, although inhabiting the same plains. Hybrids, or mules, have been produced between the horse and quagga.

QUAIL (*Coturnia*), a genus of gallinaceous birds of the family *Tetraonida*, nearly allied to partridges, but having a more slender bill, a shorter tail, longer wings, no spur, and no red space above the eye. The first and second quills of the wing are about as long as the third, which is the longest in the more rounded wing of the partridges. Quails, therefore, far excel partridges in their power of flight. The tail is very short. They never perch on trees, but always alight on the ground. They are among the smallest of gallinaceous birds.

The COMMON Q. (*C. vulgaris* or *C. dactylisonans*) is found in most parts of Europe, Asia, and Africa. In India and other warm countries, it is a permanent resident; but in many countries it is a bird of passage; and thus it visits the north of Europe, and at certain seasons appears in vast multitudes on the coasts and islands of the Mediterranean, so that quails are there taken in hundreds of thousands in their northern and southern migrations. The Q. is not plentiful at any season in any part of Britain; but sometimes appears even in the northern parts of Scotland, and more frequently in the south of England, where it is sometimes seen even in winter. There is reason to believe that the food miraculously supplied to the Israelites in the wilderness was this very species of bird, to which the name *Selav*, used in the Mosaic narrative, seems to belong.—The Q. is fully 7 inches in entire length; of a brown color, streaked with different shades, and the wings mottled with light-brown; the throat white, with dark-brown bands in the male, and a black patch beneath the white, the lower parts yellowish-white. The Q. is polygamous. The nest is a mere hole in the ground, with 7 to 12 eggs. The Q. is highly esteemed for the table. Great numbers of quails are

brought from the continent to the London market.—Other species of *Q.* are found in different parts of Asia, although no other is so abundant as the Common *Q.*, and none migrates as it does.—The Coronamand *Q. (Q. testilis)* is a very pretty little bird, rather smaller than the Common Quail.—The Chinese *Q. (Q. excalfactoria)*, a very beautiful little species, only about 4 inches long, is abundant in China, and is there kept for fighting, the males being very pugnacious, like those of other polygamous birds, and much money is lost and won on the combats of these quails. It is also used for a singular purpose—the warming of the hands of its owner.

QUAKERS; the ordinary designation of the Society of Friends (q. v.). In respect of law, Quakers differ from the rest of their fellow-citizens chiefly as regards their marriages and their taking of oaths. Thus, though the English marriage acts required all marriages to take place in a consecrated church of the establishment, before the dissenters obtained a relaxation of the law, the Quakers' marriages were excepted, and marriages between two Quakers were allowed to be solemnized according to the usage of their own sect. As regards Quakers in the matter of taking oaths it is expressly provided by several statutes, that instead of taking an oath in the usual way, they may make an affirmation instead, whether as witness in a court of justice, or as holding a civil office, the qualification for which office is the taking of an oath. The penalties of perjury, however, attach to a false affirmation in the same way as to a false oath. With regards to church-rates, it had been decided that Quakers stand on the same footing as other people in respect of their liability to pay church-rates; but compulsory church-rates are now for the most part abolished.

QUAKING-GRASS (*Briza*), a genus of grasses, having a loose panicle; drooping spikelets, generally remarkable for their broad and compressed form, suspended by most delicate footstalks, and tremulous in every breath of wind; the spikelets with two glumes and numerous florets, the florets having each two awnless paleæ, which become incorporated with the seed. The species are few,

Quaking Grass (*Briza media*).

and mostly European. They are all very beautiful. *B. maxima*, a native of the south of Europe, is often planted in flower-gardens. *B. media*, the only species common in Britain, growing in almost all kinds of poor soil, from the sea-coast to an elevation of 1500 feet, is of some value as pasture-grass, being very nutritious, although the quantity of herbage is scanty.

The value of many poor pastures very much depends on it; but when they are enriched by manures, it generally disappears. It is sometimes sown by farmers, but not nearly to such an extent as it would be if its seed did not lose vitality so quickly that only a small proportion grows, if it is not sown in autumn when newly ripened.

QUAMASH, or BISCUIT ROOT (*Camassia esculenta*), a plant of the natural order *Liliaceæ*, nearly allied to squills and hyacinths. It is a North American plant, abounding on the great prairies west of the Mississippi. The roasted bulbs are agreeable and nutritious, and are much used as an article of food.

QUANG-NAM, KUANG-NAM, or TURON, a town of Anam, about 75 miles south-east-by-east from Hué (q. v.), or Phu-thuan-rihen, the capital of Anam. It is situated near the head of a beautiful gulf, and is a place of considerable trade.

QUANTIFICATION OF THE PREDICATE, a phrase belonging to Logic, and introduced by Sir W. Hamilton to express the characteristic feature of certain logical doctrines of his respecting the Proposition and the Syllogism.

According to the Aristotelian Logic, propositions are divided, according to their *quality*, into affirmative and negative ('The sun has set,' 'The sun has not set'); and, according to their *QUANTITY*, into universal and particular ('All men are mortal,' 'Some men live eighty years'). If we combine the two divisions, we obtain four kinds of propositions—Affirmative Universal ('All men are mortal'), Affirmative Particular ('Some men live to eighty'), Negative Universal ('No men are omnipotent'), Negative Particular ('Some men are not wise').

Now, it is remarked by Sir W. Hamilton, that the statement of the *QUANTITY* of these various propositions is left incomplete; only the *subject* of each has its quantity expressed (*all men, some men, no men*); while there is implied or understood in every case a certain quantity of the *predicate*. Thus, 'All men are mortal,' is not fully stated; the meaning is, that all men are a *part* of mortal things, there being (possibly and probably) other mortal things besides men. Let this meaning be expressed, and we have a complete proposition to this effect: 'All men are *some* (or *part* of) mortals,' where quantity is assigned, not only to the subject, but also to the predicate. It might be that the predicate contained under it only the subject, as in the proposition: 'All matter gravitates.' There is no other thing in the universe except matter that obeys the law of gravitation. Knowing this, we might quantify the predicate accordingly: 'All matter is *all* gravitating things,' a kind of proposition not recognized in the old logic. Another original form of proposition, brought out by supplying the quantity of the predicate, is 'Some A is all B'; 'Some men are all Englishmen.' So that, instead of two kinds of propositions under affirmation, Sir W. Hamilton's system gives four. In the same way, he increases the number of negative propositions. 1. For 'No man is omnipotent,' he writes, quantifying the predicate, 'Any man is not *any* omnipotent'; or, 'All men are out of *all* omnipotent things.' 2. 'Some men are not young' is fully quantified; 'Some men are not *any* young things'; 'Some men are out of *all* young things.' These two (in their unquantified shape) are the ordinarily recognized propositions of the negative class. To them Sir W. Hamilton adds—3. 'All men are not *some* animals,' 'All men are excluded from a certain division of the class animal'; and 4. 'Some animals are not *some* men,' 'A portion of the animals is not included in a portion of men.'

The first result, therefore, of completing the statement of a proposition by inserting what Hamilton considers as implied in the thought—namely, the quantity of the predicate—is to give eight kinds of propositions instead of four. The next result is to modify the process called the Conversion of Propositions. See CONVERSE. The kind of conversion called *limitation* (All A is B, *some* B is A) is resolved into simple conversion, or mere transposition of premises without further change. 'All A is *some* B;' 'Some B is all A.'

The multiplication of varieties of propositions is attended with the further consequence of greatly increasing the number of *sylogisms*, or forms of deductive reasoning. See SYLLOGISM. In the scholastic logic, as usually expounded, there are nineteen such forms, distributed under four figures (four in the first, four in the second, six in the third, five in the fourth). By ringing the changes on eight sorts of propositions, instead of the old number, four, *thirty-six* valid syllogisms can be formed in the first figure. Whether the increase serves any practical object, is another question.

Sir W. Hamilton also considers that he has been led, by the new system, to a simplification of the fundamental laws of the syllogism, or, as he expresses it, 'the reduction of all the *General Laws of Categorical Syllogisms* to a *Single Canon*.'

Professor De Morgan, in his elaborate system of *Formal Logic*, has also invented and carried out into great detail a plan of expressing the quantity of the predicate; but he does not admit the whole of Hamilton's eight propositional forms, rejecting in particular the last mentioned in the above enumeration. He also increases the number of valid syllogisms as compared with the old logic. Not content with indicating that the predicate has quantity as well as the subject, he supposes the possibility of a *numerical estimate* of quantity in both terms of the proposition, and from this draws a new set of inferences. Thus, if 60 per cent. of B are included in C, and 70 per cent. in A, 30 per cent. at least of B must be found both in A and in C.—See Sir W. Hamilton's *Discussions*; Spencer Baynes's *New Analytic of Logical Forms*; De Morgan's *Formal Logic*; Mill's *Logic*, under the Syllogism; and his *Examination of Sir W. Hamilton's Philosophy*.

QUAQUAVE'RSAL (Lat. turning every way), a term applied in Geology to the dip of the Stratified rocks when arranged in dome-shaped elevations, or basin-shaped depressions, whereby the beds have an inclination on all sides to one point, that point

being the summit of the dome in the one case, and the lowest level of the basin in the other.

QUARANTINE (from the Fr. *quarantaine*, a period of 40 days) is a forced abstinence from communication with the shore, which ships are compelled to undergo when they are last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, are or have been raging. Where a quarantine is established, it is a high misdemeanor for any person in the suspected ship to come on shore, or for any one to disembark any merchandise or goods from her. The countries on the eastern and southern shores of the Mediterranean are those most commonly held to be infectious, and, as a regular arrangement, ships from them have to pass quarantine at Malta, or some French, Italian, or Spanish port. In England, the quarantine laws were, until about 20 years ago, enforced with severity; but now a quarantine is an unusual occurrence, although the power to enact it rests with the crown, and it is occasionally imposed by an order in Council. In Mediterranean ports, quarantine ordinarily lasts from 6 to 15 days, though it sometimes extends to a much longer period, during which the passengers are imprisoned in a sort of barrack called a 'lazaretto,' and the contents of the ship—animals, goods, and letters—are fumigated, punctured, sometimes immersed in water, or even acid, and all possible means are adopted to destroy infection.

Quarantine is not of necessity limited to a sea-frontier; and it is enforced—often with absurd rigor—at the frontiers between contiguous states, especially in Eastern Europe, to the annoyance of travelers, and to the serious detriment of commerce.

History declares quarantine regulations for maritime intercourse to have been first established by the Venetians in 1287 A.D.; but the practice must have been greatly older on land-frontiers; and the precautions of the Jews against leprosy indicate that a species of quarantine was enforced by them. The law for regulating quarantine, when imposed in England, is 6 Geo. IV. c. 78.

QUARRE L'IMPEDIT is the title of an English action, whereby a person who has purchased an advowson, or right of presentation to an ecclesiastical benefice, sues any one who disturbs or hinders him in the exercise of his legal right.

QUARREL, or **QUARRY**, a pane of glass of a lozenge or diamond shape. The name is also applied to a perforation or window of this form, and to square or diamond-shaped paving-stones or tiles.

QUARRY (Fr. *carrière*). When any useful rock is worked in an open manner at the surface of the earth, the excavation is called a quarry. Quarrying differs little from mining in principle, except that the latter is essentially an underground operation.

From a very remote period, famous granite quarries have been worked at Syene, and others of sandstone and limestone, along the banks of the Nile, for the temples and monuments of ancient Egypt. Greece found the materials for her white marble temples in the quarries of Mount Pentelicus, near Athens, and in those of the islands of the Archipelago. It was from the quarries of Travertine (a kind of limestone), at Tibur, that ancient Rome was chiefly built. Italy has long been celebrated for her marble quarries, those of Tuscany yielding the most esteemed kinds. The fine saccharoid marbles for statuary and other fine-art purposes, are exclusively obtained from the Apuan Alps, which rise around Carrara, Massa, and Seravezza. Those of Carrara, especially, are highly prized all over the world. From the quarries at Seravezza, marble to the value of £150,000 has been taken for the splendid cathedral of St. Isaac at St. Petersburg alone.

Of the more celebrated quarries of the British Islands, we may mention those of Cornwall, Aberdeen, and Wicklow for granite; those in the neighborhood of Edinburgh, Glasgow, and Newcastle, for sandstone; those near Bristol and Doncaster, and in the Isle of Portland, for limestone; those of Derbyshire, Devonshire, Kilkenny, and Galway, for marbles; and those of North Wales and Argyshire for slates.

To understand the operations of the quarryman, it is necessary to bear in mind that all rocks belong to one or other of two great classes, namely, the stratified and the unstratified. The former are sedimentary rocks, occurring in parallel beds or strata, and consist chiefly, in so far as we are at present concerned, of sandstone and limestone. Unstratified or igneous rocks, which include greenstone or whinstone, granite, porphyry, &c., have no distinct bedding, that is, they do not lie in separate layers. Roofing-slate is a stratified rock, but it splits into thinner laminae in the direction of its *cleavage* than in the direction of its bedding, the former being often at right angles to the latter. Granite and other igneous rocks have also a natural jointage or cleavage, although they are not stratified. Advantage is taken of these peculiarities in quarrying the different rocks, but in the main the systems adopted do not greatly differ.

Stones are most frequently separated from their native rock by blasting with gunpowder. This operation is described in detail

under **BLASTING**; see also **GALVANISM** and **SAFETY-FUSE**. Of late the practice of boring jumper-holes with engine-power has been introduced, and wherever it can be conveniently applied, must be a great improvement on the slow and tedious process of boring by hand. See **TUNNEL**.

With some stratified rocks, such as sandstone, a good many of the best stones are procured without the aid of gunpowder. Hand-tools are alone used, because blasting is apt to cause rents, and otherwise shatter portions which it is desirable to keep solid. By this method, the quarryman makes a number of small holes with a pick, along a certain length of rock, into which steel wedges are inserted. After a succession of blows with heavy hammers, the wedges at length cut through the stratum. Blocks for columns, obelisks, tombstones, &c., are best procured in this way. It may also be stated that these are obtained from those more valuable parts of sandstone deposits technically termed 'liver rock,' which consist of the thicker and more consolidated strata. Flagstones and other pieces of limited thickness are quarried from the thinner beds termed 'bed rock.'

When stones are removed in masses by blasting or otherwise they have still to be quarried into shape, according to the purpose for which the various pieces are best suited. Thus in an ordinary building-stone quarry, the larger stones (after those of unusual size and quality are selected for the purposes named above) are roughly formed into ashlar, window-sills, lintels, rybats, corners, steps, and the like, by means of such tools as picks, hammers of various kinds, and wedges. The small irregular-shaped pieces are called *rubble*, and are used for the commonest kind of building. Slates are split up into the thickness used for roofing, by means of a mallet and broad chisel. In granite quarries worked for paving-stones, as has been incidentally alluded to above, the loss of material in reducing the blocks to the size and shape required, is enormous, as much as four-fifths of the whole being commonly wasted.

Besides the tools already mentioned, long iron bars called *pinches*, and powerful cranes for turning and lifting the larger stones, are nearly all the implements required by the quarryman.

In quarrying, as well as in mining, much of the cost is incurred for the pumping of water from the workings. A good steam-engine and set of pumps are therefore indispensable for every quarry of any extent. Much expense is also every now and then incurred in clearing away sand, gravel, and other loose débris from the upper bed of the rock. This, which is called 'drift' by geologists, and 'tiring' in some localities by quarrymen, often becomes suddenly very deep, especially where the beds dip at a high angle, and is an obstacle by which many quarries of stratified rock are sooner or later arrested.

QUARRIES, in point of law, belong to the person who is owner of the freehold or inheritance of the land, the maxim being, that the owner is entitled to the soil down to the center of the earth. No person, therefore, is entitled to work a quarry or carry away the materials unless he derives his right from the owner by lease or other legal title, for the stones and materials are part of the soil, and belong to the freeholder.

QUART, a measure of capacity, and the fourth part of a Gallon (q. v.). The word is nothing more than the common word 'quarter,' a fourth part. The ordinary *quart-bottle* is a deception, containing only the sixth part of a gallon, and often less.

QUARTAN FEVER. See **AGUE**.

QUARTER, the name of two measures in use throughout the United Kingdom, one of them a measure of weight, and the other of capacity. The former is denominated a quarter from its being the fourth part of a hundredweight, and contains 28 lbs. avoirdupois; the capacity measure of the same name is said by some to have been so called from its being the fourth part of a 'chaldron,' but, as it happens, the quarter does not always bear this relation to the chaldron. As the porphyry coffer in the King's Chamber of the Great Pyramid (see **PYRAMID**) is said to be almost accurately the quadruple of the English quarter, the bold theory has been advanced that this is the origin of the measure and the name (see *Our Inheritance in the Great Pyramid*, by Piazza Smyth). The quarter contains 8 bushels, of 4 pecks each. See **BUSHEL**.

QUARTER, in Heraldry, a subsidiary consisting of the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the center of the shield. When two or more coats are marshalled together on a shield divided into squares for their reception, such divisions are also called quarters. See **QUARTERING**.

QUARTER, in War, signifies the sparing of the life of a vanquished enemy, which by the laws of war is forfeit to the victor. The expression seems to be derived from the use of the word 'quarter' to designate the lodging of the particular warrior; to *give quarter* to a prisoner being to send him to his captor's quarter for liberation, ransom, or slavery. The refusal of quarter is a

terrible aggravation of the horrors of war, and is only at all justifiable towards an enemy who has been guilty of atrocious cruelty himself or of some flagrant breach of faith.

On shipboard, a quarter is the stern portion of each of the ship's sides. The extent of the quarter is arbitrary, but it is generally held to comprise about one-fifth of the ship's length.

QUARTER-DAYS are the days adopted between landlord and tenant for entering or quitting lands or houses and for paying rent. The origin of these periods is no doubt due entirely to convenience, and though in England they are unknown to the common law, yet now they are almost part and parcel of every agreement made between parties as to the letting of houses and land. In England, if nothing is said as to the time of payment of rent, it is due only once a year, and the first payment is due at the end of a year from the time of entry. But owing to the convenience of the usual quarter-days, they are commonly referred to, and thereby imported into the contract. Thus, it is usual to enter and leave houses either at one of the four ordinary quarter-days, or where it is so arranged at half-quarter-days, and these points of time are fixed upon for the convenience of calculating rent. Rent of houses is generally made payable quarterly on the usual quarter-days. These are, in England and Ireland, Lady Day, March 25; Midsummer Day, June 24; Michaelmas Day, September 29; and Christmas Day, December 25.

In Scotland, there are what are called two legal terms in each year, and two conventional terms, the latter being only adopted when expressly so agreed. The legal terms are Whitsunday, May 15, and Martinmas, November 11; and the conventional terms are Candlemas, February 2, and Lammas, August 1. (Since 1881, the *removal* terms for houses in burghs in Scotland are fixed for the 28th May and 28th November.) In Scotland, if nothing is said between the parties on letting houses and lands, these legal terms are implied in the agreement, both as regards time of entry and payment of rent. Thus, as to houses and grass-lands, the legal term of entry is Whitsunday, and that of entry to arable land is Martinmas. So the rent is presumed to be payable twice a year at those legal terms.

QUARTER-DECK of a ship is an upper deck extending from the main-mast to the poop, or, when there is no poop, from the main-mast to the stern. It is used as a promenade by the officers only, and, in a ship-of-war, no person—officer or otherwise—enters upon it without touching his hat in token of salute. When the captain addresses his men, or confers public distinction on any individual, the crew are summoned aft on the quarter-deck.

QUARTERING, in Heraldry, is the bearing of two or more coats on a shield divided by horizontal and perpendicular lines, a practice not to be found in the earlier heraldry, and little in use till the 15th century. Arms may be quartered for various reasons. 1. To indicate dominion. A sovereign quarters the ensigns of his different states. The earliest instance of quartering in England is found in the paternal arms of Eleanor, daughter of Frederick III., king of Castile and Leon, and first wife of Edward I., as represented on her tomb in Westminster Abbey—the castle of Castile occupying the first and fourth quarters, and the lion of Leon the second and third. The arms of England and Anjou are similarly quartered on the same monument, and on the crosses erected to Queen Eleanor's memory. The received rule regarding the quartering of the ensigns of different states is, that precedence is given to the most ancient, unless it be inferior in importance. Feudal arms are sometimes quartered in the same way by subjects. 2. Arms of augmentation or special concession accorded to a subject by his sovereign, by way of honor, are sometimes granted to be borne quarterly with the paternal arms. These generally contain a portion of the royal insignia, and have precedence of the paternal coat. 3. The most usual reason for quartering is to indicate descent from an heiress who has intermarried into the family. Where there is but one heiress, her coat occupies the second and third quarter of the shield, and the paternal arms the first and fourth. Where there are more than one, they are marshalled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshalled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters. Where there is an odd number of coats, the last quarter is usually filled up by repeating the first.

One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat; the shield is then said to be counter-quartered, and its primary quarters are called *grand quarters*. Quarterings are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

The expression 'quarterings' is often loosely used for *descents* in cases where there is no right to quarter from representation. The eight or sixteen quarterings which are sometimes ranged round the Scottish funeral escutcheon, and which are still important for many purposes in Germany, have no reference to representation, but imply purity of blood for four or five generations;

i. e., that the father and mother, the two grandmothers, and four great-grandmothers, as also in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armour.

QUARTERMASTER. In the Army, the *quartermaster-general* is a staff-officer of high rank, whose duty it is to arrange the marches, quarters, and internal arrangements of the army to which he belongs. Every army has some officer of this department; from a brigade with a deputy-assistant-quartermaster-general, receiving £173, 7s. 6d. a year besides regimental pay, up to a complete army under a commander-in-chief, with a quartermaster-general, who is usually a general officer, and receives £691, 19s. 7d. per annum, besides his other pay. At headquarters, there is a permanent quartermaster-general, responsible for all the movements of the army, the organization of expeditions, camps of instruction, &c. He receives £1500, besides his pay as a general officer, and has a sub-department at the War-office, with clerks, &c. He is under the officer commanding in chief, and the adjutant-general.

The *quartermaster* is an officer on the staff of each regiment, in which he holds the relative rank of lieutenant. His duties are to superintend, assign to their respective occupants, and have charge of, quarters, barracks, tents, clothing, &c., used by the regiment. He is also regimental storekeeper. He rises, with scarcely an exception, from the ranks, the experience of an old sergeant being considered highly useful in the office. The quartermaster has no further promotion to look forward to; but after 80 years' service in all—including 10 as an officer—he may retire with the honorary rank of captain. He receives 10s. 2d. a day in the cavalry, and 8s. 2d. in the infantry, rising by length of service to 15s. 2d. and 13s. 2d.; with slightly different rates in the Guards, Engineers, &c. He is not required to join the mess. The *quartermaster-sergeant* is a non-commissioned officer appointed to assist the quartermaster in his various duties. He receives daily 4s. 5d. in the cavalry, 4s. in the artillery, 2s. 11d. in the infantry of the line.

In the Navy, the *quartermasters* are certain petty officers appointed in each ship by the captain to have charge of the stowage of ballast and provisions, of coiling ropes, attending to the steering, keeping time by the sand-glasses, &c. The principal of these men is called the ship's quartermaster, and receives £41, 1s. 3d. per annum, if engaged for continuous service; £86, 10s., if otherwise.

QUARTER is a term frequently employed in some parts of Great Britain to designate the fourth part of a peck; and in liquid measure, it is the fourth part of a pint, and is synonymous with the imperial gill.

QUARTERS, in Naval and Military affairs, are, generally, the positions assigned to persons or bodies of men. In a more special sense, the quarters in the army are the places of lodging assigned to officers or men, when not actually on duty. *Head-quarters* is the quarter of the commanding officer of a force, or of a section of a force. The head-quarters of the whole British army is at the Horse Guards, where the commander-in-chief has his permanent offices.

In the Navy, quarters has the special meaning of the positions to be taken by every man in actual combat.

QUARTERS, the upright posts of timber-partitions, &c., used for lathing upon. They do not exceed 4 inches square, and are generally about 4½ inches by 2 inches, and are placed from 12 to 14 inches apart.

QUARTER SESSIONS, in England, is a court or meeting of justices of the peace, who assemble every quarter of the year, for judicial as well as miscellaneous business. The meetings are fixed by statute to be held in the first full week after December 28, March 31, June 24, and October 11, respectively; often otherwise called the Epiphany, Easter, Trinity, and Michaelmas Sessions. The chief officer of the Court of Quarter Sessions is the *custos rotulorum*, so called because he is intrusted with the custody of the records and rolls. He is always one of the justices of the peace of the county or riding, nominated by the crown, and appointed by the commission. His deputy is the clerk of the peace, who acts also as clerk to the Court of Quarter Sessions.

The jurisdiction of the Court of Quarter Sessions is confined to criminal business, and is very important. It includes all criminal offences whatever, except the highest classes; thus, it has no jurisdiction to try for treason, murder, or capital felony, or blasphemy, perjury, forgery, arson, bigamy, abduction of women or girls, concealment of birth, offences against the Queen's title or the bankrupt laws, bribery, blasphemous, seditious, or defamatory libels, unlawful combinations or conspiracies, stealing or destroying wills or records. Besides its jurisdiction in criminal offences, there are numerous miscellaneous matters of which the Court has cognizance, including appeals from petty sessions, and from justices in special sessions, on a great variety of subjects, as to convictions of vagrants, stopping up highways, removal of

paupers, &c. The justices who do the work of Quarter Sessions are all unpaid, and thus save the country much expense. They generally choose a chairman of their own body to preside regularly at these courts, which office is considered a great honor, and is generally given to an able practical man, well versed in business.

This plan, however, of unpaid judges has been found inexpedient in boroughs and large towns, where the justices of the peace, being appointed chiefly from successful tradesmen, are not possessed of the necessary education to secure the efficient performance of like duties. There is therefore appointed for every borough in England a Recorder, who is a barrister, appointed by the Home Secretary, and is paid by salary out of the borough fund—a salary, however, very trifling in amount. His duty is confined to trying prisoners and other judicial business, and he is in fact, in his own person, the Court of Quarter Sessions for boroughs. There is also an exception to unpaid judges of Quarter Sessions in the county of Middlesex, where a barrister is appointed to act in the trial of prisoners, and called the assistant judge, being the official chairman of the Middlesex Sessions. The routine of business at Quarter Sessions consists of the trial of offenders, the trial of appeals, and the hearing of motions upon different subjects. Sometimes a second court sits, consisting of some of the justices appointed by the whole court, whenever the business is unusually heavy. In Scotland, there is also a Court of Quarter Sessions of the peace, held four times a year at the county town—viz., on the first Tuesdays in May, August, and March, and the last Tuesday in October. At these courts, the justices have power to review the sentences of special and petty sessions. But these courts are of a trifling description compared to the courts of the same name in England. In Scotland, the judicial business which in England devolves on Courts of Quarter Sessions, is chiefly disposed of by the sheriff of the county.

QUARTER-STAFF, formerly a favorite weapon with the English for hand-to-hand encounters, was a stout pole of heavy wood, about 6½ feet long, shod with iron at both ends. It was grasped in the middle by one hand, and the attack was made by giving it a rapid circular motion, which brought the loaded ends on the adversary at unexpected points.

QUARTETT, a piece of music arranged for four voices or instruments, in which all the parts are *obligati*, i. e., no one can be omitted without injuring the proper effect of the composition. Vocal quartetts are generally accompanied by instruments to sustain the voices. A mere interchange of melody, by which the parts become in turn principal and subordinate, without any interweaving of them, does not constitute a quartett. Quartetts for stringed instruments are generally arranged for two violins, a tenor violin, and violoncello. The most important quartetts have been composed by Haydn, Mozart, Beethoven, Spohr, and Onslow.

QUARTILE. See ASPECTS.

QUARTO-DE-CIMANS, those who, after the final decision of the Council of Niceæ, continued to hold that it was obligatory on Christians to celebrate Easter on the 14th day of the first lunar month near the vernal equinox, *whether that 14th day fell on Sunday or not*, or who, even before the Council of Niceæ, held the observance of the Jewish Passover to be of obligation. The controversies as to the celebration of Easter have been briefly described under the head EASTER (q. v.).

QUARTZ, a mineral, which is essentially *Silicic Acid*, or *Oxide of Silicon* (see SILICON), although it is often combined or mixed with other substances. It is a very abundant and widely-diffused mineral. It is almost the sole constituent of quartz rock, in which gold is far more frequently found than in any other matrix; and it is a principal constituent of granite, syenite, protogine, eurite, pegmatite, granulite, elvanite, all the different kinds of sandstone, and many other rocks. It is also a common mineral in trap-rocks, limestone, &c., and the sands of the sea-shore and of deserts are chiefly formed of it. It is found both massive and crystallized; the primary form of the crystals is a rhomboid, but it far more frequently occurs in six-sided prisms, terminated by six-sided pyramids; or in six-sided pyramids; or sometimes in dodecahedrons, formed by six-sided pyramids base to base. It is hard enough to scratch glass easily, and it gives fire with steel. It becomes positively electrical by friction; and two pieces, rubbed together, give light in the dark. When pure, it is quite colorless; but, owing to the presence of foreign substances, it often exhibits great variety of colors; and many minerals, known by different names, and consisting chiefly of quartz, have little or nothing to distinguish them but their color. Thus Rock Crystal, Chalcedony, Carnelian, Cairngorm, Agate, Amethyst, Prase, Chrysoprase, Jasper, &c., are mere varieties of quartz. Opal (q. v.) is very nearly allied to it.

Quartz Rock, or Quartzite, is a sedimentary sandstone, converted into a very hard, compact rock by metamorphic action. It is distinctly granular; the grains, however, seem to melt into each

other, or to be enveloped in a homogeneous silicious paste. It is frequently brittle, and in weathering, it breaks up into small irregular cubes.

Quartz veins, occur in metamorphic rocks. The structure of the veins is compact and homogeneous, and very different from that of quartzite. Veins not only differ in width, but the same vein is very variable throughout its course, sometimes thinning to a very fine film, and then swelling out to great thicknesses. Quartz veins are more metalliferous than the mass of the rocks in which they occur. They are the principal natural repositories of gold, for though the precious metal is chiefly obtained from alluvial sands and gravels, these are the weathered and abraded fragments of the underlying, or neighboring Paleozoic rocks. Small quantities of gold have been found in the quartz veins traversing the Silurian and Cambrian rocks of Wales and Scotland; and in Victoria, the great veins are so highly auriferous, that they are mined for the precious metal. Wherever the Lower Silurian rocks make their appearance on the surface throughout the colony, they are everywhere intersected by enormous numbers of quartz veins, which often reach a thickness of 10 to 15 feet. As yet, only a very small proportion of those have been explored; but the results have been so remunerative, that mining in the solid rock for gold is extensively pursued. One mine has been driven to a depth of 400 feet, and, contrary to the generally-received opinion, the vein at this depth continued to be auriferous.

QUASIMODO SUNDAY, called also DOMINICA IN ALBIS, the first Sunday after Easter. The name Q. S. is taken from the first words of the Introit (1 Peter, ii. 2) of the mass of the day. The name *Dominica in Albis* is derived from the custom which was formerly observed of the neophytes who had been baptized at Easter appearing in white garments in the church.

QUASS, a sort of weak beer produced in Russia by fermenting rye-meal in warm water. It is usually bottled in stone bottles, and is a favorite beverage with the people generally. When it becomes too sour, it is used as vinegar.

QUASSIA, a genus of trees and shrubs of the natural order *Simarubaceæ* (q. v.); having hermaphrodite flowers, with five petals combined into a tube, and much longer than the small calyx, ten stamens, five germens, and only one style; the fruit composed of five drupes. *Q. amara* is a native of the tropical parts of America, and of some of the West India Islands. It is a shrub of 10–15 feet high, with racemes of bright-red flowers, and large pinnate leaves, the stalks of which are remarkably winged and jointed. The wood, and particularly that of the root, has a very strong bitter taste, and was at one time much used in medicine under the names of *Q-wood*, *Bitterwood*, &c. The flowers were valued in Surinam for their stomachic properties, as early as the beginning of the 18th c.; the wood of the root began to be known in Europe before the middle of that century, and was more fully brought into notice about 1756, by Rolander, a Swede, who had visited Surinam, and had learned its value from a negro, called Quassi, or Quasha. This negro had employed it with great success as a remedy for fevers, and although, as Rolander says, a very simple man, had acquired a great reputation by his use of it.

Linnæus published a dissertation on it in 1763, and it was he who gave to the genus the name Quassia, from the name of the slave by whom its medicinal qualities had been made known. The true Q. is now, however, little used; its name having been transferred to the Bitterwood (q. v.) of the West Indies *Picræna* (or *Simaruba*) *excelsa*, a lofty tree, the wood of which possesses the same properties, although in an inferior degree; but this inferiority is compensated by the greater facility with which any requisite supply is obtained. It is the wood of this tree which is now sold as *Q-wood*, or *Q-chips*, in the shops. It is used to a considerable extent instead of hops for making beer, although the use of it is illegal in Britain, and beer made with it is said to become muddy and flat, and not to keep. *Q-wood* is narcotic, and a decoction of it is used for killing flies. Cabinet-work made of it is safe from all attacks of insects. In medicine, it is a valuable tonic; but in fevers, it is not to be compared with Peruvian bark and its alkaloids. Its properties depend chiefly on a bitter principle, called *Quassite* or *Quassin*.

QUATERNARY, a term employed by some French and English geologists to characterize the Post-tertiary strata, which they group together into an epoch of equal value with the three great divisions of Primary, Secondary, and Tertiary. The deposits included under the name will be found described under the Pleistocene and Recent strata, to which we refer the reader.

QUATERNIONS, the name given by its inventor, Sir W. R. Hamilton (q. v.), to one of the most remarkable of the mathematical methods or calculi, which have so enormously extended the range of analysis, while simplifying its application to the most formidable problems in geometry and physics.

It would be inconsistent with our plan to give even a complete

though elementary analytical view of this calculus; but it is possible, by means of elementary geometry and algebra alone, to give the reader a notion of its nature and value.

For this purpose, it will be necessary to consider some very simple, but important, ideas with reference to the *relative position* of points in space. Suppose A and B to be any two stations, one, for instance, at the top of a mountain, the other at the bottom of a coal-pit. *Upon how many distinct numbers does their relative position depend?* This can be easily answered thus: B is so many degrees of longitude to the east or west of A, so many degrees of latitude to the north or south of A, and so many feet above or below the level of A. **THREE** numbers suffice, according to this mode of viewing the question, to determine the position of B when that of A is given. Looking at it from another point of view, suppose A to be the earth, B a fixed star. To point a telescope at B, we require to know its altitude and azimuth, its latitude and longitude, or its right ascension and declination. Any of these pairs of numbers will give us the *direction* of the line AB, but to determine absolutely the position of B, we require a *third* number—viz., the length of AB. Hence, it appears that any given line AB, of definite length and direction, is completely determined by *three* numbers. Also, if the line *ab* be parallel and equal to AB, it evidently depends on the same three numbers. Hence, if we take the expression (AB) to denote (not as in geometry, the length of AB merely, but) the length and direction of AB; we see that there will be no error introduced, if we use it in the following sense:

$$A + (AB) = B;$$

i. e., if, beginning with A, we take the step represented by (AB), we shall find ourselves at B. From this it follows at once that, if C be any third point,

$$A + (AB) + (BC) = C;$$

i. e., beginning at A, and taking the successive steps (AB) and (BC), we are finally brought to C. But we have also

$$A + (AC) = C,$$

by taking the step from A to C at once. Hence, with the present signification of (AB) &c., we see that

$$(AB) + (BC) = (AC),$$

which shows that lines, *when their length and direction are both considered*, are to be added or compounded according to the same law as velocities or forces. See COMPOSITION OF FORCES. In this sense, a line is called by Sir W. R. Hamilton a *Vector*.

Again, we have evidently

$$A + (AB) + (BC) + (CA) = A,$$

because the three successive steps bring us back to the starting-point. Hence

$$(AB) + (BC) = -(CA),$$

and therefore (AC) = -(CA), or the sign (only) of a vector is changed if its direction be reversed.

The rules for the addition, and therefore for the subtraction of vectors are thus extremely simple; and without any further preface, we are in a position to solve a great many geometrical problems, some of which are of no common difficulty. A comparatively simple one must suffice; let us prove Euclid I., 33; i. e., if AB be parallel and equal to CD, AC is parallel and equal to BD. In vectors, given (AB) = (CD), prove (AC) = (BD). We have at once, by going directly from A to C, and then by the course A, B, D, C,

$$(AC) = (AB) + (BD) + (DC).$$

But (AB) = (CD) = -(DC) by what we have just proved. Hence the first and third terms of the expression for (AC) are equal and of opposite signs, and therefore

$$(AC) = (BD).$$

This example has been chosen from its simplicity, and gives an extremely inadequate idea of the grasp which vectors take in common geometry.

So far, we have not advanced much beyond common geometrical methods; but we *now* come to the step in which quaternions proper are introduced, a vector being merely a degraded species of quaternion. This new step contains Hamilton's answer to the question, answered over and over again during the last fifty years in forms of the most uncountable complexity, 'How to express the product, or the quotient of two vectors, or directed lines.' In other words, keeping to one part of the question only, what is the nature of the factor *q* in the equation

$$(AC) = q(AB),$$

where A, B, C are any three points?

Let us first consider *on how many independent numbers does it depend?* It might at first sight appear to depend on *six*, for (AB)

and (AC), as we have already seen, each contain *three*. But let us analyze the process of passing from the one vector to the other, much as we have already analyzed the vector step of passing from one point to another. To simplify the idea of the process, let us suppose it to be effected by a species of rotation. First, then, in order that (AB) may be turned so as to coincide in *direction* with (AC), it must be turned about an axis perpendicular to the plane of the triangle ABC, and through an angle BAC. Now, the

direction of a line depends on *two* numbers, as we have seen above; hence we have *two* for the direction of the axis, and *one* for the angle through which AB is turned. But AB and AC are not, in general, of equal length; hence, after their directions have by turning been made coincident, AB must be compressed or stretched till its length is the same as that of AC. Thus, a *fourth* number is required for the complete description of the process, and therefore *q* depends upon *four independent numerical quantities*; hence its name, quaternion. A similar investigation, but somewhat less elementary, shows that the *product* of two vectors also depends on four distinct numbers. This will be proved analytically further on in the article.

Now, suppose AB and AC to be *equal* to each other, and at right angles; and suppose

$$q(AB) = (AC);$$

i. e., suppose that *q* turns AB through a right angle in a given plane, without altering its length. Apply the operation, denoted by *q*, a second time, and we have

$$q \cdot q \cdot (AB) = q(AC).$$

Now *q*(AC) must represent a vector equal to AC in length, but turned through a right angle in the plane BAC. It must therefore be in the direction of BA produced through A, and equal in length to AB. Hence, by a previous remark, it may be expressed by

$$-(AB), \text{ or by } (BA).$$

Hence, $q \cdot q(AB) = -(AB)$, or $q \cdot q = -1$.

The particular quaternion, therefore, which turns a vector through 90° without altering its length, has its square equal to -1. Though, of course, they are essentially a real geometrical conception, this result shows how closely quaternions are connected with what are called Imaginary Quantities (*q. v.*) in analytical geometry and algebra.

Now, it is found, by a careful examination of all the consequences involved, that we are at liberty to represent by a vector of unit length, perpendicular to the plane of two equal lines at right angles to each other, the quaternion which, employed as a multiplier, changes one of these lines into the other. This result we must assume; as its proof, though not in any sense difficult, would require the free use of analytical symbols to condense it within our assigned limits. Hence, three vectors, each of unit length, and each perpendicular to the other two, have the property that the product of any two, taken in the proper order, is the third. For illustration, suppose these to be drawn eastwards, northwards, and upwards, and let them be represented (according to Hamilton's notation) by *i, j, k* respectively; we have the following equations among them:

$$i \cdot j = k, \quad j \cdot k = i, \quad k \cdot i = j;$$

where it is to be observed that the *order* of the alphabet is maintained throughout. Also, as before, we see that $i^2 = j^2 = k^2 = -1$.

Considering them, for a moment, as handles to be laid hold of to turn the whole system about one of them, we see that *i* turns *j* into the position of *k*; that is, the operation *i* may be effected by a left-handed quadrantal rotation about the eastward line *i*. What, then, is the result, upon the vector *i*, of the rotation symbolized by *j*? Laying hold of the northward line *j*, use it as an axis of left-handed quadrantal rotation, and the effect on the system will be not only (as above, $j \cdot k = i$) to make the upward line an eastward one, but to make the eastward line a *downward* one; in symbols,

$$j \cdot i = -k.$$

Comparing this with

$$i \cdot j = k,$$

we see that in quaternions, the *Commutative Law of Multiplication* does not hold; i. e., that the product depends not only on the factors, as in arithmetic and algebra, but upon the *order* in which the multiplication is effected. This is, of course, a little perplex-

ing to the beginner, but is easily got over; and the mere consideration of this fact is often sufficient for the proof of theorems regarded in general as of no ordinary difficulty.

For further information, we must refer the reader to Sir W. R. Hamilton's *Lectures on Quaternions*, and to his *Elements of Quaternions*. Some elementary information may also be derived from papers by Kelland and Tait in the *Quarterly Messenger of Mathematics*, and the *Quarterly Mathematical Journal*. The subject is yet in its infancy, but even now its power is herculean; and its extreme simplicity and generality recommend it to all who are desirous of extending the effective range of mathematical analysis.

QUATRAIN (Fr. *quatre*, four) is the name given (originally by the French) to a little poem of four verses (lines) rhyming alternately, or even sometimes to four verses of a longer poem, such as a sonnet, if they form a complete idea within themselves. Epigrams, epitaphs, proverbs, &c., are often expressed in quatrains.

QUATRE-BRAS (Four Arms), a village of Belgium, province of South Brabant, about ten miles south-south-east of Waterloo. It is situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name. On the 16th June 1815—two days before the battle of Waterloo, Q. was the scene of a desperate and sanguinary battle between the English under Wellington and the French under Ney. The honors of the field remained with the former; but the severe defeat of Blücher the same day at Ligny, rendered Wellington's hard-won victory almost valueless; and foreseeing that it would be impossible for him to maintain his position, the English commander retired next morning through Jemappes to Waterloo, in order to keep up his communication with the Prussian army. The loss of the English and their allies at Q. was in all 5200; that of the French, though beaten, amounted only to 4140. This is to be accounted for by the fact that, during the greater part of the engagement, the English had no cavalry (for the Belgian horse galloped off the field without striking a blow) and no artillery.

QUATREFOIL, an opening in tracery, a panel, &c., divided by cusps or featherings into four leaves. This form is much used as an ornament in Gothic architecture.

QUATREFOIL, a heraldic bearing meant to represent a flower with four leaves. It is not represented with a stalk unless blazoned as *slipped*, in which case the stalk joins the lower leaf.

QUATREMIÈRE, ETIENNE MARC, a learned French orientalist, was born in Paris 12th July 1782, and from his earliest childhood to his latest years, was literally immersed in abstruse studies, and lived more after the fashion of a medieval recluse than a modern scholar. His public life was almost eventless. Employed in 1807 in the manuscript department of the *Bibliothèque Impériale*, he was promoted in 1809 to the Greek Chair in the College of Rouen, and in 1819 to the chair of Ancient Oriental Languages in the Collège de France. In 1827 he became Professor of Persian in the School for Modern Oriental Languages. He died 18th September 1857. Q.'s erudition was something enormous, as might have been expected from his uninterrupted life-long devotion to study, but according to M. Ernest Renan (himself one of the first living orientalists), he was strikingly deficient in critical insight, and a genius for sagacious and luminous generalization. He would never believe in the hieroglyphic discoveries of Champollion; he despised comparative philology, and thought the labors of men like F. Schlegel, Boissier, Burnouf, &c. were wasted. But in less delicate fields of exploration he is safe. His historical and geographical memoirs, for example, are of incalculable value. Q.'s principal works are—*Recherches sur la Langue et la Littérature de l'Égypte* (Par. 1808), in which it is shown, in the clearest manner, that the language of ancient Egypt is to be sought for in the modern Coptic; *Mémoires Géographiques et Historiques sur l'Égypte* (Par. 1810); *Histoire des Sultans Mameloucks* (Par. 1837); from the Arabic of Makrizi; *Histoire des Mongols de la Perse* (Par. 1836), from the Persian of Rashid-Eddin; and his edition of the Arabic text of the Prolegomena of Ibn-Khaldun, one of the most curious monuments of Arabic literature.

Besides these, a multitude of most valuable articles are scattered through the pages of the *Journal Asiatique* and the *Journal des Savants*. It is deeply to be regretted that circumstances interfered to prevent his executing certain great lexicographical works—Arabic, Coptic, Syriac, Turkish, Persian, and Armenian dictionaries—which he had planned, and for which he had gathered ample materials. His old master, Silvestre de Sacy, pronounced him 'the only man capable of making an Arabic dictionary.'

QUA'VER, in Music, a note whose measure is equal to half a crotchet, one-fourth of a minim, or one eighth of a semibreve.

QUAY (Fr. *quai*), an artificial landing-place or wharf, consists usually of a platform on piles, or of masonry, surmounted with cranes, tramways, and other appliances for lading and discharging cargoes for shipping.

QUEBEC, the most important military position in the Dominion of Canada, is situated on a steep promontory at the junction of the rivers St. Lawrence and St. Charles, in lat. 46° 48' N., long 71° 12' W. It is distant from Liverpool about 2070 miles, is 180 miles north-east of Montreal, 503 miles east-north-east of Toronto, and 430 miles north-north-east of New York. It is connected with all the cities in America by means of the Grand Trunk Railway. The site of Q., originally occupied by an Indian village named Stadacona, was discovered by Jacques Cartier in 1535; but the city was founded by Champlain in 1608. It continued to be the center of French trade and civilization as well as of Roman Catholic missions in North America till 1759, when it fell into the hands of Britain by the memorable victory of Wolfe on the heights of Abraham above the city. Q. remained the chief city of Canada till the British settlements in the West were erected into a separate province, when it became the capital of Canada East, now forming the province of Q. in the Dominion of Canada. The citadel of Q. is the most impregnable fortress on the continent of America. The view which it commands is one of the most magnificent in the world, and the scenery in its neighborhood, amid which are the Falls of Montmorenci, imparts an additional attraction to the city. A seminary for the education of Roman Catholic clergymen was established in the city in 1636 by M. de Laval de Montmorenci, and was raised by the queen in 1854 into a university bearing Laval's name. A Presbyterian college named after its founder, Dr. Morrin, was instituted in 1862, and affiliated in the following year to the McGill University of Montreal.

Q. is the seat of a Roman Catholic archbishop and an Anglican bishop, whose respective cathedrals are among the finest specimens of Canadian church architecture. The Church of Scotland and the principal denominations of dissenters are also represented in the city. From the building yards of Q. there are annually launched between 30 and 40 vessels of various tonnage. From 1400 to 2000 vessels enter the port every year from the ocean, principally to export the produce of the country. The chief export trade is in timber. The principal imports are woollen, cotton, and silk goods; iron, coal, hardware, and salt. In the three years 1879–81, the total exports of Q. rose from \$4,665,000 to \$12,200,000, and the imports from \$2,890,000, to \$4,500,000. Q. has extensive harbor works, and steam communication with Liverpool, London, Glasgow, &c. Pop. (1871) 59,699; (1881) 62,446. The city returns three members to the Dominion parliament, and three to the provincial legislature. For the province, see CANADA.

QUE'DAH, KEDAH, KEDDAH, KEEDAH, or KIDAH, a half independent state, on the west coast of the Malay Peninsula, on the Strait of Malacca. It extends from about latitude 5° north, to latitude 7° north, and its average breadth is about 50 miles. The British province Wellesley, which lies between it and the sea-coast opposite to Penang, was separated from it and ceded to the British in 1800, by a treaty in which the British agreed to pay the rajah 10,000 dollars a year. Q. nominally owes a kind of fœdal subjection to Siam, but is in reality much more subject to the sway of Britain.—The capital, from which the state takes its name, stands at the mouth of a river also of the same name, in lat. 6° 6' N., and long. 100° 20' E. Its pop. is estimated at about 21,000.

QUE'DLINBURG, a town of Prussian Saxony, at the northern base of the Harz Mountains, on the river Bode, and 35 miles south-west of Magdeburg. Founded by Henry the Fowler in 920, it consists of an old town, a new town, and several suburbs, and is surrounded by a wall flanked with towers. On an eminence overlooking the town stands the castle, which, prior to the Reformation, was the residence of the abbesses of Q., who were independent princesses of the empire, and had a vote in the diet, and other privileges. This town was a favorite residence of the German emperors of the Saxon line. Here Klopstock was born. It is now the center of considerable industry. Cloth is manufactured, and there is a good trade in corn and cattle. Pop. (1880) 18,437.

QUEEN (Sax. *cwen*, woman; Gr. *gyne*, woman; Sansc. *gōni*, mother, from *gan*, to generate), in its primary signification, the king's consort, who has in all countries been invested with privileges not belonging to other married women. The English queen, unlike other wives, can make a grant to her husband, and receive one from him. She can sue and be sued alone, and purchase land without the king's concurrence. The Statute of Treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the queen consenting is herself guilty of treason. If accused of treason, the queen is tried by the peers of the realm. A duty, amounting to one-tenth of the value of fines on grants by the crown, was in former times due to the queen, under the name of Queen-gold. Charles I. purchased it from his consort, Henrietta Maria, in 1635, for £10,000, but it was not renewed at the Restoration.

The queen-consort is exempt from paying toll, and from amercements in any court. She has a household of her own, consisting of six Ladies of the Bedchamber, a Lord Chamberlain, Vice-chamberlain, Mistress of the Robes, Master of the Horse, and three Equerries, as also her Attorney-general and Solicitor-general, distinct from those of the king, who are entitled to take a place within the bar along with the King's Counsel, and prosecute suits in law and equity for the queen. It has been the usual practice to crown the queen-consort with solemnities similar to those used in the coronation of the king. In the case of Queen Caroline, consort of George IV., who was living apart from her husband, this was not done, though her right to coronation was argued by Mr. Brougham before the Privy Council. Certain rents or revenues were anciently appropriated to the income of the queen, but no separate revenues seem ever to have been settled on any queen-consort by parliament. Her personal expenses are defrayed from the king's privy purse.

The *Queen-dowager* is the widow of the deceased king. She retains most of the privileges which she enjoyed as queen-consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the queen-dowager without permission from the king, on pain of forfeiture of lands and goods. On the marriage of a king, or accession of an unmarried prince, parliament makes provision for the queen's maintenance, in case of her survival. An income of £100,000 a year, with two residences, was settled on the queen of George III.; and the same provision was made for the late Dowager Queen Adelaide, at the commencement of the reign of William IV. The queen-dowager, when mother of the reigning sovereign, is styled the Queen-mother. Until the time of George II., queens-consort bore the arms of the king impaled with their paternal coat, with the king's dexter and their paternal sinister supporter; since that period, they have used both royal supporters. It is not usual to place the arms of the queen-consort within the Garter.

The *Queen-regnant* is a sovereign princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of males, a female succeeds to the throne. By an act of Queen Mary, the first queen-regnant in England, it was declared 'that the regal power of this realm is in the queene's majestie as fully and absolutely as ever it was in any of her most noble progenitours kings of this realme;' and it has since been held, that the powers, prerogatives, and dignities of the queen-regnant differ in no respect from those of the king. The husband of the queen-regnant is her subject; but in the matter of conjugal infidelity, he is not subjected to the same penal restrictions as the queen-consort. He is not endowed by the constitution with any political rights or privileges, and his honors and precedence must be derived from the queen. The late Prince Consort was naturalized by 3 and 4 Vict. c. 1, 2, words being used which enabled him to be a privy-councillor, and sit in parliament; and by 3 and 4 Vict. c. 3, Queen Victoria was empowered to grant him an annuity of £80,000; but it was provided that His Royal Highness was not, by virtue of his marriage, to acquire any interest in the property of her Majesty. By a decree of the Queen, Prince Albert enjoyed place, pre-eminence, and precedence next to her Majesty.

A queen-regnant is the only woman who is in her own right entitled to bear her arms in a shield and not in a lozenge. She is also entitled to the exterior ornaments of helmets, mantling, crest, and motto, and may surround her shield with the Garter, and the collars and ribbons of all other orders of knighthood of which she is sovereign.

QUEEN ANNE'S BOUNTY, the name given to a fund appropriated to increase the incomes of the poorer clergy of England, created out of the first-fruits and tenths, which before the Reformation formed part of the papal exactions from the clergy. The first-fruits are the first whole year's profit of all spiritual preferments, and the tenths are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice; but the poorer livings are now exempted from the tax. Henry VIII., on abolishing the papal authority, annexed both first-fruits and tenths to the crown; and statute 2 and 3 Anne, c. 11, first formed them into a perpetual fund for the augmentation of poor livings, and advancing money to incumbents for rebuilding parsonages. The Archbishops, Bishops, Deans, Speaker of the House of Commons, Master of the Rolls, Privy Councillors, Lieutenants, and *custodes rotulorum* of the counties, the Judges, Queen's Serjeants-at-law, Attorney and Solicitor-general, Advocate-general, Chancellors and Vice-chancellors of the two Universities, Lord Mayor and Aldermen of London, and mayors of the several cities; and by supplemental charter the officers of the Board of Green Cloth, the Queen's Council, and the four Clerks of the Privy Council, were made a corporation by the name of 'The Governors of the Bounty of Queen Anne, for the augmentation of the Maintenance of the Poor Clergy;' and to this corporation was granted the revenue of first-fruits and tenths.

Queen Anne's charter has been regulated and supplemented by a number of statutes, the latest being 33 and 34 Vict. c. 89. According to the rules established by the trustees, the sum allowed for each augmentation is £200, to be laid out in land to be annexed to the living: this donation to be made: 1. To all livings below £10 a year; 2. To all livings below £20; and so in order, while any remain under £50. But when any private benefactor advances £200 for the augmentation of any living not above £45 a year, the trustees give another £200, though it may not belong to the class of livings which they are then augmenting.

QUEEN ANNE'S FARTHING. The farthings of Queen Anne have attained a celebrity from the large prices sometimes given for them by collectors. Their rarity, however, has been much overrated; it was, indeed, long a popular notion that only three farthings were struck in her reign, of which two were in

Queen Anne's Farthing.

public keeping—a third was still going about, and, if recovered, would bring a prodigious price. The Queen Anne farthings were designed by a German of the name of Crocker or Croker, principal engraver to the Mint; and were only patterns of an intended coin, having never been put into circulation; but they are by no means exceedingly scarce. A few of them were struck in gold.

QUEENBOROUGH, a village in the Sheppey district of Kent, about 2 miles south of Sheerness. It was founded by Edward III. and named after his Queen, Philippa. A line of steamers recently established between Q. and Flushing affords a direct and rapid passage from England to the continent.

QUEEN-POST, the side or secondary upright ties in a trussed-roof. See ROOF.

QUEEN'S BENCH, or KING'S BENCH, one division of the High Court of Justice, which was a separate court until the changes introduced by the Judicature Act of 1873, and subsequent acts. The King's Bench was so called from its origin, the king being wont to sit there in person. In Cromwell's time, it was called the Upper Bench. The court consists of five judges, a President (who is called the Chief-justice of England, and is the highest of all the judges next to the Lord Chancellor), and four puisne judges called justices. In 1874, the old courts were reconstituted, and all were merged in the High Court of Justice, which consists of four divisions, each of which, however, retains nearly the same jurisdiction as before such change, and the only appeal from each is to the High Court of Appeal, which exercises the functions formerly vested in, and from remote antiquity exercised by, the House of Lords. The ancient jurisdiction of the court, and the history of its modifications, are too technical to be stated in this place, but the outline of the leading points of jurisdiction may be shortly stated. The Q. B. is the highest court which has a criminal jurisdiction, and such jurisdiction is unlimited. But practically, this jurisdiction is seldom exercised originally, for it is only when an indictment is removed from an inferior court into the Q. B. that a criminal trial takes place there, and this is only the case when there is some peculiar difficulty or importance attending the trial, which renders it expedient to remove it from the sessions or assizes. But though criminal trials in the Q. B. are exceptional, there are certain criminal matters which are part of its ordinary administration. A criminal information, for example, when filed by the Attorney-general, or the master of the Crown-office, charging a person with a criminal offence, is tried in the Q. B. as a matter of course, and can be tried in no other court.

The Q. B. exercises a superintending control over all inferior tribunals, and also over public bodies, by commanding them to do a specific duty, the writ being called a writ of Mandamus; or by prohibiting them from going on with some matter over which they have no jurisdiction, by a writ called a writ of Prohibition. The Q. B. also entertains appeals from justices of the peace on a vast variety of matters. Besides the criminal jurisdiction, and the prerogative writs of Mandamus, Prohibition, and Quo Warranto, there is a civil jurisdiction belonging to the Q. B. of the most extensive kind; indeed, any civil action to recover debts and

damages may be brought there. The civil jurisdiction is mostly shared in common with the other two common-law divisions. The judges of the Q. B. are often called the Queen's Coroners, having a universal jurisdiction of that kind throughout England, though seldom acting in that capacity. The Chief-justice has latterly been usually made a peer, or has the option of becoming one if he pleases. The officers of the court are the Master of the Crown-office, and several masters of the court. [Further consolidation of the common law courts took place in 1881, and the High Court of Justice is now divided into the three divisions of Chancery; Common Law; Probate, Divorce, and Admiralty.]

QUEEN'S COLLEGE, OXFORD. In 1840 Robert de Eglesfield, chaplain or confessor to Queen Philippa, founded, by license of Edward III., a collegiate hall in Oxford, under the name of the Hall of the Queen's Scholars. In his statutes, he sets forth his motives and objects with unusual minuteness. Theological study was the main object of the foundation. Residence was rigidly enforced, and poverty enjoined with peculiar force. The original number of the provost and fellows was to be 13, in memory of our Lord and the 12 apostles; and the ultimate number of poor boys to be educated on the foundation was 72, in memory of the 70 disciples. Few colleges, however, have disregarded more directly the wishes of their founders. When the Commissioners under 17 and 18 Vict. c. 81 began their work, they found the poverty required changed into a provostship of £1000 a year, and fellowships of £300, the conditional preference to north-countrymen converted into an absolute exclusion of all others; and the 72 poor children represented by 8 'taberdars', as they are called, who were alone eligible to fellowships. A separate foundation had been given to Queen's by John Michel, Esq., in 1736, consisting of 8 open fellowships, and 4 open scholarships. The Commissioners introduced great changes. The foundations are consolidated, and the college now consists of a provost, 19 fellows, 15 scholars or taberdars, 2 Bible-clerks, and 4 Eglesfield exhibitors. There are also upwards of 20 exhibitions in this college, some of which are confined to natives of the northern counties. There are 30 benefices in the gift of the college, also the principalship of St. Edmund Hall.

QUEEN'S COLLEGE, CAMBRIDGE, was founded in 1446 by Margaret of Anjou, consort of Henry VI., and refounded in 1465 by Elizabeth Woodville, consort of Edward IV. The college consists of a President and 14 foundation Fellows; the fellowships being tenable for 10 years from M.A. without being subject to any restrictions whatsoever; while any Fellow who takes holy orders, and has not a benefice of the net annual value of £300, may hold his fellowship for life. The new statutes provides that there shall be at least 14 scholarships, tenable till B.A., ranging between £30 and £50; the number and value of the scholarships to be augmented at the discretion of the President and Fellows. Besides these, there are five exhibitions, ranging from £12 to £20; and there are funds to the amount of £130 per annum at the disposal of the President, for the behoof of deserving students of limited means. There are likewise a number of prizes, ranging from £5 to £30. The College holds the patronage of ten benefices in the counties of Bucks, Cambridge, Essex, Leicester, Norfolk, Notts, and Wilts.

QUEEN'S COUNSEL are certain barristers who receive from her Majesty a patent giving them preaudience over their brethren, and but for which they would rank only according to seniority of their standing as barristers. The advantage of appointing Queen's Counsel is this, that it enables the most able or successful counsel to take precedence of those of the same or longer standing, and to take the chief conduct of causes. In practice, there are almost invariably two counsel engaged on each side, called a leader and a junior, and the leader is generally a Queen's Counsel, and the junior is not. The appointment is made by the crown, on the nomination of the Lord Chancellor. The practice of appointing crown counsel is adopted in Ireland, and also in Scotland. In the Courts of Chancery in England, it was usual for a Queen's Counsel to confine himself to a particular Vice-Chancellor's court, or to that of the Master of the Rolls, so that his clients might thus reckon on his attendance there; and when he went into another court, he required an addition to his fee. In the common-law courts, however, this arrangement was impracticable, and had never been adopted. It is sometimes popularly believed that the appointment of Queen's Counsel entitles the counsel to a salary from the crown; but this is a mistake, except as to the Attorney and Solicitor-general. When a Queen's Counsel is engaged in a criminal case against the crown, as, for example, to defend a prisoner, he requires to get special license to do so from the crown, which is always given, as a matter of course, on payment of a small fee. In courts of law and equity, a Queen's Counsel is entitled to preaudience over all other counsel, except those who were appointed Queen's Counsel before him. A Queen's Counsel has preaudience over all Serjeants-at-law, though many of the latter obtain patents of precedence, which also make them in effect Queen's Counsel, as well as serjeants, and prevent them being dis-

placed by those who come after them. The order of Serjeants-at-law is much more ancient than that of Queen's Counsel, though now it is in point of rank inferior. The practice of appointing Queen's Counsel is not older than the time of Sir Francis Bacon, who was the first appointed.

QUEEN'S COUNTY, an inland county of the province of Leinster, Ireland, is bounded N. by the King's County, E. by Kildare and Carlow, S. by Kilkenny, and W. by Tipperary and King's County. Area, 424,854 acres, of which 368,153 are arable. The population, in 1861, was 90,750; in 1871, 79,771; in 1881, 72,598, of whom 63,963 were Catholics, 7743 Protestant Episcopalians, and the rest Protestants of other denominations. The number of acres under crop in 1881 was 139,831; cattle, 74,277; sheep, 74,344; pigs, 28,021. Q. C., for the most part, is within the basin of the Barrow, which is the chief river, and is partly navigable for barges. On the north-western border lie the Slieve Bloom Mountains, and the Dysart Hills occupy the south-east; the rest of the surface being flat or gently undulating. In its geological structure, it belongs to the great limestone district; but the Slieve Bloom Mountains are sandstone, and the Dysart Hills include coal, but not in deep or profitably worked beds. Coarse linen and cotton cloths are manufactured in small quantities. The chief town is Maryborough; pop. (1881) 2872. The National schools in 1880 were 107; pupils, 13,274. Q. C. anciently formed part of the districts of Leix and Ossory; and on the submission of O'More to the English, the territory retained a qualified independence. Under Edward II., the O'Mores became so powerful, that a protracted contest was maintained by them with the English. In the reign of Edward VI., Bellingham, the lord-deputy, succeeded in re-annexing the territory of the O'Mores to the Pale (q. v.); and a new revolt in Mary's reign led to measures by which it was finally reduced to a shire, under the name Q. C., in honor of Mary, from whom also the chief town, Maryborough, was called. There are a few antiquities of interest—a perfect round tower, and two in a less perfect condition, and some ecclesiastical and feudal remains, the most important of the latter being a castle of Strongbow on the picturesque Rock of Dunamase. Q. C. is traversed by the Great Southern and Western, and by the Midland Great Western Railways, and also by a branch of the Grand Canal. It returns two members to parliament.

QUEEN'S EVIDENCE. See KING'S EVIDENCE.

QUEENSFERRY, SOUTH AND NORTH.—South Q. is a royal and parliamentary burgh in Linlithgowshire, on the south shore of the Firth of Forth, about 9 miles west-north-west of Edinburgh. It was erected into a royal burgh in 1636, but was for centuries before a burgh of regality. The walks and scenery about South Q., with Hopetoun House and grounds on the west, and Dalmeny Park on the east, are very beautiful, and the town itself is a good deal resorted to for sea-bathing. The Forth—much wider both above and below the ferry—here narrows to a width of only about two miles. It receives historical mention as early as the middle of the 11th c., as the ferry between Edinburgh and Dunfermline. A railway bridge across the Firth here was begun in 1878, abandoned after the Tay Bridge disaster, and re-commenced on a new plan in 1881. Pop. (1881) 1966. South Q. is one of the Stirling district burghs.—*North Queensferry*, a small village in Fifeshire, on the north shore of the Firth of Forth, opposite South Q.; pop. (1881) 360.

QUEEN'S LAND. This prosperous British colony occupies the whole of the north-eastern portion of Australia, commencing at a point of the east coast about 400 miles north of Sydney, called Point Danger, in lat. 28° 8' S. The greater portion of the southern boundary-line is formed by the 29th parallel of south latitude. The eastern seaboard extends about 1800 miles to Cape York, the extreme northern point of the continent, in lat. 10° 40'. The mean breadth of the territory is 900 miles, from the eastern coast-line to the meridian of 138° E. long., which forms the western boundary-line. This includes the greater portion of the Gulf of Carpentaria, which has a seaboard of about 900 miles. The whole of Q. comprises 669,520 sq. m.—nearly twelve times the area of England and Wales.

The portion of the colony extending along the eastern coast, is indented with numerous bays, which are the outlets of many navigable rivers, having their sources in the cool gorges and deep recesses of a great mountain-range, running north and south, parallel with the sea-coast, at a distance of from 50 to 100 miles. The summits of this great 'dividing range' rise from 2000 to 6000 feet above the level of the sea. Numerous spurs are given off from the range in ridges sloping gradually towards the coast. These ridges are generally composed principally of quartz, and in many places form good natural roads for a considerable distance. The ridges are usually covered with a variety of fine and valuable timber. The iron-bark, blood-wood, box, and other descriptions of wood, very valuable to the farmer for fencing and building, are found here in great abundance.

Unlike almost every other portion of Australia, Q. is correctly

described as a 'land of rivers and streams.' These rivers find an outlet in the many large and beautiful bays and estuaries on the eastern seaboard. One of these, Moreton Bay (q.v.), receives the waters of five rivers, which are always navigable. The largest of these, the Brisbane, is navigated by good-sized steamers for 75 miles, and is nearly a quarter of a mile wide at a distance of 15 miles from its mouth. The principal rivers on the eastern seaboard are the Brisbane, the Burnett, the Mary, the Calliope, the Boyne, the Fitzroy, the Pioneer, and the Burdekin. The longest tidal river in Q. is the Fitzroy, which drains an area of not less than 50 millions of acres, and is navigable as far as Yaruba, 60 miles from its estuary in Keppel Bay. It receives, as its principal tributaries, the Dawson, Mackenzie, and Isaacs, large streams flowing for several hundred miles from the north-west, west, and south-western parts of the interior. The tide at Rockhampton (40 miles from the embouchure of the river) rises 14 feet, and the stream is thus rendered navigable for vessels of considerable burden.

The banks of the rivers are usually well elevated, and in many places consist of very rich alluvium, brought down from the great mountain-ranges. This alluvial soil is frequently of very great depth, and is marked everywhere by a magnificent growth of timber, very unlike the ordinary Australian wood. The enormous fig-trees and gigantic eucalyptæ tower aloft, and spread out their great arms, festooned with vines and flowering parasites, which throw themselves over every spreading branch, and deck it with their varied and brilliant colors; the tall pine-trees shoot up their straight stems to a great height; while the cedar, the myrtle, the rosewood, and tamarind trees, display their rich and green foliage in every variety of shade. A thick evergreen hedge of mangroves covers the banks, preserving them from the wash of the stream; and at certain seasons of the year, this is fringed with thousands of flowering lilies.

Ordinarily, the eastern sea-board part of the country assumes very much the appearance of park-scenery in Great Britain, the trees standing at some distance apart, and the ground between them being covered with grass, which is generally green and luxuriant throughout the whole year. The regularity of the showers which fall in the summer season keeps the grass growing with luxuriant verdure generally during the hot months. Exceptions to this sometimes occur, and a dry summer appears to have been experienced in this part of Australia about once in every six or seven years. The summer of 1863 formed one of these exceptional seasons. The frosts of winter being generally so slight as not to injure the vegetation, the country is almost always green from January to December.

Beyond the 'Andes,' or great dividing-range, the country presents features of still greater beauty and fertility. Vast plains—10, 15, or 20 miles across—stretch out their level surface unbroken by a single tree, but covered with luxuriant grass, and often purpled over with fragrant herbage. These great plains are composed of rich black soil. They are well watered with a network of streams, which trickle down from the gradual slopes of the mountain-range. The soil in this locality is admirably adapted for tillage; and within a certain distance of the mountain range, the rains fall with great regularity. The land here is lightly timbered, and is cleared with less labor than on the lower lands, and the soil is proved to be peculiarly adapted for the growth of wheat of the finest quality. The yield per acre in this locality has sometimes been as much as 50 and even 60 bushels to the acre, of 63 lbs. to the bushel. The average yield may be estimated at 30 bushels per acre. Indian corn and other cereals as well as all the European fruits, grow luxuriantly, and come to the greatest perfection in this highly-favored locality, which has been called the 'Garden of Queensland.'

This country, west of the great dividing-range, stretches away in a series of fine plateaux for a distance of 400 or 500 miles westward, and, with the interruptions of other mountain-ranges crossing the main range at right angles, for upwards of 1000 miles towards the fertile plains bordering the shores of the Gulf of Carpentaria.

A third distinct portion of Q. is formed by the country which falls off in a succession of steep declivities, or more gradually descending terraces, from the table-land thus described, towards the lower land, which then intervenes between these terraces and the western boundary-line of the colony and of South Australia.

The 'settled districts,' by far the most important part of the colony, occupy the southern part of the strip watered by rivers discharging eastwards at the Pacific. This region, a comparatively small area in the south-east of Q., is not merely the most populous and rich, but is more suitable for agriculture, and contains the chief deposits of coal and gold. Sheep do not thrive here so well as further west. A second district is watered by rivers running north-west to the Gulf of Carpentaria; it is a partially settled pastoral country, with some mines. The great pastoral plains, already mentioned, form the third drainage area, the

streams in it running partly into the marshes of South Australia, or into the Darling and Murray rivers.

Two-thirds of Q. lie within the tropics. The climate on the whole is hot, but varies much according to situation. At Brisbane, in the temperate part of the country, the average temperature in recent years was 78°; the absolute maximum 108°; the absolute minimum, 34°. The climate may fairly be compared with that of Madeira, which it is said to resemble. On the north coast the monsoons blow regularly, and the year is divided into seven dry and five wet months. November to April is the rainy season. On the downs and high lands the air is cool, and on the east coast the sea-breeze tempers the heat. The rainfall varies prodigiously both according to locality and from year to year. In the same year (1878) 56 inches fell at Brisbane in 124 days; at Mackay, the rainfall was 86 inches; at Toowoomba, on the Darling Downs, 100 miles from Brisbane, only 29 inches; and at other places, only 19, 16, and even 10. Again, in 1865, 24 inches fell at Brisbane; in 1870, 79. Long droughts and destructive floods are not unknown. In the north, especially in the low lands, the heat of the tropical sun is too great for Europeans, though gold-mining is pursued by Europeans within the tropical limits. Nevertheless, the climate of Q., is on the whole very healthy, the death-rate never having exceeded 24 per 1000, while in some places it is only 14. The birth-rate is very high.

The Alienation of Crown-lands Act, passed during the first session of the colonial parliament, revolutionized the old plan of selling land at a high upset price at auction, and the disposal of lands in Q. is now regulated by a series of acts passed since 1868 (including the Land Amendment Act of 1879).

Land is least for pastoral purposes, or purchased in fee simple. Leases of land in the not as yet settled districts may be had for 21 years, at a rent of 5s. a square mile for the first seven years, 10s. for the second, and 15s. for the third seven years. A condition of the lease is that the land must be stocked to the extent of one-fourth of its capacity—namely, 100 sheep or 10 cattle per square mile. The amount so leased must be not less than 28 square miles, or more than 100 square miles. The quantity of land that may be purchased by one person, and the price to be paid for it, vary according to the position of the land. The largest quantity anywhere sold by the system of 'conditional selection,' is 5120 acres; the lowest, 40 acres. The lowest price is 5s. an acre; the highest about 15s. Payment may be made in ten annual instalments. It is required that the purchaser or his bailiff should reside on the land, that certain improvements should be made, and part of the land be tilled. If at the end of three years all the conditions have been so far fulfilled, the purchaser may pay up the money and get a deed of the land. The Homestead Law encourages the settlement of industrious farmers. On condition of continuous residence for five years, and cultivation or improvement to the value of 10s. per acre, the homestead selector gets 160 acres of land or less at the nominal price of sixpence an acre per annum for five years.

Q. is a great pastoral country, the wool of its sheep being remarkable for fineness; and towards the north the fleeces, though they diminish in quantity, rather increase in fineness. Much of the soil is very fertile, and soil and climate are suited for the production of a great variety of crops, including wheat, barley, oats, maize, tobacco, coffee, rice, potatoes, arrowroot, sugar, and cotton. Semi-tropical fruits grow as well as English ones; and bananas, pine-apples, guavas, melons, citrons, oranges, yams, grow side by side with the fruits and flowers of Northern Europe. Still, agriculture is not a favorite calling in Q. Whereas in South Australia there are under tillage nearly seven acres of land per head of population; in Q. there is only one. In 1881 only about 11,000 acres were under wheat, while 44,000 were under maize. Sugar is now the favorite crop. During the American war, cotton was extensively grown: in 1871, 6000 bales were raised; in 1881, only 125,750 lbs. were produced. In the year 1880–81 the total area of land under cultivation was 120,881 acres (14,000 more than in preceding year). Besides the grain crops, potatoes, sugar, and cotton, the items sorghum, tobacco, bananas, pine-apples, oranges, and vines for wine-making, occupied most part of the tilled ground. The growth of cotton led to the introduction of South Sea Islanders as laborers, the employment of whom is regulated by special acts. It seems doubtful whether, for such crops as sugar, cotton, and tropical fruits, European labor can suffice, and whether the help of Chinese or coolies may not soon be required.

The mineral resources of Q. are very great. Gold has been plentifully found, especially since 1867; and in 1880 about twenty gold-fields were being wrought. There are both quartz and alluvial workings. Of late years there has been less decrease in the quantity of gold found than in any other Australian colony. Copper is extensively found; boundless stores of tin keep some twenty mines at work, though the output varies from year to year. Antimony is found. The coal-beds of Q. are very productive, and in some of them the coal is of very fine quality. It has been

estimated that the coal-beds underlie an area of near 24,000 sq. miles.

Pearl fishery is carried on with good results in the extreme north; those employed are chiefly South-Sea Islanders and Malays. Bêche de mer (trepang) occurs on the barrier reef and elsewhere, and the securing of it employs many hands and brings much profit. The dugong fishery is industriously pried; the oil of the dugong being valuable for various purposes.

There are several railways, of which a mileage of more than 600 miles are in operation. A scheme for a railway connecting Q. with New South Wales was being promoted in 1881; and a company has been formed to connect the settled districts by railway with the Gulf of Carpentaria.

At the census of 1871 the population of Q. was 120,306. At that of 1881 it was 213,525 (an increase of 23 per cent. on the population in 1876); of whom 11,229 were Chinese, and 6348 Polynesian. The government officials numbered 1426; professional persons, 2899; engaged in domestic duties, and children, 122,437; tradesmen, carriers, &c., 10,473; squatters, agriculturists, &c., 33,261; mechanics, manufacturers, 33,117; and miscellaneous workers, 5530.

The capital of Q., and the seat of the local government, is Brisbane (q. v.); pop. (1881) 30,955. Ipswich, Rockhampton, Cooktown, Maryborough, Gladstone, Toowoomba, Gayndah, Dalby, and Bowen are rising towns.

The revenue for the year 1880-81 was £1,771,251 (an increase on preceding years); the expenditure £1,757,653. The public debt was £13,350,000 (on which the interest is £599,000). The amount of revenue per inhabitant in 1881 was £3, 6s. (of which only about £3, 12s. is derived from taxation, the rest from crown-lands, &c.), and the debt was in the proportion of £62 in 1881. In 1880 the exports amounted in value to £3,216,999, and the imports to £2,881,555. The chief articles of export, the produce of the colony, were tin (ore and smelted), copper (ore and smelted), cotton, gold, rum, sugar, wood, tallow, hides, preserved meats, maize, green fruits, shell-fish, bêche de mer, pearl, shell, arrow-root, coal, cedar, sawn pine. The imports include most kinds of manufactured goods, the bulk being from the United Kingdom; but of late a brisk trade has arisen in American manufactures, especially agricultural implements and tools. (A table showing the development of the revenue, exports, &c. of Q. and the other Australian colonies in the ten years 1870-1880, will be found at the article AUSTRALIA.)

Amongst the mills and manufactories of Q. in 1880 were above 80 sugar-mills, 25 tanneries, 70 brick-works, also flour-mills, saw-mills, tobacco-factories, soap and candle works, breweries, foundries, confectionery works, agricultural implement works—the total number being upwards of 570.

In 1880, 1225 vessels, of 633,673 tons, entered the ports of Q., and 1221, of 621,903 tons, cleared. There were registered in the colony 26 ocean steamers (of 12,895 tons), 17 harbor steamers, and 35 river steamers. There are 20 lighthouses on the coasts of Q., besides lightships and 70 minor lights.

Q. was erected into a separate and independent colony in December 1859. The government is vested in a Governor (the Queen's representative), an Executive Council, and two Houses of Parliament. The Legislative Council consists of 30 members, nominated by the crown for life, under a president elected by themselves. The House of Assembly comprises 55 deputies elected for five years. The suffrage is not universal, but within the reach of every industrious man after a twelvemonth's residence. Voting is by ballot. State aid to religion was abolished by one of the first acts of the parliament. An excellent system of primary education, which, since 1870, has been made free, is in successful and vigorous operation throughout the colony. Other changes were introduced in 1876, the Department of Public Instruction being placed under a Minister for Education.

QUEEN'S METAL, an alloy formed by fusing 100 parts of tin with 8 parts of antimony, 4 parts of copper, and 1 part of bismuth. It is a kind of Britannia metal, and is used for teapots and similar articles of domestic utility.

QUEEN'S REGULATIONS, or KING'S REGULATIONS, are those collections of orders and regulations in force in the army and navy respectively, which serve to guide commanding and other officers in all matters of discipline and personal conduct. The queen's regulations for the navy also in a great degree regulate matters of finance; whereas, in the army, financial matters are left to the War-office Regulations (q. v.). The reason for this distinction is, that as regards the navy, the Admiralty are responsible both for discipline and finance; while in respect to the army, the officer commanding-in-chief controls the discipline, and the financial secretary the finance, both of course being responsible to the Secretary of State for War, and through him to parliament. The regulations for the army were first collected in 1788, since which several editions have been issued. The current regulations are supplemented, corrected, and cancelled by numerous

circulars and addenda; so that they never represent the whole body of military or naval rules for many days together. Every officer must have a copy, and must thoroughly know the contents.

QUEEN'S TOBACCO-PIPE, the facetious designation of a peculiarly shaped kiln, which used to be situated at the corner of the Tobacco Warehouse belonging to the London Docks. The kiln consisted of a circular brick stalk, bulging out at the bottom to a width of five feet inside. In the interior were piled up damaged tobacco and cigars, and contraband goods, such as tobacco, cigars, tea, silk, &c., which had been smuggled, books which are attempted evasions of the Copyright Act, &c., till a sufficient quantity had accumulated, when the whole was set fire to and consumed. The total value of the goods thus destroyed was enormous; and though this wanton destruction was often censured, government continued till recent years periodically to fill and light the 'Queen's Pipe.' Seized goods are now sold at the periodical 'customs sales,' where unclaimed goods, samples, &c., are also disposed of.

QUEENSTOWN, called formerly COVE OF CORK, Ireland, a seaport town, on the south side of Great Island, in the harbor of Cork, is distant from Cork 14 miles east-south-east, and from Dublin 157 miles south-west-by-west. It rose into some importance during the French war, as the port of embarkation for troops going on foreign service, and is now an admiral's station. On the occasion of the Queen's visit in 1850, the name Q. was given to it in honor of her Majesty. The formation of the town is rather peculiar, as it occupies the sides of an amphitheater, around which it is built in parallel streets. It enjoys a high reputation for its mild and salubrious climate, and is much frequented by invalids during winter. A splendid Roman Catholic cathedral, estimated to cost £100,000, is a conspicuous building; it is 100 feet in height, and the plan includes a tower of 230 feet. Pop. (1871) 10,334; (1881) 9738.

QUEEN'S YELLOW. See YELLOW COLORS.

QUENTIN, ST., a thriving manufacturing town in the north of France, department of Aisne, is situated on the Somme, about 80 miles north-east of Paris. Its population has more than doubled in 25 years, and in 1881 was 45,021. Q. has a celebrated church — 'one of the finest, boldest, and purest Gothic buildings in this part of Belgic Gaul.' Q. is the center of the manufacture of linen, muslin, lace, and gauze. The Canal of St. Quentin, connecting the basin of the Somme with that of the Scheldt, was finished by Napoleon in 1810. It is carried through the intervening hills by tunnels. At St. Q., a battle was fought, July 29, 1557, between the Spaniards, assisted by a body of English troops, and the French, in which the latter were defeated.

QUE'RCITRON, the name both of a dyestuff and of the species of oak of which it is the bark. This oak (*Quercus tinctoria*), also called *Dyer's Oak* and *Black Oak*, is a native of North America—one of the noblest forest trees of the United States, found in New England, and as far south as Georgia, although there only at a considerable elevation. The name Black Oak is given to it from the dark color of its outer bark. The leaves are obovate-oblong, dilated outwards, and widely sinuated; with short, obtuse, and bristle-pointed lobes. The wood is reddish, coarse-grained, and porous, but much esteemed for strength and durability, and is used in America for ship-building. The bark is used for tanning as well as for dyeing. It is the inner bark which is the quercitron of dyers. It yields a yellow crystallizable substance, *Quercitron* ($C_{12}H_{10}O_{10} + 2Ag$), which may be extracted by means of alcohol; the tanning acid, which is simultaneously taken up, must be precipitated by the addition of gelatine, after which the liquid will, on evaporation, yield crystals of quercitron. On the addition of alum, its solution assumes a beautiful yellow color; and solutions of acetate of lead, acetate of copper, and chloride of tin precipitate it in yellow flakes. When boiled with dilute acids, it breaks up into glycose and *quercetin* ($C_{12}H_{10}O_{10}$)—a yellow crystalline substance, which is soluble in alkaline solutions, to which it communicates a golden-yellow color. The decomposition shows that quercitron belongs to the glycosides, or compounds which, when broken up, yield sugar.

QUERETARO, an important town of Mexico, capital of a state of the same name, is charmingly situated on a hilly plateau, 6365 feet above sea-level, 110 miles north-west of Mexico. It is built on a regular plan, contains 11 convents, 3 great squares, many richly-decorated churches, &c. Water is supplied from an aqueduct ten miles long, and supported in part upon arches 90 feet high. Woollen and cotton goods and leather are the chief manufactures. Q. contains the largest cotton-spinning mill in the country; 3000 hands are employed in it. Here, when the town, after a long defence, fell into the hands of the Republicans, the Emperor Maximilian was shot by order of a court-martial, 19th June 1867. Pop. 48,000.

QUERN, a primitive mill for grinding corn, the stone of which was turned by the hand before the invention of windmills or water-mills. It is a contrivance of great antiquity, and so well adapted for the wants of a primitive people, that we find it perpetuated to the present day in remote districts of Ireland, and some parts of the Western Islands of Scotland. The remains of querns have been dug up in Britain, Ireland, and Continental Europe, wherever the traces of ancient population are found. They occur in the Scottish Earth-houses (q. v.), or cyclopean underground dwellings; in the Crannoges (q. v.), or lake-dwellings of Ireland and Scotland; and the very similar *Pfahlbauten* of Switzerland; and abundantly among the remains of the Roman period in Britain and Northern Europe.

The most usual form of quern consists of two circular flat stones, the upper one pierced in the center with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasionally ornamented with various devices; in the Roman period, it is sometimes funnel-shaped, with grooves radiating from the center. In using the quern, the grain was dropped with one hand into the central opening, while, with the other, the upper stone was revolved by means of a stick, inserted in a small opening near the edge. As early as 1284, an effort was made by the Scottish legislature to supersede the quern by the water-mill, the use of the former being prohibited except in case of storm, or where there was a lack of mills of the new species. Whoever used the quern was to 'give the threitein measure as multer;' the contravener was to 'fine [lose] his hand-mylne perpetuallie.' This enactment did not, however, prevent hand-mills from being largely used in Scotland down to the beginning of the present century.

Probably the oldest type of quern is that which was fashioned from a section of oak; one of this description was found in Scotland in 1831, in the course of removing Blair Drummond Moss. It is 19 inches in height by 14 in diameter, and the center is hollowed to a depth of about a foot, so as to form a mortar, in which the grain seems to have been pounded by a wooden or stone pestle.

A less simple variety of the hand quern, known as the Pot Quern, and also of great antiquity, consists of a circular stone basin, with a hole through which the meal or flour escapes, and a smaller circular stone fitting into it, perforated with an opening through which the grain was thrown into the mill. A number of querns of this description have been exhumed in Scotland, and still more in the bogs of Ireland, in which country the pot quern is believed not to be yet altogether disused. The subjoined woodcut represents one in the Museum of the Scottish Antiquaries; it

Quern.

is of unusually large size, 17 inches in diameter, and 8½ high, and was discovered in the parish of Gladsмур, in East Lothian. It is made of coarse pudding-stone, and is furnished with holes in the sides, to which handles were probably attached. The iron ring is a modern addition.—See Dr. Wilson's *Archæology and Prehistoric Annals of Scotland*, vol. i. p. 211, et seq., 2d edition (London and Cambridge, 1863).

QUESALTENANGO, a town of Guatemala, Central America, the capital of a dep. of the same name. It is 66 miles west-by-north from Guatemala, and stands in an elevated table-land, on a river which flows into the Pacific Ocean. Pop. 30,000.

QUESNAY, FRANÇOIS, an eminent French economist and physician, was born at Mérey, near Montfort-l'Amaury, June 4, 1694, and studied at Paris, where, in 1718, he passed surgeon with a high reputation. He acquired a high reputation in his profession, and at his death, in 1774, was first physician to the king. But Q.'s fame depends almost wholly on his economic speculations, which are to be found scattered through the pages of the famous *Encyclopédie* (see, for example, the articles 'Fermiers' and 'Grain'), the *Journal d'Agriculture*, and the *Ephémérides du Citoyen*. He is the inventor of the term 'Political Economy,' and one of the earliest and most distinguished writers on the subject. His views were systematically set forth in a little treatise, entitled *Tableau Économique*, which was nicknamed by La Harpe, the *Alcoran des Économistes*. Only a few copies of this work were printed about the end of the year 1758, and these have now all disappeared. Nevertheless, the principles maintained by Q. are

well known, partly from the sources above mentioned, but chiefly from other treatises that have met with a better fate than the *Tableau*, viz., his *Maximes Générales du Gouvernement Économique d'un Royaume Agricole*, the notes to which occupy more space than the text; *Le Droit Naturel; Analyse du Tableau Économique; Problèmes Économiques*; and *Dialogues sur le Commerce et sur les Travaux des Artisans*, all of which are to be found in Dupont's *Recueil* of Q.'s writings (Leyden and Paris, 1768).

QUESNEL, PASQUIER, a French theologian, was born at Paris, July 14, 1684, and having been educated in the Sorbonne, entered the Congregation of the Oratory in 1657. He obtained even early in his career the reputation of a profound familiarity with Scripture and the Fathers; and by several popular ascetical treatises which he published, he attracted so much notice, that, at the early age of 28, he was appointed director of the Paris house of his Congregation. It was for the use of the young men under his charge that he commenced the series of his afterwards celebrated *Reflexions Morales*. The first specimen of this work having been much admired, Q. continued to extend it to other portions of the New Testament. Soon afterwards, he published an edition of the works of St. Leo (2 vols. 4to, Paris 1675), which has been much criticised. His residence at Paris, however, was cut short by the disputes about Jansenism. Having refused to sign certain propositions, subscription to which was, by a decree of 1684, required of all members of the Oratory, Q. left the Congregation, and retired to the Low Countries, where he attached himself to the party of Arnauld, in which he speedily rose to the first position of influence and authority. He continued at Brussels his *Reflexions Morales*; and in 1698–1694, the *Reflections* on the New Testament were published in a complete form, with the approval of the Cardinal de Noailles, Bishop of Châlons, and ultimately Archbishop of Paris. The work, however, on examination, was found to contain all the most obnoxious doctrines of Jansenius; and Q., having been denounced to the authorities, was arrested, by order of Philip V., and put into prison. He escaped, and betook himself to concealment. But his book was condemned, first by the decree of an assembly of the bishops of France, and afterwards by a decision of Clement XI. in 1711, and finally by the celebrated bull *Unigenitus*, September 8, 1713.

With this condemnation, the formal dogmatic declarations of the Roman Church on this controversy may be said to have ceased. The controversy continued, but nothing, or very little, that was new was afterwards elicited. Q. withdrew to Amsterdam, where he lived to a great age, not having died till 1719, in his 85th year. Besides the *Reflexions Morales*, he left a vast number of treatises, chiefly ascetical. The few dogmatical essays which he published, as well as his critical editions of St. Leo, are all tinged with his peculiar opinions. The *Reflexions Morales* falling in, in the main, with the views of one of the religious parties in the Protestant Church, has been translated into German and English, and at one time enjoyed considerable popularity both in England and in Germany.

QUETELET, LAMBERT ADOLPHE JACQUE, a celebrated Belgian statistician and astronomer, was born at Ghent, 22d February 1796, and studied at the lyceum of his native city, where, in 1814, he became Professor of Mathematics. In 1819, he was appointed to the same chair at the Brussels Athenæum; and in 1826, was chosen by King William I. to superintend the construction of the Royal Observatory in the capital, of which he became director in 1828. In 1836, he was made Professor of Astronomy and Geodesy at the Brussels Military School. Elected a member of the Belgian Royal Academy in 1820, he became perpetual secretary in 1834. Q. was besides a corresponding member of the Institut de France and of the Royal Society of London. Among his numerous and valuable writings are—*Astronomie Élémentaire* (Par. 1826; 4th ed. Brux. 1848); *Recherches sur la Population, les Prisons, les Dépôts de Mendicité, &c., dans le Royaume des Pays-Bas* (Brux. 1827); *Recherches sur la Reproduction et la Mortalité et sur la Population de la Belgique* (Brux. 1832); *Statistique Criminelle de la Belgique* (Brux. 1832); *Sur l'Homme et le Développement de ses Facultés ou Essai de Physique Sociale* (Par. 1835); *Du Système Sociale et des Lois qui le régissent* (Par. 1848); and *Physique* (Brux. 1855). Q. was also one of the most efficient collaborateurs in drawing up the *Bulletin de la Commission Centrale de Statistique*, the *Annales des Mines*, the *Journal des Économistes*, the *Annales des Travaux Publics*, the *Trésor National*, &c. He also published numerous papers on meteorology, astronomy, terrestrial magnetism, &c., in the *Mémoires* and *Bulletins* of the Belgian Royal Academy. He died in 1874.

QUETTA (so usually; but more accurately spelt *Kwatah*), a town in Beloochistan (q. v.), strategically important as being near the head of the Bolan Pass, and close to the Pishin Valley. By treaty in 1877, Q. has become a British military station, and commands the southern route from India into Afghanistan. It secures the Pishin Valley, and keeps several passes open. The

valley of Q. lies 5500 feet above the sea, and is surrounded by mountains 5000 or 6000 feet higher still.

QUEVEDO Y VILLEGAS, DON FRANCISCO GOMEZ DE, a Spanish classic, was born at Madrid, 26th September 1580, and studied at the university of Alcalá de Henares, where he acquired a good knowledge not only of Latin and Greek, but also of Hebrew and Arabic, besides French and Italian. His career, which was chiefly that of a diplomatist, was marked by numerous vicissitudes. He died 8th September 1645, at Villa Nueva de los Infantes.

The prose works of Q. are divisible into two classes—the serious and the burlesque. Among the former are his *Vision of St. Paul*, *The Spanish Epictetus*, *Phocylides*, *Fortune become Reasonable*, and particularly *The Life of Marcus Brutus*, and *The Policy of God*—the last two of which are remarkable for the purity and elevation of their sentiments. Among his satirical and burlesque productions, in which his genius finds its happiest expression, the principal are—*The Dream of the Death's Heads*, *The Demon Alguazil*, *Pluto's Stables*, *The Side-scenes of the World*, *The Letters of the Knight of the Porceps*, *Recollections of Student Life*, and *The Grand Sharper*, or *the History of Don Pablo de Segovia*, a romance of rascaldom, a species of fiction much cultivated in Spain at that time, in which the hero is usually an adventurous scamp. The lively sallies, the piquant allusions, and the happy metaphors found in these books, have enriched Spanish literature with a crowd of proverbs and colloquial phrases. Q.'s poetry is also chiefly of a humorous character. His works have been often reprinted; the most complete edition is that by Sancho (Madrid, 11 vols. 1791—1794); a more recent collection is the one by M. Guerra y Orbe (Madrid, 1852). An English translation of Q.'s satirical works was published at Edinburgh in 1798; his *Sueños*, or *Visions*, among the most popular of all his productions, were also translated into English by Sir Roger l'Estrange (1708).

QUIBERON, a small fishing town of France, in the dep. of Morbihan, at the extremity of a long slender peninsula, 25 miles south-west of Vannes. Pop. (1876) 720. It is historically celebrated as the spot where a body of French emigrant royalists, under D'Hervilly and Puisaye, landed from an English fleet, on the 27th of June, 1795, and endeavored to rouse the people of Brittany and La Vendée against the Convention, but were defeated, and driven into the sea by General Hoche. All the prisoners taken were shot, by order of the Convention. At an earlier period, during the war of the Austrian Succession, an English force attempted a landing here (1746), but was severely repulsed. In 1759, Admiral Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay.

QUICKENS. See COUCH-GRASS.

QUICK-MATCH, a combustible match, made by dipping cotton-wick in a composition of vinegar, saltpetre, and sometimes an admixture of gunpowder; when lighted, it continues to burn to the end, and hence it is useful in exploding mines, &c. The rate at which it burns being known, it is only necessary, for insuring safety, to take the right length of quick-match.

QUICKSILVER. See MERCURY.

QUIETISTS, the name of a somewhat numerous class of mystical sects, who, in different ages, have held that the most perfect state of the soul is a state of quiet, in which the soul ceases to reason, to reflect, whether upon itself or on God, and, in a word, to exercise any of its faculties, its sole function being passively to receive the infused heavenly light, which, according to their view, accompanies this state of inactive contemplation. Under the various heads, FENELON, HESYCHASTS, BRETHREN OF THE FREE SPIRIT, MOLINOS, MYSTICISM, most of the details of the doctrines of the Q. have been explained. Some of these are of a purely speculative character, and involving but little of practical consequence, whether for good or for evil. But there is one most pernicious class of errors, which, however, eschewed by the leaders of the various schools, has seldom failed to characterize the practical working of the system among the vulgar crowd of its followers. From the belief of the lofty and perfect nature of the purely passive state of contemplation, there is but a single step to the fatal principle in morals, that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; that good works, the sacraments, prayer, are not necessary, and hardly even compatible with the repose of the soul; nay, that so complete is the self-absorption, so independent is the soul of corporeal sense, that the most criminal representations and movements of the sensitive part of the soul, and even the external actions of the body, fail to affect the contemplating soul, or to impress it with their debasing influence. These results will be found detailed under some of the heads named above. The chief Quietist sects have been the Messalian or Euchites, in the 4th c.; the Bogomili, in the 11th c.; the Beghards and Beguines, in the 13th c.; the Hesychasts, in the East, about the same period; the

Brethren of the Free Spirit, in the 14th c.; Michael Molinos, in the 17th c.; and others of less note.

QUILIMA'NE, a seaport of Eastern Africa, in the Portuguese territory of Mozambique, stands about 15 miles from the mouth of the river of the same name. The town itself, or village, stands on a large, moist mudbank (in any part of which water can be found by digging two feet deep), surrounded by mango-bush and marsh. The climate is unhealthy in an eminent degree. The bar at the harbor is extremely dangerous, and the volume of water is so small, that the bed of the small stream which communicates between the Quilima and the Zambesi (q. v.) is dry for at least nine months in the year. During the dry season, trade is carried on by land-carriage. Pop. about 15,000, including the inhabitants of the country in the immediate vicinity of the town.

QUILLA'IA, a genus of plants of the natural order *Rosaceæ*, the type of a tribe called *Quillaieæ* with herbaceous calyx-tube, capsular fruit, and seeds winged at the apex. The sub-order is remarkable for saponaceous secretions. The barks of some species of *Quillaia*, as *Q. saponaria*, and *Q. Brasiliensis*, are used in South America under the name of *Quillai*, as a substitute for soap. They contain a substance closely allied to *Saponine*.

QUILLED, in Heraldry, a term used in describing a feather, to indicate that the quill differs in tincture from the rest.

QUILLO'TA, a town of Chili, 22 miles north-east from Valparaiso. The richest copper-mines of Chili are in its vicinity. Pop. 12,000.

QUILLS, the large feathers of the wings of birds, the hollow tubes of which, being properly cleaned of all oily or fatty matter, and dried, are used for making pens to write with. The exact time of their introduction to use for this purpose is not known. Those plucked from geese are most generally used, but swan and turkey-quills are not uncommon; and for very fine writing, and for pen-and-ink drawing, crow-quills are preferred to all others. At one time, the collection and preparation of quills formed a very large and important branch of commerce; but the introduction of metallic pens has reduced it to very small limits. The following are the chief kinds sold by the dealers, and the list gives a correct indication of the sources of supply: Swan-quills, Iceland, &c.; English goose-quills, Irish goose-quills, Hudson's Bay goose-quills, Dutch goose-quills, St. Petersburg goose-quills, Riga goose-quills, Turkey goose-quills, British crow-quills, duck-quills for tooth-picks. Our imports amount to nearly 300,000,000 per annum, the value of which is about £250,000. Those of the swan fetch the highest price, or about four guineas per thousand; whilst the best goose-quills rarely exceed 20 shillings. After they have been carefully scraped and cleaned, the drying is effected by gentle heat in ovens, by which they acquire a necessary brittleness in a longitudinal direction. This is important, as, without this property, we could not make the fine slit, upon which the whole working character of the pen depends.

QUILON (*Kayan Kulon*), a town of India, in the state Travancore, 35 miles north-west from Trivandram. It is situated on the sea-coast, in a bight where ships may anchor and have shelter. Q. has a barrack for European troops, a hospital, a jail, &c. There is a considerable export trade in timber, cocoa-nuts, ginger, pepper, &c. The communication with Trivandram is almost entirely by canals, connecting the lagoons of the *back-water*. There is similar water-communications with towns further northward on the coast. Pop. estimated about 20,000.

QUILT'OR, a fistulous wound about the top of the horse's foot, results from treads, pricks, or neglected corns, which lead to the formation of matter underneath the hoof. Any dead horn, matter, or other cause of irritation must be sought for by cutting away the hoof. A free opening must be provided for the egress of any pent-up matter. Poulting for a few days is often useful; whilst healing may afterwards be expedited by the injection of any mild astringent lotion. The powerful caustics so frequently used, cause much unnecessary pain, and often aggravate the evil.

QUIMPER, an old town of France, capital of the department of Finistère, is prettily situated on the Odet, about 9 miles from its mouth, and about 35 miles south-east of Brest. Its cathedral, a stately and richly-carved and ornamented edifice, commenced in 1424, is the principal building. Potteries are in operation, as well as tanyards, breweries, &c.; and sardine-fishing is actively carried on. Pop. (1876) 13,879.

QUIN, JAMES, a celebrated actor of Irish descent, was born in London, 24th February 1693, and made his first appearance on the stage in 1714 at Dublin as Abel in *The Committee*. Shortly after, he proceeded to London, where he was engaged at Drury Lane, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Q.'s being called on to sustain the character of Bajazet in the once famous play of *Tamerlane*. His success was marked. Next year, he exchanged Drury Lane for Mr. Rich's theater at Lincoln's Inn Fields, where he remained as a

principal actor 17 years. Not long after leaving the former place, he had the misfortune to kill a brother-actor, Mr. Bowen, in a duel—a circumstance which clouded his reputation for a while. The only really fine parts which he seems to have played were Captain Macheath in the *Beggar's Opera*, and Falstaff in the *Merry Wives of Windsor*. In 1734–1735, he returned to Drury Lane Theater, 'on such terms,' says Cibber, 'as no hired actor had before received;' and from this date until the appearance of Garrick in 1741, he was, by universal consent, the first actor in England. Q. was by no means pleased at the rising fame of Garrick, and sarcastically expressed his chagrin by declaring that 'Garrick was a new religion, and that Whitefield was followed for a time; but they would all come to church again.' In this, however, he was mistaken. In 1751, he withdrew from the stage as a hired actor, though he continued at intervals to give his services for benevolent purposes, and fixed his residence at Bath, where he died January 21, 1766. In after-dinner conversation, he was a coarse but capital story-teller, and many of his jests are still in vogue.

QUINCE, (*Cydonia*), a genus of trees and shrubs of the natural order Rosaceæ, sub-order *Pomeæ*, nearly allied to *Pyrus*, with which many botanists have united it, but distinguished by having many instead of two seeds in each cell, and by their very mucilaginous nature. The COMMON Q. (*C. vulgaris*), a native of the south of Europe and temperate parts of Asia, is a low tree, with generally tortuous branches; ovate, entire, deciduous leaves, which are downy on the underside; and rather large, whitish flowers, which are solitary at the extremity of young branches. The fruit is in some varieties globose; in others, pear-shaped, of a rich yellow or orange color, with a strong smell. It is hard and austere, but when stewed with sugar, becomes extremely pleasant, and is much used in this way either by itself, or to impart a flavor to apple-pies. It is also much used for making a preserve called *Quince Marmalade*. A delicious beverage, somewhat resembling elder, is made from it. The seeds readily give out their mucilage to water, so that they turn 40 or 50 times their weight of water into a substance as thick as syrup. Q. mucilage, or Q. gum, *Cydonia*, is allied to Bassorin, but differs from it in being readily soluble in water, whilst it differs also in some particulars from Arabin. See GUM.—The Q. was cultivated by the ancient Greeks and Romans, and is at the present day cultivated in the south of Europe, in England, and generally in temperate climates. In Scotland, the fruit seldom ripens except on a wall.—The JAPANESE Q. (*C. Japonica*, better known by its older name, *Pyrus Japonica*), a low bush, a native of Japan, but perfectly hardy in Britain, is often to be seen trained against walls, being very ornamental from the profusion of its beautiful flowers.

QUINCY, a city of Illinois, U.S., on the east bank of the Mississippi River, 160 miles north of St. Louis, is handsomely built on a high bluff, and has a large trade by the river, railway connections with Chicago, Toledo, &c., extensive manufactures, seven banks, eight newspapers, and thirty churches. Pop. (1870) 24,052; (1880) 27,275.

QUINCY, JOSIAH, an American lawyer, orator, and man of letters, and son of Josiah Quincy, a distinguished orator of the Revolution, was born at Boston, February 4, 1772; graduated at Harvard College, 1790; studied the profession of law; took an active interest in politics as a leading member of the Federal party in New England; entered Congress in 1805, where he became distinguished as a ready, earnest, and fervent orator, in opposition to the policy of Jefferson and Madison. He was one of the earliest to denounce slavery in Congress, and declared that the purchase of Louisiana was a sufficient cause for the dissolution of the union. Disgusted with the triumph of the democratic party and the war of 1812, he declined a re-election to Congress, and devoted his attention to scientific agriculture. He became, however, a member of the senate of Massachusetts, and in 1822, judge of the Municipal Court of Boston. In 1823, he was elected Mayor of Boston; and in 1829 accepted the post of President of Harvard College, which he held until 1845. Among his published works are a Memoir of his father, 1825; *History of Harvard University*, 1840; *History of the Boston Athenæum*, 1851; *The Municipal History of the Town and City of Boston*, 1852; *Life of John Quincy Adams*, 1858; *Essays on the Soiling of Cattle*, 1859. Born before the American Revolution, in which his father took an active and distinguished part, he lived to denounce the secession of the Confederate States in 1860, and urged on the war for their subjugation. He died at Boston, July 1, 1864.—His son, EDMUND QUINCY, is a distinguished author and orator, and was an active member of the Abolitionist party.

QUINET, EDGAR, a French author, was born at Bourg, in the department of Ain, 17th February 1803, and studied at Lyon and Paris. He made his literary *début* at the age of 20 by his *Tablettes du Juf Errant*, after which his love of philosophy and mystic reverie led him to Germany. He studied at Heidelberg, and on

his return to France published a translation of Herder's *Ideen zur Philosophie der Geschichte der Menschheit*, so well executed, that Cousin signalized it as *le début d'un grand écrivain*. From this early period dates his intimate friendship with Michelet (q. v.), the result of a community of feeling and belief. Q. was a member of the scientific commission sent to the Morea in 1828, and while there, gathered materials for his *Grèce Moderne et ses Rapports avec l'Antiquité* (Par. 1830). Although his political enthusiasm was extremely ardent, he continued unabated his literary labors, and became a contributor to the *Revue des Deux Mondes*, in which *Ahasuerus*, perhaps his finest work, first appeared. From 1839 to 1842, he held the chair of Foreign Literature at Lyon, where his lectures on the ancient civilizations excited a profound interest. From this situation he passed to the chair of *Littératures Méridionales* at the College of France, expressly instituted for him by M. Villemain; and here, in company with Michelet, he assailed the Jesuits with a keen, earnest, epigrammatic eloquence that startled the chiefs of that body, and made even the government nervous, who knew the peril of being exposed to their secret hostility. In 1846, Q. was silenced. He threw himself eagerly into the Reform agitation that brought about the revolution of 1848, and was elected a member of the Constituent and Legislative assemblies, where he always voted with the Extreme Left; but was expelled from France after the 2d of December. On the fall of the empire, Q. returned to France, and was reinstated in his chair at the College of France, November 1870. In 1871 he was elected a member of the Assembly. He died in 1875. Among his chief works are (*Allemagne et Italie* 1839); *Histoire de la Poésie Epique* (1836–1837); *Le Génie des Religions* (1842); *Les Jésuites*, along with Michelet (1843); *Les Révolutions d'Italie* (1848); *Merlin l'Enchanteur* (1860); *La Campagne de 1815* (1862). An edition of Q.'s *Œuvres Complètes* appeared in 1878.

QUINIA, or QUININE, and the other CINCHONA ALKALOIDS. In the barks of the different varieties of *Cinchona* which are employed in the treatment of disease, several alkaloids or organic bases occur in combination with quinic and quinoctannic acids. Of these bases, the most important are quinia and cinchonina, each of which is accompanied by (or connected with) two isomeric bases, termed respectively *Quinidine* and *Quinicine*, and *Cinchonidine* and *Cinchonine*; and besides these, a base termed *Aricine* or *Cinchovatine* occurs in the bark of *Cinchona ovata*. We shall describe (1) the chemical characters, and (2) the therapeutic action of these alkaloids.

1. *Quinia* ($C_{10}H_{12}N_2O_4$) is characterized by the following properties. It crystallizes with six atoms of water, in the form of silky needles, from an ethereal or alcoholic solution allowed to evaporate spontaneously in a cool place; but when thrown down from acid solutions, it forms a white curdy precipitate. It is comparatively insoluble in water, requiring about 200 parts of boiling water for its solution, but dissolves readily in alcohol and in ether, and in water acidulated with a mineral acid. It has an intensely bitter taste, which is chiefly perceived at the back of the mouth; it has a well-marked alkaline reaction. It combines with acids, and forms both neutral and acid salts, most of which are capable of crystallization, and all of which possess its own bitter taste. Of these salts, the acid ones are far the most soluble.

The most important of its salts is the neutral sulphate, represented by the formula $C_{10}H_{12}N_2O_4 \cdot HO_2SO_4 + 7Aq$. (It was formerly termed the disulphate, till Strecker showed that the correct formula for quinia was $C_{10}H_{12}N_2O_4$, and not $C_{20}H_{12}N_2O_8$.) It crystallizes in long snow-white silky needles, sparingly soluble in water (yet imparting to it a peculiar bluish tint), but dissolving freely in diluted sulphuric acid and in alcohol. The acid sulphate, $C_{10}H_{12}N_2O_4 \cdot 2(HO_2SO_4)$, is also crystallizable, and the crystals, when dried for some time at a temperature of 212° , are phosphorescent. Its solution, or an acidulated solution of the former salt, exhibits the phenomena of *Fluorescence* (q. v.) in a striking manner. On heating a solution of sulphate of quinia with strong acetic acid, and adding, drop by drop, an alcoholic solution of iodine to the hot solution, we obtain crystals of a compound represented by the formula $C_{10}H_{12}N_2O_4 \cdot I_2 \cdot 2(HO_2SO_4) + 10 Aq$. These crystals, which are formed in large flat rectangular plates, present very remarkable optical properties, polarizing light as perfectly as plates of tourmaline.

This alkaloid may be obtained from several species of cinchona, but is most abundant in the yellow bark (*C. Cardifolia*). The pulverized bark is boiled with water containing 1 per cent. of oil of vitriol, which dissolves the bases that are present; the solution is precipitated by carbonate of soda, and the quinia (with the other alkaloids) extracted from the precipitate by ether. For various methods of obtaining the sulphate of quinia on a large scale for medicinal purposes, we must refer the reader to Pereira's *Materia Medica*, 4th edition, vol. 2, part 2, pp. 147–149, and the *British Pharmacopœia*, p. 815. The mother liquid from which sulphate of quinia has been obtained, contains a considerable quantity of a resinous amorphous substance

known as *Quinoidine*, which, when treated with ether, yields crystals of *Quinidine* ($C_{40}H_{54}N_2O_4 + 4Aq$), a base isomeric with quinia, from which again is derived another isomeric base, *Quinicine*.

Cinchonia ($C_{20}H_{26}N_2O_4$) crystallizes in comparatively large quadrilateral prisms, which are anhydrous. It is less soluble in alcohol than quinia, and is insoluble in ether, and this difference of solubility affords the means of separating these two alkaloids. With acids it forms two series of salts similar to, but more soluble than, those of quinia. These salts are intensely bitter, and possess (although in a less powerful degree) the same therapeutic properties as those of quinia. In certain varieties of cinchona bark, a crystalline alkaloid named *Cinchonidine*, isomeric with cinchonia, occurs. On exposing its salts, or those of cinchonia, to a high temperature, corresponding salts of *Cinchonidine* are formed. The last-named substance has the same composition as the two preceding ones, and is precipitated from its salts in the form of a resinous mass. Cinchonia and its isomeric allies are most abundant in the pale Peruvian Bark (*Cinchona condaminia*). The method of obtaining cinchonia is precisely the same as that for obtaining quinia. When both bases are present, they may be separated by converting them into sulphates; the salt of quinia is the least soluble, and crystallizes first.

The relations of the above-described alkaloids to polarized light have been carefully studied by Pasteur, and are very remarkable. Their respective effects on the plane of polarization are as follow: Quinia produces a powerful left-handed rotation; quinidine produces a powerful right-handed rotation; quinicine produces a feeble right-handed rotation; cinchonia produces a powerful right-handed rotation; cinchonidine produces a powerful left-handed rotation; cinchonidine produces a feeble right-handed rotation. The action of these alkaloids thus affords an excellent illustration of the importance of circular polarization as an aid to chemical analysis.*

2. The only preparations of the above-described alkaloids included in the *British Pharmacopœia* are the *Sulphate of Quinia*, the *Compound Tincture of Quinia* (which is merely a solution of the sulphate in tincture of orange-peel in the proportion of one grain to a fluid drachm), and the *Citrate of Iron and Quinia*. Sulphate of quinia is a preparation which, from its expense (about 12 shillings an ounce), is always liable to adulteration; and specimens containing gypsum, chalk, magnesia, gum, starch, boracic and stearic acids, sugar, salicine, and sulphate of cinchonia, are not unfrequently met with. The first five may be detected by their insolubility in alcohol; boracic acid by the green tinge which it gives to the alcoholic flame; stearic acid by its insolubility in dilute acids; sugar by its solubility in cold water; salicine by the addition of oil of vitriol, which turns it red; and the sulphate of cinchonia by precipitating the suspected specimens by liquor ammoniac, and then adding ether, when the quinia will be dissolved, but the cinchonia will float between the two liquids. (This test for cinchonia is recommended by the French government, who refuse to allow the sale of sulphate of quinia containing more than three per cent. of cinchonia.) The most important use of sulphate of quinia is in the treatment of intermittent fever, for which it may be regarded as a specific. Various nervous affections, especially if they assume a periodical character, are successfully treated by it—as, for example, neuralgia, chorea, certain forms of headache, &c. In numerous forms of dyspepsia, debility, and cachexia, there is no single remedy more effectual than the citrate of iron and quinia.

The ordinary dose of the sulphate is from one to three grains, but in ague it may be given in far larger doses.† It may be prescribed in the form of pills made with conserve of roses, or as mixture, in which case a little sulphuric acid should be added to render it soluble. In large doses, as from 10 to 20 grains or more, it excites the nervous system, giving rise to headache, buzzing of the ears, blindness, giddiness—a group of symptoms collectively known as *Quinism*; and several deaths are recorded as arising from its administration in excessive doses. The average dose of the citrate of iron and quinia is 5 grains, which may be given in a glass of sherry. *Quinoidine* (also termed *Amorphous Quinine*) seems to be as efficient a tonic as sulphate of quinia, but not to have so great an anti-periodic power, and hence not to be so serviceable in intermittent fever, &c. *Quinidine* possesses the medicinal properties of quinia. Pereira and other physicians have found that its sulphate is equally serviceable with that of quinia, both as a tonic and a febrifuge; and the action of *Quinicine* is similar to that of quinoidine. *Cinchonia* appears to act precisely

the same as quinia, while *Cinchonidine* and *Cinchonidine* are of little therapeutic value.

Quinia is employed not merely in the cure of disease, but for the preservation of the health, when the system is exposed to certain noxious influences. Its value as a means of guarding the system from the attack of intermittent fever is so generally recognized, that our Admiralty regulations require that every man should take quinia when the ship is within a certain distance of the east and west coast of Africa, and that it should be regularly continued in eight-grain doses every morning to those engaged in boat-cruising along the coasts or on the rivers or creeks. The author of 'A Visit to the Cities and Camps of the Confederate States,' in *Blackwood's Magazine* for January 1865, observes, that formerly it was considered certain death to sleep out for one night on James's Island, opposite Charleston, during the malaria season; when he wrote, thousands of men were quartered on it. In 1863, when the taking of quinia was optional, there was a great deal of fever; in 1864, all were compelled to take their dose regularly every morning, and they were very healthy. It would appear, however, that quinia is not equally efficacious in guarding the system against all forms of intermittent fever, for Mr. Meller, surgeon-naturalist in medical charge of Dr. Livingstone's Zambesi expedition, found a glass of rum given at sunrise to be 'a far better prophylactic' than quinia in the fever of East Central Africa.

QUINISEXT (Lat. *quinque*, five, and *sex*, six), the name given to a council which, being regarded as a sort of supplement of the fifth and six generals, is called by a title which appears to combine both. In the same view, it is called by the Greeks *penthekte* (from *pente*, five, and *hekte*, sixth). The fifth general council, held in 553, on the subject of the Three Chapters (q. v.), enacted no canons of discipline. In like manner, the sixth, held against the Monothelites in 660, was confined almost entirely to doctrinal decisions. In order to supply the want, a numerous body of bishops, 211 in number, assembled in 692, in a hall of the imperial palace at Constantinople, called the Trullus. It was a purely oriental council, and not only was not approved by the Western Church and the pope, but was almost immediately reprobated. Its decrees are purely disciplinary; and it is chiefly important as being the council in which was laid down the broad distinction between the legislation of the East and that of the West, on the subject of clerical celibacy. The Q. council, while prohibiting the marriage of any one who is in priest's orders, permits a married man to receive after marriage the order of subdeacon, deacon, or priest, but not of bishop. Against this, the Roman pontiffs vigorously protested. Another peculiar canon of this synod (57th) prohibits fasting on Saturday, even though in Lent. On these and other points of difference in discipline, no agreement has taken place between the churches down to the present time.

QUINOA (*Chenopodium Quinoa*), an annual plant, a native of Chili and the high table-land of Mexico. It much resembles some of the British species of *Chenopodium* (q. v.), has an erect stem, with ovate, angulate-toothed leaves, the younger ones pulverulent, and panicles much crowded and branched. In the countries in which it is indigenous, it is much cultivated for its seeds, which form the principal food of the inhabitants. The meal made from some varieties of the seed has a somewhat peculiar flavor, but it is very nutritious. Q. meal resembles that of oats in not becoming elastic and tenacious when mixed with water, and like oatmeal, can only be made into cakes, not into leavened bread. The plant is sometimes cultivated in our gardens for its leaves, which are a good substitute for spinach.

QUINQUAGE-SIMA SUNDAY (Lat. fiftieth), the Sunday immediately preceding Ash-Wednesday.

QUINQUENNIAL PRESCRIPTION, a period of five years allowed by the law of Scotland within which payment of sums on all bargains concerning movables, arrears of rent in some leases, multures, ministers' stipends, arrestments, must be enforced.

QUINQUEREMES, vessels with five banks of oars, however arranged (see TRIREME), may be regarded as the first-rates of the ancient navies. The Greek states used them after the death of Alexander, and the Carthaginians a little later. A Carthaginian vessel of this class served during the first Punic War as a model to the Romans, who built 100 on the coast of Bruttini in the year 266 B.C., and thenceforward maintained fleets of such ships. According to Polybius, a quinquereme carried 300 seamen and 120 soldiers.

QUINISY, or COMMON INFLAMMATORY SORE THROAT, known also as CYNANCHE TONSILLARIS and TONSILLITIS, is an inflammatory affection of the substance of the Tonsils (q. v.). The inflammation is, however, seldom limited to these glands, but extends to the uvula, the soft palate, the pharynx, and not unfrequently the salivary glands. The disease usually manifests itself by difficulty in swallowing, and a sense of heat and discom-

* MM. de Vry and Alluard published some time ago a Report, in which they state that the polaroscope reveals the presence of impurities in quinia when too small to be detected by any chemical process.

† Mr. Desvignes (in a *Memoir* communicated on January 10, 1865, to the Royal Medical and Chirurgical Society) advocates the administration of solutions of quinia by subcutaneous injection. The solution he employed was a grain and a half in 15 drops of water, acidulated with a drop of dilute nitric acid. With this he successfully treated several hundred cases of intermittent fever in the district of Tuscany, known as the 'Maremme,' in many of which the use of quinia and arsenic administered in the ordinary way, had failed to effect a cure.

fort in the throat, often amounting to considerable pain. On examination, the throat at first exhibits unnatural redness, with enlargement of one or both tonsils. The uvula is enlarged and elongated; its end either dropping down into the pharynx, and by exciting the sensation of a foreign body, giving rise to much irritation, or else adhering to one of the tonsils. The tongue is usually furred, and the pulse rapid, and there are the ordinary symptoms of that form of constitutional disturbance known as inflammatory fever. The inflammation terminates either in resolution (if the attack is not severe, and yields readily to treatment) or in suppuration, which may be detected by the occurrence of slight rigors, and by the increased softness of the enlarged tonsil. The matter which is discharged has a very fetid smell, and the fetor is often the first indication of the rupture. The pain almost entirely ceases with the discharge of matter, and recovery is then rapid. The disease is usually at its height in about a week after the manifestation of the first symptoms, and it almost invariably terminates favorably. The ordinary exciting cause of this disease is exposure to cold, especially when the body is warm and perspiring; and certain persons (or even families) are so subject to it that slight exposure is almost sure to induce it.

The disease may sometimes be cut short, at its very commencement, a sharp purgative (as, for example, compound infusion of senna with Epsom salts) be administered followed up almost immediately by an emetic of a scruple of ipecacuanha with a grain of tartar emetic. The patient should remain in the house (or in cold weather, even in bed), and should be kept on low non-stimulating diet. A stimulating liniment, such as the compound camphor liniment, should be applied to the outside of the throat, and the neck should be surrounded with a piece of flannel. In mild cases, the above described treatment is sufficient. In more severe cases, the patient may gargle frequently with hot water, or milk and water, or, which is better, may inhale the vapor of boiling water. Blistering and leeching will sometimes give relief, but if suppuration is once established, they do harm rather than good. If the tonsils are very much enlarged, they should be pricked with a lancet made expressly for the purpose.

Dr. Trench, in his *English Past and Present*, gives quinsy (or quinsie, as he spells it) as an example of the gradual recasting of a foreign word into a new English mould. The Greek word *cynanche* was the origin of the French *esquinancie*, which entered the English language as *squinancy*, became *sqinsey* in the time of Jeremy Taylor, and has now softened down to *quinsy* or *quinsy*.

QUI'NTAL, a French weight corresponding to the Eng. 'hundredweight,' was equal to 100 pounds (livres); on the introduction of the metrical system, the same name was employed to designate a weight of 100 kilogrammes (see GRAMME). The metrical quintal is thus more than twice as heavy as the old one, and is equivalent to 220 lbs. avoirdupois.

QUINTANA, MANUEL JOSÉ, surnamed the 'Spanish Tyrants,' was born at Madrid, 11th April 1772, studied at Salamanca, and established himself as an advocate in his native city, where his house became a resort of the advanced liberals of the time. Among his earliest productions were his *Odes*, which gave him a place in the first rank of Spanish poets. On the outbreak of the War of Independence, he made good use of his lyric gift to stimulate the patriotism of his countrymen, and otherwise distinguished himself as editor of the *Semanario Patriótico*, and author of the manifestoes of the insurrectionary juntos, and of most of the official statements of the first Cortes. Meanwhile, he did not abandon literature, properly so called. Besides his Spanish Plutarch (*Vidas de los Españoles Celebres*, Madr. 1807—1834), a work which is reckoned one of the finest Spanish classics, he published one or two tragedies, and an excellent selection of Castilian poetry (*Poesias Selectas Castellanas*, 3 vols. Madr. 1808). On the restoration of Ferdinand VII. in 1814, Q.'s liberalism caused his imprisonment for six years. On his release in 1820, he was received in Madrid with acclamations, and appointed President of Public Instruction. But his enthusiasm in the cause of liberty was now considerably quenched, and in its place appeared a spirit of subservience to royalty which greatly detracted from his previously patriotic character. In 1835 he was reappointed Director-general of Public Instruction, an office which he held till 1851. He was also made a peer and a senator, and acted as tutor to the young queen Isabella from 1840 to 1843. On the 25th of March 1855, Q. was honored with a public ovation in Madrid, had a speech made to him by the Cortes, and a crown of golden laurel placed on his brows by the hand of Isabella herself. He died 11th March 1857. Q.'s works are to be found collected in the *Biblioteca de Autores Espanoles* of Rivadeneyra (Madr. 1852).—See Kennedy's *Modern Poets of Spain*, and Ticknor's *History of Spanish Literature*.

QUINTE'SSENCE (Lat. *quinta*, fifth, *essentia*, essence) signifies literally the fifth essence. The word is of ancient origin, and dates from the time when it was generally believed that the simple

elements or constituents of bodies were four in number, viz., fire, air, earth, and water, and that earth was the lowest element, being grosser than water, water than air, and air than fire. Some Pythagorean philosophers, not satisfied that these four elements or essences sufficed for the composition of all substances in nature, added to them a fifth element or essence, *ether*, which was supposed to be more subtle and pure than fire (the highest of the four), and was therefore located in the uppermost regions of the sky. The word 'quintessence' has thus come down to us in the signification of the most subtle ingredient or extract of any body, though in ordinary language it is employed in a figurative sense. See ALCHEMY.

QUIN'TETT, a musical composition for five voices, or for five instruments, each of which is *obligato*. The most remarkable quintetts for stringed instruments are those of Boccherini, Mozart, Beethoven, and Onslow; and for wind instruments (the flute, oboe, clarinet, horn, and bassoon), those of Reicha.

QUINTILIANUS (QUINTILIANUS, M. FABIVS) was born 40 A.D., at Calagurris (the modern Calahorra) in Spain, and attended in Rome the prelections of Domitius Afer, who died in 59. After this date, however, he revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practise as an advocate, in which capacity his reputation became considerable. He was more distinguished, however, as a teacher than as a practitioner of the oratorical art, and his instructions came to be the most eagerly sought after among all his contemporaries, while among his pupils he numbered Pliny the Younger and the two grand-nephews of Domitian. As a mark of the emperor's favor he was invested with the insignia and title of consul; while he also holds the distinction of being the first public teacher who benefited by the endowment of Vespasian, and received a fixed salary from the imperial exchequer. His professional career as a teacher of eloquence, commencing probably with 69, extended over a period of 20 years, after which he retired into private life, and died probably about 118. The reputation of Q. in modern times is based on his great work entitled *De Institutione Oratoria Libri XII.*, a complete system of rhetoric, which he dedicates to his friend Marcellus Victorius, himself a court favorite and orator of distinction. It was written (as he tells us in his preface to his bookseller Trypho) after he had ceased to be a public teacher; and was the fruit of two years' labor. During its composition, however, he was still acting, in the lifetime of Domitian, as tutor to the grand-nephews of that emperor.

In the first book he discusses the preliminary training through which a youth must pass before he can begin these studies which are requisite for the orator, and he gives us an elaborate outline of the mode in which children should be educated in the interval between the nursery and the final instructions of the grammarian. The second book treats of the first principles of rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while those of the eighth, ninth, tenth, and eleventh are composition (embracing the proper use of figures of speech) and delivery. The last, and, in the author's view, the most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to adopt, the age at which pleading should be begun, and at which it should be left off, and other allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, and the perfect familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences, has always been admired for its correctness and animation. The declamations, amounting to 164, which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs. There is better ground, however for ascribing to him the anonymous *Dialogus de Oratoribus*, often included in editions of Tacitus. The best editions of Q. are those of Burmann (Leyden, 1720); and of Spalding and Zumpt (Leip. 1798—1829).

QUINTIN MATSYS, a celebrated painter of the early Flemish school. He was born at Antwerp about 1460, and is generally known by the name of the Blacksmith of Antwerp, from having followed that trade in early life. The romantic story so long connected with this artist's name, of his having adopted the profession of painting in order to obtain the hand of a painter's daughter, is founded on nothing more authentic than the verses of Lampsonius, affixed to his portrait by Jerome Cock (1510—1570), and the inscription on his monument in the cathedral at Antwerp, 'Conubialis Amor de Muliere fecit Apellem.' The fact of his admission into the painters' fraternity of St. Luke in 1491—1492, is proved by an entry in the register of that body. It appears from two authentic documents that he was alive on 8th July 1580, but had died previous to 12th October 1581. In the works of this distinguished painter, art is exhibited as transitional between the

style of Van Eyck and Rubens—his aim being, without neglecting the accessory details, to give more importance to the human figure, and more unity and effect to the general composition of his picture. Albert Dürer and Holbein thought highly of his works; among them, the best is an altar-piece with two folding-doors or wings, at one time in the cathedral, now in the picture-gallery at Antwerp, and one of the *chefs-d'œuvre* of that collection. It is specially referred to by Sir Joshua Reynolds in his Notes on his Tour through Flanders and Holland. Q. M. was on intimate terms with Erasmus, Sir Thomas More, and Petrus Ægidius. Many elaborate specimens of ornamental iron-work are attributed to this artist; but from the facts connected with his career as a painter, it may be inferred that he merely furnished designs for the works in iron referred to.

QUINTIN, or QUINTAINE, was an instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post, surmounted by a cross-bar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that the rider was past before the bag of sand, as it whirled round, could hit him on the back.

QUINTUPLET, in Music, a rhythmical group of five notes, formed of a note divided into five instead of its proper complement of four parts; the five notes having collectively the value usually expressed by four such notes. Thus, the five semiquavers of the group are equivalent in value to one crotchet, or four ordinary semiquavers.

QUINTUS CURTIUS RU'FUS, the Roman historian, flourished probably in the time of Vespasian; while a less plausible conjecture represents him as having lived in the reign of Constantine. Nothing further is known, or can even be fairly surmised regarding his life. His work entitled *De Rebus Gestis Alexandri Magni Regis Macedonum*, consisted of ten books; but of these the first two are lost, and the other eight are occasionally imperfect. Its style is flowing and ornate, but it wants the pure Latin of Cicero, and the simplicity of Caesar. Along with the Greek history of Arrian, it forms our most valuable source of information respecting the military career of Alexander the Great, although it is not entirely free from geographical, chronological, and strategic blunders. The best edition is that of Zumpt (Brunswick, 1849).

QUIRE (Fr. *cahier*), of paper, consists of twenty-four sheets, each doubled once, and one placed within the other.

QUIRINUS was, among the Sabines (and according to Mommsen, among the Latins also), a surname of Mars, and is probably derived from the Latin word *quiris*, a spear. It is therefore equivalent to the 'Spear-bearer.' According to the ancient legend, the name was first given to Romulus (q. v.), as the son of Mars, after his apotheosis, and the festival instituted in his honor was called the *Quirinalia*.—The QUIRINAL (Lat. *Collis Quirinalis*), is one of the seven hills on which ancient Rome stood, and, next to the Palatine and Capitoline, the oldest and most famous quarter of the city. It lies due north of the Palatine, and its western slope looks down on the Campus Martius, which stretches from its base to the banks of the Tiber. According to the ancient legend, it was the seat of the Sabine portion of the mixed population of early Rome; but this idea is strongly combated by Mommsen, who rejects as a 'baseless speculation' the 'etymologico-historical hypothesis started by Varro, and, as usual, unanimously echoed by Latin writers, that the Latin *quiris* and *Quirinus* are akin to the Sabine town *Cures*, and that the Quirinal Hill accordingly had been peopled from *Cures* (*History of Rome*, vol. i.). The most notable structures on the Quirinal were *The Temple of Quirinus*, said to have been built by Numa in honor of Romulus, *The Temples of Flora, Salus, Fortuna, and Sol*. Here, also, were the famous Gardens of Sallust (*Horti Sallustiani*), the *Circus Flora*, the *Circus Sallustii*, the Baths of Diocletian, and the Prætorian Camp.

QUIRK, a small angle or recess between mouldings. It is much used in Greek and Gothic architecture, and sometimes in Roman.

QUISCALUS, a genius of birds of the family *Sturniæ*, having the tail longer than in the starlings (*Sturnus*), and graduated—the middle feathers longest—its sides turned up. From this last character, some of the species are often called BOAT-TAIL. The Great Boat-tail, or Great Crow Blackbird (*Q. major*), a bird about 16 or 17 inches long, is common in the southern parts of North America.—More common, and indeed abundant in all parts of the United States, is the PURPLE GRACKLE, or CROW BLACKBIRD (*Q. versicolor*), a bird about twelve inches in length, tail included; black, with reflections of blue, violet, &c. Vast flocks of this species are to be seen at the seasons of migration in some parts of North America. Its migrations extend to very northern regions in summer. It is to be found in Louisiana at all seasons. Its depredations in fields of maize and other kinds

of grain, make it an object of special dislike to North American farmers. Its flesh is dry and coarse, although often used for food; but its eggs are esteemed a delicacy.

QUITCH. See COUCH GRASS.

QUI TAM actions are actions so called in the law of England from the first words of the old form of declaration by which informers sue for penalties, the plaintiff describing himself as suing as well for the crown as for himself, the penalty being divided between himself and the crown.

QUI'TO, the capital of Ecuador (q. v.), and of the province of Pichincha, stands between two parallel ranges of the Andes, on the east side of the volcano of Pichincha (q. v.), at an elevation of 9492 feet above the sea, and in lat. 0° 15' S., long. 78° 45' W. Its site, in the midst of mountains, is very uneven; its appearance, however, is picturesque, and its beautiful environment of mountains, together with its clear, healthy, and temperate climate, averaging 60° Fahr., and described as an eternal spring, make it one of the most charming cities of South America. From the hills in the vicinity, a beautiful panoramic view, embracing eight icy peaks of the Andes, may be obtained; and to the south of the city extends the lovely valley of Chillo, laid out in gardens. The chief edifices are built of stone, the others of adobes, or sun-dried bricks, covered with tiles. Q. contains many churches, monasteries, convents, two hospitals, two colleges, and several plazas or squares. By the earthquake of March 1859, most of the then existing churches, convents, and government buildings, as well as many private residences, were thrown down, property to the value of 3,000,000 dollars was destroyed, and many lives lost. From this calamity, the city has in great part recovered. Q. is the seat of the only archbishop in the country, and of the government. Coarse cotton and woollen goods and jewelry are manufactured, and the trade in grain, indigo, metals, and liquors is extensive. Pop. 76,000.

The most important events in the history of Q. are mentioned in the articles ECUADOR and PERU (q. v.).

QUIT RENT is the small rent which is payable by the tenants of old manors, by which they go *quiet* and free. In old records, it is called *white* rent, because it was paid in silver money, as distinguished from corn rents.

QUOIN (Fr. *coigne*, from Lat. *cuneus* = Gr. *gonia*) is generally a wedge or an angle. In artillery, the quoin is a wedge inserted beneath the breech of a gun, for raising or depressing the muzzle. The Armstrong gun is elevated by a screw instead of a quoin; but considering the rough service of actual warfare, it is doubtful whether the clumsier quoin is not more to be depended on. Quoins on shipboard are wedges used to prevent casks from damaging each other.

QUOIN, in Architecture, is one of the stones forming the solid corner of a building. Where the work is of brick or small materials, the quoins are usually of ashlar. They sometimes project, and are moulded, when they are called 'Rustic Quoins.' See RUSTICATION.

QUOITS, a game much practised by the working classes in the mining districts of Great Britain, seems to have been derived from the ancient game of 'throwing the *discus*,' which was such a favorite amusement of the Greeks and Romans. The *discus* was a circular plate of stone or metal, 10–12 inches in diameter, and was held by its further edge with the right hand, so as to lean upon the fore-arm, and was cast with a swing of the arm, aided by a twist of the whole body. It was generally thrown edge foremost, and upwards at an angle of 45°, so as to give it as great a range as possible, and the player who threw it furthest was the winner. Similar to this game was the 'throwing of the *solos*,' a heavy spherical mass of stone or iron, perforated through the center, to admit a rope or thong, by the aid of which it was thrown. In this game also, the furthest throw was the successful one. It is still practised by the mountaineers of the Appenzell, in Switzerland. The game of quoits differs very considerably from both of these.

A quoit is a flattish ring of iron, generally from $\frac{3}{4}$ to 9 $\frac{1}{4}$ inches in external diameter, and between 1 and 2 inches in breadth. It is convex on the upper side, and slightly concave on the under, so that the outer edge curves downwards, and is sharp enough to stick into the ground. The mode of playing is as follows: Two pins, called 'hobs,' are driven into the ground from 18 to 24 yards apart; and the players, who are divided into two parties, stand at one hob, and in regular succession throw their quoits (of which each player has two) as near to the other hob as they can. The points are counted as in bowls or in curling. To facilitate the sticking of the quoits at the point where they strike the ground, a 'clay end'—that is, a flat circle of clay, about 1 or 2 inches in thickness, and $\frac{1}{4}$ feet in radius—is placed round each hob. This requires to be kept moist, and should have sawdust strewn over it. The quoit, when to be thrown, is grasped with the right hand by one side, and pitched with an upward and forward jerk of the

hand and arm, which give it a whirling motion, and cause it to strike the ground with its edge. Professional players acquire such dexterity in this game, that they can very frequently 'ring' their quoit—that is, land it so that the quoit surrounds the hob.

QUO'RA. See NIGER.

QUO'RUM (Lat. *quorum*, of whom) is a legal term, denoting a certain specified number out of a larger number as entitled or bound to act for certain purposes. Thus, in statutes appointing commissioners or trustees of a public work, it was usual to name a certain number of the whole body as sufficient to discharge the business, when it may be inconvenient for all to attend. In Scotland, the word is commonly used in reference to trustees appointed under trust settlements, when one or two individuals, either in point of number, or for some personal reason, must concur in formal acts. In England the word is now seldom used except in regard to justices of the peace. It was an ancient practice of

the crown to select a few of the justices, generally the most skilled in the law, and designate them as 'of the quorum,' so as to secure their presence on certain occasions when peculiar business requiring skill was to be done. This selection, however, by degrees came to be considered invidious; and by statutes of George II. and George III., it was expressly enacted that things which formerly required to be done only by justices of the quorum, might be done by ordinary justices. And laterly, the crown has made all the justices justices of the quorum, so as to put them all on the same footing.

QUOTIDIAN FEVER. See AGUE.

QUO' WA'RRANTO is a writ or information issued from the Court of Queen's Bench in Westminster, calling upon a person or body of persons to show by what warrant they exercise a public office or privilege. It is the legal mode of remedying any usurpation of privilege or of office.

R.

THE eighteenth letter in the English and other Western alphabets, is one of the group of liquids. See LETTERS. Its name in Hebrew was *Resh*, meaning forehead, and the rude outline of a head is thought to be yet recognizable in the Phœnician form of the letter. Of all the consonants, R. approaches most nearly to the vowels. In Sanscrit, there is an R-vowel distinguished from the R-consonant by a different character. The Greek also had two varieties of R, one with the 'spiritus asper' (ρ), or rough breathing, at the beginning of words, and when following another R; and another with the weaker breathing (ρ) in other positions. The Romans in spelling Greek words represented the former by *rh*, and hence we still write *Rhodes*, *rheumatism*, *catarrh*. This *rh* was probably of the guttural kind commonly called a 'burr.' This pronunciation of *r* occurs as a peculiarity of individuals everywhere, but it is universal in Northumberland and Durham, and characterizes the pronunciation of the letter in certain positions throughout Germany and Scandinavia. The normal pronunciation of R in English and in the Romanic tongues (and it appears to have been the same in Latin) is a vibratory sound produced by applying the tip of the tongue near the roots of the upper fore-teeth. From the resemblance to the growl of an angry dog, R was called by the ancients the dog's letter.

In modern English, there is an increasing tendency to smooth down the roughness of the vibration, until, in such words as *far*, *serf*, *world*, the *r* has dwindled to a kind of nondescript vowel, modifying the preceding vowel. This emasculating process—for such it undoubtedly is—is in so far only the operation of the universal law of phonetic decay, arising from the natural tendency to spend as little energy as possible; but it has been accelerated in this case by a fashion which is apt to mistake languor and indifference for refinement. This affectation goes so far as to turn words like *very*, *rare*, into *veery*, *waano*. R is one of the most difficult articulations; children are long in learning it, and some individuals never can pronounce it. Whole nations (e. g., the Chinese and some Polynesian tribes) have no such consonant in their language, using *l* instead. The interchanges of *r* with *l* are noticed under L. A more remarkable substitution is that of *r* for *d*, which was very prevalent in early Latin, as we learn from Priscian and from inscriptions. Ex. *arvocatos* for *advocatos*. The Latin of the literary period had returned from this corruption, except in *arbitr* (from an old verb, *adbitere*, to go to, to intervene), *arcesso*, and *meridies* (for *medidies*, from *medius*). The substitution is easily accounted for, when we consider that in both sounds the tongue is applied to the same part of the palate; only in the one it is applied firmly; in the other, loosely, so as to vibrate.

A very common phenomenon, especially in Latin, is the sinking or degradation of an original *s* between two vowels into *r*. On inscriptions, we find *Lases*, *asas*, *esum*, for what at a later period was written *Lares*, *aras*, *eram*. *Jus mos*, became in the genitive *juris*, *moris*, instead of *jusis* *mosis*. Even final *s* was sometimes degraded to *r*, as in the double forms, *arbor* = *arbos*, *honor* = *honos*. Curiously, we know the date when the tendency to change *s* between the two vowels into *r* set in; for Cicero remarks that L. Papirius Crassus, who was consul in 336 B.C., was the first that was called Papirius, the ancestral name having been Papisius.

The interchange in question occurs also to some extent in the Teutonic tongues. Compare Eng. *forlorn* with *lose* (Ger. *verlieren*), *was* with *were*; Ger. *wesen* (to be) with *war* (was); Goth. *hausjan* with Ger. *hören* (to hear); Eng. *hare* with Ger. *hase*. The unstable nature of this articulation is manifested in its frequently changing its place with regard to an adjoining vowel; compare *board* with *broad*; *bird* with old *brid*; *grass* with A.-S. *gars*.

RA. See EGYPT.

RAAB (Hung. *Győr*) a town of Hungary, stands on an extensive plain at the confluence of the Raab and the Little Danube, a branch of the great river of that name, 67 miles west-north-west of Buda. It consists of an inner and outer town, is regularly built, and for the most part well paved, but suffers from an insufficient supply of drinking-water. It contains numerous religious edifices, among which is a beautiful cathedral. The manufactures are chiefly tobacco and cutlery; and the trade of the town, favored by its position on the highway between Vienna and Buda, is important both by land and by steamers on the river. Pop. (1880) 20,981.

RAA'LTE, a cantonal town of the Netherlands, in the province of Overysse, 11 miles north-north-east of Deventer. Pop. (1875) 5512, of whom one-fourth belong to the Reformed Church, and the remainder, excepting 61 Jews, to the Roman Catholic. The trade is chiefly in agricultural produce, cattle, wool, wood, and bark for tanning. R. is one of the prettiest places in the province, having many beautiful houses, and in the neighborhood, seats of the nobility. Hans Willem, Baron van Bentinck, the founder of the ducal house of Portland, was born at R. in 1651.

RAA'SAY, one of the Western Isles, belongs to the group of the Inner Hebrides, and lies between the Isle of Skye and the mainland; the sound of Raasay separating it from the former, and Applecross Sound from the latter. It is 13 miles in length by 2½ miles in greatest breadth. Pop. was in 1871, 389; and in 1881, had risen to 478. The western side of the island is bare and uninteresting. On the eastern and more sheltered side, there are numerous farms, some patches of plantation, and bold and striking scenery. Brochel Castle, on the east shore—now a mere ruin—is the chief object of interest on the island. It is perched on the summit of a lofty cliff, which beetles over the sea, and is entirely inaccessible, save by a pathway winding around the cliff.

RABA'T, or RABATT, a seaport and manufacturing town in the kingdom of Fez, Morocco, stands at the mouth of the Bu-Regreb, 135 miles south-south-west of the entrance to the Strait of Gibraltar. It is surrounded by walls; protected by batteries, and by a citadel, called *El-Mansur*; and contains numerous mosques, minarets, bazaars, &c. Owing to the silting up of the mouth of the river, the commerce of R. has much declined. Manufactures, however, of carpets, bournus, woollen fabrics, waterproofs, mixed linen and silk goods, saddlery, &c., are actively carried on. R. was formerly the center of the European trade with Morocco, and it still exports olive oil, wool, grain, oranges, hides, flax, and dyestuffs, wax, &c. There is a small import of cotton-stuffs, linen, cutlery, glass, sugar and tea. Value of imports (1874) £11,000; of exports, £5400. Pop. 20,000, of whom 2000 are Jews.

RA'BRA, a flourishing town of Africa, in the kingdom of Gando, stands on the left bank of the Niger, 80 miles above Egga, in lat

9° 16'. The district by which it is surrounded is beautiful and highly cultivated. R. carries on an extensive general trade, and is the most notorious slave-market in this part of Africa. Estimated pop., 40,000.

RA'BBI (Heb., *My Master*), an honorary title of the Jewish Masters of the Law, which is first found applied after the time of Herod, subsequently to the disputes between the two schools of Shammai (q. v.) and Hillel (q. v.). It was in common use at the time of Christ, who is addressed as such by his disciples and the common people. Other forms of the same title are Rab, Rabban, Rabbon, ('Rabbuni')—the first, like rabbi, being more a general term for a certain recognized authority, the latter applying more strictly to a head of an academy. The title Rabban, was first given to the grandson of Hillel, Gamaliel (q. v.), and was only borne by seven other exalted chiefs of schools. Properly speaking, the following dignities alone were of old considered 'official'; 1. *Sopher*, scribe, one who occupied himself with copying and commenting on the Scriptures, and who, when elected to the Sanhedrim (q. v.), received the title of Chacham (Sage); 2. *Rabban*, Nonodidaskalos, one who held popular orations, homiletically or otherwise treating of the Law. Out of the number of the regular disciples (Talmidim) were chosen the Chaberim (Colleagues), who, again, were elected to the dignity of a rabbi by the 'Senichah,' or imposition of hands by three members of the Sanhedrim. At present, nothing but the degree of 'Morenu,' our Teacher, bestowed upon a candidate who proves his erudition in the written and oral Law and all its bearings before a college of rabbis, is wanted to render him eligible for the post of a rabbi, which, however, carries no authority whatsoever with it, save on a very few ritual points.

We need hardly allude to the popular fallacy of the rabbi of our day being a kind of 'priest' in the sense of the Old Testament. He is simply the teacher of the young, delivers sermons, assists at marriages and divorces, and the like, and has to decide on some ritual questions. Up to the times of the removal of the 'Disabilities' in Europe, he had on some occasions also to give judgment in civil matters, in accordance with the 'Choshen Mishpat,' a legal text-book, derived from the Talmudical and post-talmudical authoritative decisions.

RABBIT (*Lepus cuniculus*), an animal of the same genus with the hare, but of smaller size, and with shorter limbs, the hind-legs shorter in proportion. It is not adapted, like hares, to seek safety by rapid and continuous running, but by retreating to burrows, which it excavates with great dexterity. Except in some varieties, which result from domestication, the ears are only about as long as the head. The wild R. is of a grayish-brown color, paler or whitish on the under parts; the ears not tipped with black, like those of the common hare; the tail rather larger and more conspicuous—brown above, white beneath. The R. exhibits a remarkable difference from the hare in its gregarious

Tame Rabbits.

habits; and another in the comparatively imperfect state of the young at their birth, which are blind for some days, and are almost destitute of hair. It delights in sandy heaths, dry grounds covered with scattered furze or juniper, and other such situations; to which, however, it is by no means restricted, and is often very troublesome by its depredations on crops in the finest fields, having its abode in some neighboring wood, but it never makes its burrow in a wet soil. Although now very abundant in most parts of Britain, and generally throughout Europe, the R. is said to have been introduced into Britain from Spain, and even to have been originally brought to Europe from the north of Africa.

In a wild state the R. is monogamous, and the attachment of a pair is said to continue during life; but in a state of domestication it ceases to pair. The fertility of rabbits is proverbial; they begin to breed when six months old, and are capable of producing several litters in a year, of 4 to 12 or more in a litter; so that, in favorable circumstances, they multiply with prodigious rapidity;

and although they have many natural enemies, would in many places become an intolerable pest to farmers, were not means adopted to reduce their numbers. Rabbits often inflict great injury on plantations by barking young trees, seeming to take pleasure in tearing off far more than they can eat. An infusion of tobacco repels them from trees. The flesh of rabbits is in high esteem, and the fur being used for various purposes, rabbit-warrens are found profitable in lands not suited for agriculture. See RABBIT-SKINS.

Instances have occurred of the R. and hare breeding together, but they are very rare, and the creatures seem rather to regard one another with antipathy.

Tame rabbits exhibit great variety of colors—gray, brown, reddish-black, more or less mixed with white, and often white, with all the characters of albinism. Peculiarities of other kinds also appear in some of the varieties, among which excessively long and drooping ears are one of the most remarkable. *Fancy Rabbits* are prized and tended like *fancy pigeons*. But when rabbits are kept for economical purposes, those which differ less widely from the original type are preferred. Rabbits eat almost any kind of vegetable food; the coarser blades of cabbages, turnip-leaves, celery-tops, carrot-tops, and other produce of the garden, not suitable for human use, are readily consumed by them, as well as chickweed, sow-thistle, dandelion, and many other weeds. With very little trouble, and still less expense, a man can easily secure one or two rabbits a week for his family from the produce of his stock.

When the rabbit-enclosure contains a plot of grass and clover, it affords them an important part of their food. Great care is requisite to keep their boxes dry, neglect of which, and a too exclusive feeding with green and succulent food, cause diseases, often fatal, particularly to the young. Dry food, such as corn, ought to be frequently given; and aromatic herbs—such as parsley, thyme, milfoil, &c.—not only tend to preserve the health of rabbits, but to improve the flavor of their flesh. It is usual to give no water to tame rabbits; but it is better to supply them regularly with it, and the females particularly need it after producing young.

An old English name for the R. is *cony*, but the R. is not the Cony (q. v.) of Scripture. The R., introduced from England into the Australasian Colonies, has multiplied to such an extent, as to be a serious plague to sheep farmers and agriculturists in New Zealand and some parts of Australia. Of late, rabbits have been extensively tinned and sent to England as food.

The *Angora R.* is a remarkable variety, with very long silky hair, which is easily stripped off in summer. It is regularly reared in France.

The Gray R. (*Lepus sylvaticus*) of North America is the most plentiful species of the genus *Lepus* in New Jersey, Pennsylvania, and the more southern states; but although it somewhat resembles the common R. in color, and is rather inferior to it in size, its habits are intermediate between those of the R. and of the hare. It does not burrow, although, when hard pressed by a pursuer, it retreats into any accessible hole, and sometimes digs, in order to escape from or enter an enclosure.

RABBITS, in point of law, give rise to many nice questions, which in practical life are of no small importance, for they form a branch of the Game Laws (q. v.). In England and Ireland, the law till 1880 was, that whoever is owner of the soil is entitled to catch and kill all the rabbits he finds upon it, without any game license. As between landlord and tenant, the rule was, that unless the lease expressly said that the rabbits belonged to the landlord, they belonged to the tenant, who could kill and catch them at discretion. The Ground Game Act of 1880 largely altered the presumptions in law on this subject. Now the occupier of land has, as incident to and inseparable from his occupation, the right to kill and take ground game, that is, hares and rabbits, thereon, concurrently with any other person who may be entitled to kill and take ground game thereon. The occupier may authorize in writing one other person to kill ground game, being a member of his family dwelling on the land, a servant, or any one hired for reward. Such persons require no game license, but must have the gun license. No person qualified under this act shall use firearms to kill ground game between the hour after sunset and the hour before sunrise. If any one trespass on land to kill rabbits, he is liable to be fined £5; and he may be arrested, if caught in the act on the lands, and detained, provided he do not tell his name and address, and quit the land. The rabbits which he has poached cannot, however, be taken from him, except when he is on the highway, and then only by a constable.

In the latter case, viz., where the poacher is stopped on the highway by a constable, he cannot be taken into custody, but merely is liable to be summoned before justices, and fined. Poachers who take rabbits in the night-time now commit an indictable offence, and not merely an offence which justices can punish summarily. There is no close-time as to rabbits, and any person may buy and sell them without any license. In Scotland

also, the tenant was heretofore entitled to kill rabbits unless there was an express reservation of them to landlords; and the provisions of the Ground Game Act of 1880 apply to Scotland as to England. Poachers of rabbits are punished summarily in the same way; and constables on highways may stop poachers as in England. The only difference between the law of England and Ireland is, that in Ireland a game license is not required in any case for killing rabbits, whether the lands are the sportsman's own lands or not. See also GAME, POACHING.

RABBIT-SKINS have a regular commercial value in consequence of the hair being well adapted for felting purposes; hence they are collected in large numbers by the chiffonniers of this and other countries; and the hair itself is not unfrequently imported from Holland and Germany, under the erroneous name of 'cony-wool.' Its chief use is in making the bodies of felt hats; and this is now done by machinery of very ingenious construction. It consists of a hollow cone of copper, of the size of the felt cones required by the hatters. The cone is covered with perforations, and it fits on to a metal shaft of the diameter of its base, by means of a collar, which can be turned round by a band, so as to carry the perforated cone with it. At the bottom of the metal shaft is a fan, moved by machinery, which produces a strong downward draft, so that if the hairs are thrown against the cone, they are held tightly by the current of air through the perforations; and as the cone regularly revolves, its outer surface becomes entirely coated with the rabbit-hair. When a sufficient thickness is obtained, the smooth copper cone is easily drawn out, leaving a cone of wool, which is felted by the usual processes of wetting, beating, &c. Another ingenious contrivance in this machine is to make the draft of air caused by the fan blow the rabbit-fur forward to the cone, so as to distribute it with an evenness which could not otherwise be attained.

The skins, after the hair has been removed from them, are sold to the glue-makers, and are used—mixed with shreds of other skins—in the manufacture of glue and size. Besides these uses, the skins of rabbits are dressed as furs, in various ways, to supply the demand for cheap articles; and so skillfully is this branch of trade carried on, that admirable imitations of the rarer and more costly furs are made. Thus, ermine and miniver are made from white rabbit-skins, the black ones furnishing the spots; and the common variety is dressed and dyed various ways, to represent the furs of dark-colored animals. In the reign of Henry VIII., rabbit-fur was valued very highly, and was worn by the nobles of the realm; this is referred to in the charter of the Skinners' Company.

There has been a very large market in the United States for the imitation furs prepared from rabbit-skins, to which country British manufacturers have largely exported.

RABELAIS, FRANÇOIS, the greatest of French humorists, was born, according to the general statement of biographers, in 1483, but more probably towards 1495, at Chinon, a small town in Touraine. His father, Thomas Rabelais, was proprietor of a farm in the neighborhood, celebrated for the quality of its wine, the sale of which he perhaps combined with the business of an apothecary. His prosperous circumstances enabled him to give to his son every advantage of education, and at an early age, the boy was sent as a pupil to the neighboring Abbey of Seully. His progress in his studies being found by no means satisfactory, he was thence removed to the university of Angers. Here—though as a scholar he still remained quite undistinguished—he was fortunate enough to make the acquaintance of Jean (afterwards the celebrated Cardinal) Du Bellay, to whose study and helpful friendship he was subsequently much indebted.

At the desire of his father he consented to embrace the monastic state, and after passing through the preliminary novitiate, became a brother of the order of St. Francis, in the convent of Fontenay le Comte, according to the annalist, Pierre de St. Romuald, in 1511, but the discovery of a document by M. B. Fillon (*Poitou et Vendée*, Fontenay, 1861), renders the date 1519 more probable. R. now devoted himself with the utmost ardor and perseverance to the prosecution of his hitherto neglected studies. Aiming at the widest culture attainable, he ranged the whole circle of the sciences as then understood. To medicine, in particular, he seems to have been strongly attracted; and in the sphere of language, in addition to Latin and Greek, he is said to have attained a competent mastery of Italian, Spanish, German, English, Hebrew, and Arabic. Meantime, with his brother-monks, he was much the reverse of a favorite. They hated him for his devotion to the new learning, and suspected his Greek to be only a cover for heresy. About 1523, a search was made in his cell for suspicious books; the whole were confiscated, and to save himself from further and sharper persecution he fled. But though only a poor monk, the wit and learning of R. had gained him several influential friends, through whose exertions he obtained from Pope Clement VII. an indulgence to transfer himself from the order of St. Francis to that of St. Benedict, and became an inmate of the monastery of

Maillezais. For the calumny afterwards circulated, that his removal was necessitated by the odium attached to a life of profligate indulgence, there seems no reason to suppose that there ever was the smallest ground.

We must infer that in his new abode he found himself not much more comfortable than before, as after a few years he quitted it abruptly, without the sanction of his ecclesiastical superiors, thereby incurring the severest censures of the church. But it was not persecution that induced this second flight from the monastic state. It was the incurable aversion of the grotesque humorist to the restraints of the 'regular' clergy. And nobody seems to have really blamed him for his professional apostasy—his own bishop, among others, receiving him at his table in the most friendly manner! During 1524—1530 he appears to have frequented the universities of Paris and Bour; which may account for the intimate knowledge of university manners and opinions shown in his great work. In the year 1530, he settled at Montpellier, and taking a medical degree at the university, was appointed to the post of lecturer. In 1532 he went as hospital physician to Lyon, where he published several works on medical science, besides other miscellaneous matter bearing on archaeology, jurisprudence, &c. In the beginning of 1534, his old friend, Jean Du Bellay, then Bishop of Paris, and shortly after to be Cardinal, passed through Lyon, on an embassy to Rome, whither, in the capacity of traveling physician, R. was delighted to accompany him, in fulfilment of a desire long cherished. While at Rome, he petitioned Paul III. for a remission of the penalties still attached to his misdemeanor before mentioned; and through the interest of Du Bellay and others, a bull was obtained, absolving him, and permitting his return to the order of St. Benedict. But he continued the exercise of his profession of medicine at Montpellier and other towns till 1538, when he withdrew as canon into Du Bellay's own abbey of St. Maur des Fosses, near Paris, and resumed his monastic habit.

The death of Francis I. in 1547, was followed by the fall of Cardinal du Bellay, the new monarch, Henry II., favoring the Cardinal de Lorraine. R. shared for a time in the disgrace of his old protector, whom he appears to have followed to Rome, but his tact and irresistible humor won him friends among the Lorraines, and in 1551 he obtained the curacy of Meudon, in the occupancy of which the remainder of his life was passed. So far as record remains of it, his life here was happy and blameless. He was exemplary in the fulfilment of duty, profuse of charity, sedulous in the relief of suffering, for which his medical knowledge afforded him unusual facilities; and always specially delighted to cultivate, as occasion served, the society of those any way noted as eminent in learning or science. He died at Paris, in 1553, in the Rue des Jardins, in the parish of St. Paul, in the cemetery of which he was buried.

The scientific treatises of R. are—almost in the nature of the case—long since utterly forgotten; but his romance, in which are narrated the wonderful adventures of Gargantua and Pantagruel, continues to take rank as one of the world's masterpieces of humor and grotesque invention. In the form of a sportive and extravagant fiction, it is, in fact, a satirical criticism of the corrupt society of the period, the prevalent follies and vices of which are parodied with surprising effect and ingenuity.

The difficulty of its allegorical form, however, and the quantity of recondite allusion it embodies, tend somewhat to impair the effect of the work for most modern readers. Also, it must be said, that in his attempt to

cleanse the foul body of the infected world,

it is the whim of the writer to infect himself with not a little of its foulness; and such is the riotous license of the buffoonery, from behind which, as a stalking-horse, he shoots the arrows of his wit, that few books are less fitted for general perusal in the present more decorous times. On the publication of his work, the charge of irreligion and atheism were freely preferred against R., and certain other scandals were circulated, for which there seems to have been in his life no foundation, except as the free tone assumed by the writer might suggest a precarious inference to defective morality in the man. The religious corruptions of the time, and the vices of the priestly class, had formed one favorite theme of his satire, and he simply paid the usual penalty in this incurring the easy retort calumnious. See Delécluze *Rabelais*, (1841); Lacroix, *R. sa Vie et ses Ouvrages* (1859); Fleury, *R. et son Œuvre* (1876). The editions of R. are innumerable. Sir T. Urquhart's English translation (1653) is the basis of the more modern ones.

RA'BIES, the name given to a disease affecting the dog and other animals, was known to the ancients, and is spoken of by Aristotle, Pliny, and Horace; but it does not seem to have been then so virulent in its nature, or alarming in its consequences, and Aristotle, perhaps in ignorance, states that man was not subject to its attacks. It was very prevalent on the continent two or three centuries ago, but was comparatively rare in this country

until the last century. This malady stands almost alone in this, that all animals seem liable to its attacks.

It is a matter of dispute among some of our best authorities whether rabies be occasionally *spontaneous* in the carnivora—the only animals in which it is undoubtedly inherent—or communicated solely by *inoculation*.

Looking simply at the *history* of the disease, the facts would seem to be against the spontaneity theory. Rabies is not known in some countries, such as the Cape of Good Hope, South Africa, Egypt, Syria, the South Sea Islands, Lisbon, where dogs swarm; and in Constantinople, where they go at large, and support themselves on offals of all kinds and qualities, the disease is of very rare occurrence. John Hunter relates that it was not known in Jamaica for forty years previous to 1783, when it was introduced by an affected dog from America; and Dr. Hamilton says that cures of the most wretched description abound in the island of Madeira—that they are affected with almost every disease, tormented by flies, by heat, thirst, and famine, yet no rabid dog was ever seen there. There is often, no doubt, great difficulty in tracing the cause of rabies from inoculation. The owner may feel convinced that his diseased dog had almost never been out of his sight, or exposed to an affected animal; but when we consider the predatory habits of the dog, and his love of association, and how easily he can steal away unobserved by night or by day for a longer or shorter time, we can readily account for the most vigilant eye being occasionally off its guard. It has been asked, as an objection to the exclusiveness of contagion or inoculation, How was rabies at first originated? But the same difficulty attends the case of small-pox and other diseases which now arise only from contagion.

There is another important peculiarity in this disease on which medical men are divided—viz., whether the virus of a rabid animal, other than of the *carnivorous* species, can communicate the disease. Experiments to test this were made by some foreign surgeons of eminence, by Drs. Vaughan and Babington of London, and at the Royal Veterinary College; and it is reported that in every instance they failed in producing the disease. It is certain, however, that others have not so failed in their object. MM. Majendie and Brechet in 1825 inoculated two dogs with the saliva of a hydrophobic man, and it resulted in one of the dogs becoming rabid, which in turn communicated the disease to other dogs and some sheep. Mr. Earl, the well-known London surgeon, in administering medicine to a hydrophobic woman, was bitten by her, and he immediately excised the bitten part. Being accused of unnecessary fear and cowardice, he determined to justify his fears, and having inoculated several rabbits with the woman's saliva, some of them became rabid. Mr. King of Bath succeeded in producing the disease in a common hen by the virus of a cow. Several other cases could be related, but it may serve our purpose to quote the following remarks of Mr. Youatt: 'I can imagine that the disease shall not be readily communicated by the saliva of a graminivorous animal; but I have once produced it in the dog with the saliva of an ox, and twice with that of the horse, but I have failed to do it in very many cases. While on this point, it may be remarked, that the writer once saw a rabid horse bite a young man's hand rather severely, while incautiously giving it a ball of medicine, and he accompanied him to Sir Astley Cooper, who, according to his invariable practice, as he told us, applied nitrous acid to the injured part, and he assured us that no bad effects would accrue; and neither there did.'

We shall briefly notice some of the leading *symptoms* of rabies in the dog and horse. These may be exhibited in a dog in a few days, or it may be, and often is, weeks, and even months after he has been bitten. At first he loses his appetite, becomes sullen, fidgety, has a vacant gaze, licks or gnaws the injured part, laps any liquid that comes in his way—for he has, unlike man, no dislike for water, although he has a difficulty in swallowing it—eats wood, straw, hair, and other indigestible substances; and in a day or two he becomes quarrelsome, bent on mischief, bites at anything that comes in his way, and his bark is more like a howl; his lower jaw often becomes pendulous, and general paralysis sometimes precedes death; and as a rule, on the fifth or sixth day he dies. The principal post-mortem appearances are these—enlargement and increased vascularity of the salivary glands, inflamed condition of the base of the tongue and fauces, epiglottis, and stomach, which last organ almost invariably contains such indigestible substances as straw, hair, offal, &c. The symptoms in the horse, which becomes apparent in a few weeks, are those of extreme irritability. He trembles, heaves, and paws, staggers, and falls; and after a severe struggle he suddenly rises again, and appears settled and collected, when he will again exhibit the usual distressing symptoms. He is sometimes mischievous, bites, foams, and snorts; and generally in three days he dies paralyzed and exhausted.

The disease seems primarily to be one of *blood-poisoning*, and not, as some have represented it, an affection of the nervous system. We know that some instances of blood-poisoning terminate

with coma, or convulsions, but are not, on that account, to be considered as proceeding from nervous disease. Whatever may be the precise nature of the disease, it is certain that no cure has been discovered for it. The writer has seen many dogs, some horses, and an ox in all the different stages of it, and many attempts at a cure tried, without producing even any palliative effects, and every one of the patients died in the ordinary course, whether anything or nothing was done. As the disease is so rare, and—contrary to popular belief—is not more prevalent at one period of the year than another, no anticipatory precautionary measures can be taken. Preventive measures, however, when it is known, or even suspected, that the disease has manifested itself, should not for an instant be neglected. All dogs known to have been bitten, or been in the company of the rabid animal, should be immediately destroyed, and every other dog in the town and district confined, or closely muzzled, for several weeks, or even months. As to the measures to be taken when a human being is bitten by a rabid animal, see HYDROPHOBIA.

RA'BINET, a small piece of ordnance formerly in use. It weighed but 300 pounds, and fired a small ball of 1½ inch diameter, with a very limited range.

RA'CAHOUT, a farinaceous food imported from the Barbary coast, and sometimes recommended, but with questionable judiciousness, to invalids. It is believed to consist of the meal of the acorns of the Barbary Oak (*Quercus Ballota*), flavored with some aromatic herb. It is sometimes sold under its French designation of *Racahout des Arabes*. It must not be confounded with Tacahout (q. v.).

RACALMUTO, or RAGALMUTO, a town of Sicily, in the province of Girgenti, in an inland situation, on the crest of a hill 12 miles north-east from Girgenti. It is said to be of Saracenic origin. It has a castle, built by Frederick Chiaramonte in the 14th century. Pop. (1871) 11,012.

RACCONI'GI, a town in the west of Northern Italy, pleasantly situated on the Maira, 24 miles south of Turin by railway. Its palace, surrounded by a small but handsomely laid-out park, is one of the country residences of the royal family. Silk fabrics and twist, and woollen cloths, are manufactured. Pop. 8211.

RACCOON'N, or RACCOON (*Procyon*), a genus of quadrupeds of the Bear family, *Ursida*, but differing widely from the typical members of that family, in being less perfectly plantigrade, the whole sole of the foot being indeed rested on the ground when the animal is still, but being partly raised when it walks, whilst when running it only touches the ground with the tips of its toes, and moves in a bounding manner. The dentition also differs from that of bears, there being, for one thing, only six instead of seven molars on each side in the lower jaw. The dentition indicates an aptitude both for animal and vegetable food. The general appearance may be described as intermediate between that of a fox and of a bear in miniature. The raccoons are exclusively American. The Common R. (*P. lotor*) is a native of North America, from Canada to the south of Mexico. It is about the size of a small fox, grayish-brown; the muzzle white. The hair, is of two kinds, an under-coat soft and woolly, of a uniform gray; and long and rather stiff hairs projecting through the wool, and alternately marked with black and grayish-white.

The R. frequents the seashore, and the margin of swamps and rivers. It commits great ravages on fields and Indian corn, plantations of sugar-cane, &c., and is not less destructive to poultry. It feeds much on oysters, particularly in the alluvial coast-lands of Carolina and neighboring regions where the American oyster abounds on the banks of rivers and creeks, and exhibits great dexterity in opening oysters. It is also very fond of crabs and

Raccoon (*Procyon lotor*).

other crustaceans. It has a curious habit of dipping or washing its food in water, whence its specific name *lotor* (Lat. washer). When pursued, it often takes refuge in a tree, climbing with great agility, but its destruction is then considered sure, whence the American proverbial reference to a *tree'd 'coon*. The fur of the R. is used in the manufacture of hats, and is a considerable article of commerce.—Another species, the CRAB-EATING R. (*P. cancrivorus*), the Crab-dog of Guiana, is found in all parts of South

America east of the Andes. It is rather larger than the common R., although very similar to it.—Both species of R. display the same love of glittering things which is so remarkable in magpies, jackdaws, and others of the crow family. Mr. Wood mentions in his *Natural History* that a common R. did its best to get a ring off his finger by hitching one of its crooked claws into the ring, and pulling with all its strength; and a gentleman once resident in Guiana informed the writer of this article that a crab-eating R., which he caught young, and completely tamed, showed such a propensity to steal silver spoons, that he was obliged to send it away into the woods.

RACE. 'A race is a class of individuals concerning which there are doubts as to whether they constitute a separate species, or a variety of a recognized one. Hence the term is *subjective*; i. e., it applies to the *opinion of the investigator* rather than to the *object of the investigation*; so that its power is that of the symbol of the unknown quantity in algebra. The present writer having as yet found no tribe or family for which a sufficient reason for raising it to a new species has been adduced, has either not used the word *race* at all, or used it inadvertently. Its proper place is in *investigation*, not in *exposition*.'—Latham, *Natural History of the Varieties of Man*.

RACE, the portion of a loom from which the shuttle is projected through the shed, or separated threads of the warp.

RACE, a term employed in some cases, particularly in the English Channel, to designate the powerful current formed by a rushing tide. Thus, between the island of Alderney and Cape La Hogue, on the coast of France, is the *Race of Alderney*; and off the Isle of Portland, on the coast of Dorsetshire, England, is the *Race of Portland*.

RACEHORSE, a breed of horses distinguished for extreme fleetness. It owes its origin in great measure to Arabian, Barbary, and Turkish horses introduced into England. The great interest taken in Horse-racing (q. v.) since the time of James I., has led to the greatest care of the animals employed in it, and the

Racehorse.

utmost improvement of the breed. The racehorse is generally longer-bodied than the hunter, and the same power of leaping is not required. See HORSE-RACING.

RACE'ME (Lat. *racemus*, a bunch of grapes), in Botany, a form of Inflorescence (q. v.) which is *centripetal* (see CENTRIFUGAL AND CENTRIPETAL), and in which the flower-stalk throws off branchlets (*pedicels*) of nearly equal length, and each bearing a single flower. Familiar and very perfect examples of the R. may be seen in the Red or White Currant and in the Barberry. Notwithstanding the origin of the name, a bunch of grapes is not a true R., but a Panicle (q. v.).

RACE'MIC ACID. See TARTARIC ACID.

RACHEL, ELISA (properly ELISA RACHEL FELIX), a celebrated French *tragedienne*, was born at Munf, in Switzerland, of poor Jewish parents, on the 28th February 1820. The family removed to Lyon, in France; and in order to aid in its support, the child R. and her sister Sarah were in the habit of singing for chance gratuities in the streets and cafés of the place. In 1831, the household was transferred to Paris, and for R., lessons were procured in singing from an eminent teacher of the day. In music, she gave no promise of special excellence; and in 1833 she made her first appearance on the stage as an actress. Though her talent had previously been discerned by certain of the more judicious (among others, Jules Janin and the celebrated Mademoiselle Mars), it was only in 1838 that in the character of Camille, in Corneille's tragedy of *Les Horaces*, she first strongly attracted the attention of the public. The admiration excited by her performance rapidly grew into enthusiasm; and from this time forward, in the great parts supplied by the classic masterpieces of Corneille, Racine, and Voltaire, she shone without a rival. In 1843, her fame may be said to have culminated in her appearance

as *Phédre* in the tragedy of that name by Racine. In *Adrienne Lecouvreur*, a piece expressly written for her by MM. Legouvé and Scribe, she had also immense success, though in other more modern parts, her popularity was somewhat less. The *furor* excited in Paris in 1848 by her public recitation of the *Marseillaise Hymn*, in the interest of the revolutionary government, will continue to connect her name with the public history of the period. In 1849, she made the tour of the French provinces, and subsequently visited England and Russia, everywhere meeting with success and enthusiastic recognition. Her health, however, had begun to fail: in 1855, in the course of a professional visit to America, it altogether gave way, and she returned utterly prostrated. A residence at Cairo failed to restore her to strength; and on the 31 January 1858, she died at Cannet, near Toulon.

As an artist, within the limits prescribed by her genius, she has probably never been quite equalled. Of the burning intensity which characterized her rendering of passion in its fiercer concentrations; no words can give an adequate image. 'She does not act—she suffers,' some one very well said of her. Her *Phédre*—by common consent her masterpiece—was an apocalypse of human agony, not to be forgotten by any one who ever witnessed it. In character, R. was neither exemplary nor amiable. Of the details of her private life it is as well nothing should be said. In her professional relations, she was notoriously grasping and avaricious. Her immense popularity enabled her, during much of her career, pretty much to dictate her own terms to her managers, and of this power, she has said to have availed herself without scruple or generosity. In this way she very rapidly amassed a large fortune. If little else of good is on record of her, she was constant in her home affections, and throughout she frankly made her whole family sharers of her prosperity.

RA'CHIS (Gr. the back-bone), in Botany, the *primary floral axis*, an elongation of the stem or of a branch, from which arise the flower-stalks (peduncles), or to which the flowers are immediately affixed.

RACINE, JEAN, the most admired of all the French dramatists, was born at Ferté-Milon, 21st December 1639, of a respectable family belonging to the *bourgeoisie*. At the age of four he lost both his parents, and then went to live with his maternal grandfather, by whom he was sent to the college of Beauvais. Here he remained till he was 16, at which time his grandfather died. He was then taken to Port-Royal (q. v.), where his grandmother and his aunt Agnes were leading a reclusive life, and placed at the school which had been opened in that celebrated retreat by the pious scholars assembled there.

R. astonished his teachers by the rapidity of his progress in all his studies, especially in Greek; but he won their regards still more by the affectionate seriousness of his character, which gave a delicacy to his ardent sensibilities and vivid imagination. They loved him, yet they trembled for him. When they saw him wander—Sophocles or Euripides in his hand—among the shadows of the abbey, anxiety took possession of their hearts; and when they learned that he secretly indulged in the sinful pastime of making verses, they even thought it necessary to punish their favorite. Their punishment was indeed an odd one, for they obliged him to turn the hymns of the Roman breviary into French verse! Novels were placed under the same ban as poetry. One day the sacristan Lancelot found him reading the Byzantine romance of Bishop Heliodorus (q. v.), entitled *The Loves of Theagenes and Charicleia*, and threw the book in the fire; but R. says that it was already fixed in his memory, and that he smiled at this futile attempt to rob him of it. We can easily see that R. was not at all ascetically disposed as yet. After a residence of three years at Port-Royal, during which time he had, among other things, read and annotated the best Greek and Latin classics, he went to the Collège d'Harcourt to finish his curriculum with the study of logic. Then he went out to 'see life,' got into loose company, became irregular himself, and even grew so reckless as to burlesque, in his correspondence, the pious phraseology in vogue at Port-Royal. Deep was the grief and incessant were the remonstrances of his old friends, but they were long without avail. He had made some little name as a poet by an Ode on the marriage of the king, and had had the good fortune to get a pension for it, but still his income was small and precarious; and when a maternal uncle, who was a canon-regular of the church of St. Genevieve at Uzès, in Languedoc, held out to him the hope of a benefice, R. went to live with him in 1661, and tried to study systematic theology. But the effort was a hopeless one.

While he gazed vacantly into the *Summa* of St. Thomas, his thoughts were with Ariosto and Sophocles. In the summer of 1662, he returned to Paris in disgust, and commenced life as a dramatic writer, having meanwhile made the acquaintance of Molière and Boileau. His first piece was the *Épaves ennemies*, played in 1664; but it was not till 1667, when his *Andromaque* appeared, that the power and peculiar character of his genius excited marked attention. For the next ten years, his career as a

dramatist was unsurpassably brilliant, yet, strange to say, we know almost nothing of his private or social life during that time. We have to content ourselves with little more than a few meagre facts relative to his literary performances, the chief of which are *Britannicus*, *Berénice*, *Bajazet*, *Mithridate*, *Iphigénie*, and *Phédre*. Suddenly, at the early age of 38, in the full sunshine of his fame and vigor of his power, he resolved to abandon both the stage and the world, and become a Carthusian monk. The effect of his Port-Royal training was now seen. In the midst of all his literary ambitions and strifes, his little excesses, irregularities, and amours, R. had carried with him a keen and faithful conscience; and partly from disappointment, partly from remorse, he longed to forget all in acts of devotion. With difficulty, he was prevailed upon to modify the rigor of his purpose, and instead of seeking for religious felicity through the privations of solitude, and the severities of penance, to do so through marriage with some pious woman, and the cultivation of domestic virtues. A suitable lady—very devout, but not very intelligent—was found for the poet in the daughter of the city-treasurer of Amiens, and the marriage took place in 1677. Seven children, two sons and five daughters, were the fruit of this union. Shortly after it, R. was appointed historiographer to the king. Henceforth, his course of life was pursued with the utmost regularity—one-third of the day being given to God, another to his family and friends, and the remainder to the king.

His *Esther* (1690) and *Athalie* (1691) are the only dramas which he produced after his conversion, and they are profoundly imbued with religious feeling. *Athalie* is reckoned by some his finest effort, and certainly the only one which can at all be placed in comparison with it is the *Phédre*. The poet died, after a brief illness, on the 21st of April 1699.

R.'s dramatic genius was essentially French, or pseudo-classical, and therefore it is not easy for Englishmen trained to appreciate the power, magnificence, and variety of the Shakspearian tragedy, to sympathize with it or to criticize it impartially. In the eyes of his countrymen, he is the most perfect, if not the most sublime, of all their dramatists. Corneille may at times exhibit a grander and more rugged energy, but in beauty, grace, and a certain tender majesty of style, R. is held to be without a rival; and it must be remembered that *style*, and not portraiture of human character, is the thing in which French dramatists aim to shine. The declamations in which the heroes and heroines of R. indulge, are marvelously fine pieces of rhetoric; but, compared with the Elizabethan drama, they are deficient in deep insight into human nature and in genuine passion, while humor is altogether excluded. See *Mémoires* of R., edited by his son Louis. The editions of his works are innumerable, and some are of great splendor; that of Girodet (Paris, 3 vols. 1801—1805) being reckoned one of the finest specimens of typography in the world.

RACINE, a city of Wisconsin, U.S., situated on Lake Michigan, at the mouth of Root River, which forms an excellent harbor, and on the line of the Chicago and Milwaukee Railway, 23 miles south of Milwaukee. It has ship-yards, factories, furnaces, &c. Pop. (1860) 7322; (1870) 9880; (1880) 16,031.

RACK (Sax. *wrocan*, Ger. *recken*, to stretch), an instrument of torture, used for extracting confessions from criminals and suspected persons. It consisted of a large oblong frame of wood, with four beams a little raised from the ground, on which the sufferer was stretched and bound. Cords were attached to his extremities, and gradually strained by means of a lever and pulleys, till the operation, if persisted in, caused dislocation of the limbs. The rack was known in the 1st and 2d centuries in the south of Europe, and applied to the early Christians. It was in use in England in the 15th and 16th centuries. According to Coke, it was first introduced into the Tower by the Duke of Exeter, Constable of the Tower, in 1447, whence it came to be called the 'Duke of Exeter's daughter.' It is mentioned by Holinshed in 1467; but its use first became common in the time of Henry VIII. as an implement of torture for prisoners confined in the Tower. The infliction of the punishment of the rack took place during the reign of the Tudor sovereigns, by warrant of council, or under the sign-manual. In 1623, however, on the murder by Felton of the Duke of Buckingham, it being proposed in the Privy Council, to put the assassin to the rack, in order that he might discover his accomplices, the judges resisted the proceeding, as contrary to the law of England. In various countries of Europe, the rack has been much used both by the civil authorities in cases of traitors and conspirators, and by members of the Inquisition to extort a recantation of heresy. It is no longer in use in any part of Europe.

RACK, or **RACK-WORK**, is a straight bar, with cogs or teeth placed along it, so as to correspond with similar cogs or teeth placed on a wheel, thus: If the bar is not movable, the wheel is attached to a traversing frame, and as it revolves, is moved along

by the resistance of its teeth to those on the bar. It was in this way that the formation of a railway was first projected; the rail and the driving-wheel of the engine to be both furnished with corresponding teeth. In mechanics, rack-work has innumerable applications.

Rack-work.

RA'CKETS (Fr. *raquette*), a game frequently played in England; it is merely a modern variety of the old game of **TENNIS** (q. v.).

RACK RENT is the full yearly value of lands let upon lease, or to an occupier, or held by a tenant for life, as distinguished from the value fixed by the lease or agreement between the parties, and which is often less or greater than the real value.

RACOO'NDA, or **NU'RRIA**, the four of the Coypu (q. v.).

RACZ, or **O BECZE**, a town of Hungary, in the Servian Wojwodschaff, on the right bank of the Theiss, 26 miles N.E. of Peterwardein. It carries on an extensive trade in corn. Pop. (1880) 15,040.

RADACK and **RALICK**, two parallel chains of islands in the group called Marshall's Islands. See **POLYNESIA**.

RADCLIFFE, **DR. JOHN**, a celebrated physician, and the founder of the Radcliffe Library at Oxford, was born at Wakefield in Yorkshire, in the year 1650. He was instructed in Greek and Latin at the grammar-school of his native town; and at the early age of 15, was sent to University College, Oxford. In 1672, he took his degree of M.A., applied himself to the study of medicine, and having taken his degree of M.B. in 1675, began to practise as a licentiate at Oxford. He immediately made himself conspicuous by the originality of some of his ideas, treating the cases in which he was engaged with a total disregard of the usually received rules of the profession, and even holding up these to censure and ridicule. At the very commencement of his practice he made some remarkable cures; and in less than two years, was on the high road to celebrity. In 1682, he took the degree of M.D., and remained still two years longer at Oxford in the practice of a lucrative profession.

In 1684, Dr. R. removed to London. He established himself in Bow Street, Covent Garden, where, in less than a year, he became the most popular physician of his time. It is said that his conversational powers, ready wit, and pleasantry contributed to this result, quite as much as his professional skill. In 1686, the Princess Anne of Denmark made him her physician. After the Revolution, he was sent for by King William, who frequently had recourse to his advice, and the example of the sovereign was followed by most of the nobility and influential persons about the court. Dr. R., however, was himself no courtier; he had no occasion to become one. Dr. Mead, who knew him well, pronounced of him, that he was 'deservedly at the head of his profession, on account of his great medical penetration and experience.' Blunt and independent in his manners—some indeed say even *brutal*, people nevertheless recognized under his rough exterior that quick perception and keen observation of symptoms which are so important in a master of the healing art; and thus his advice was asked by persons of all ranks, in return for which he received fees of an unprecedented amount.

In 1694, he was called upon to attend Queen Mary, when attacked by the small-pox. It proved to be her last illness, as Dr. R. predicted, even before seeing her—merely upon reading the prescriptions of the other physicians in attendance before he was sent for. He did what he could, however, to save her, but in vain; and some attributed her death either to his want of skill or negligence. About this time he offended the Princess Anne, who, having sent for him on some occasion to St. James's, had the mortification to hear that he swore all her Royal Highness's ailments were nothing else than 'the vapors.' This, combined with her knowledge of Dr. R.'s too great fondness for the bottle, made her appoint Dr. Gibbons as her physician in his place. Still, the king continued to employ him. On one occasion, he sent for him to the Netherlands to attend upon his favorite, the Earl of Albemarle, for which he received £1200 from the king, and £400 from the patient himself, besides a diamond ring. To the king himself, he frequently spoke with much honesty and plainness concerning his ailments; once, however, he took too great a liberty, for upon his Majesty showing him his swollen ankles, and asking him what he thought of them, Dr. R. replied: 'Why, truly, I would not have your Majesty's two legs for your three kingdoms.' This was towards the end of 1699. He was not again consulted by that sovereign, who soon afterwards died; nor was he ever again completely reinstated in the good graces of Queen Anne, although she occasionally consulted him, and rewarded him handsomely for his services.

In 1713, he was elected M.P. for Buckingham. He had a country-house at Carshalton, to which he used occasionally to

retire; and here he was living in 1714, when Queen Anne was attacked with what proved to be her last illness. Dr. R. was summoned to attend her; but he either would not or could not come. He had taken physic, he said, and it was impossible for him to attend. The queen died in August; and the populace were so enraged against Dr. R., that he dared not again show his face in London. This much chagrined him, as it kept him a prisoner in a country village. His own end, however, was fast approaching. He must have been really ill when sent for to the queen, as he himself survived her for only two or three months. Dr. R. died of gout at Carshalton on the 1st of November 1714, and was buried at Oxford in St. Mary's Church with much ceremony. He died possessed of considerable property, the whole of which he bequeathed to public uses. Thus, to University College he left his estate in Yorkshire, in trust, for the endowment of two traveling fellowships, and the purchase of perpetual advowsons, together with £5000 for the enlargement of the college buildings. He left £40,000 for the erection of a public library in Oxford, since known as the Radcliffe Library (q. v.), which he endowed with £150 per annum for a librarian, and £100 per annum for the purchase of books. To St. Bartholomew's Hospital, London, he bequeathed the yearly sum of £500 towards mending the diet, and £100 per annum for the purchase of linen. The rest of his property he gave to his executors in trust for such charitable purposes as they might best approve. The Radcliffe Infirmary and Radcliffe Observatory, at Oxford, were both erected out of this fund; and from the same source, in 1823, the Radcliffe Trustees contributed the sum of £2000 towards the erection of the College of Physicians in Pall Mall.

RADCLIFFE, ANN, the most popular English novelist at the close of the last century, was born in London, July 9, 1764. She was of respectable parents named Ward. In her 23d year, she married Mr. William Radcliffe, a student of law, but who became proprietor and editor of a weekly newspaper, the *English Chronicle*. Mrs. R. lived much in retirement, known only to a few friends by whom she was warmly esteemed. Her works are—*The Castles of Athlin and Dunbayne* (1789), *A Sicilian Romance* (1790), *The Romance of the Forest* (1791), *The Mysteries of Udolpho* (1794), *A Journey through Holland*, &c. (1794), and *The Italian* (1797). Mrs. R.'s popularity was constantly increasing down to the date of her latest work, when, in her 33d year, 'like an actress in full possession of her applauded powers,' as Scott has remarked, 'she chose to retreat from the stage in the full blaze of her fame.' She lived 26 years afterwards, dying in 1823. For the copyright of her *Mysteries of Udolpho*, her best work, she received £500; and for that of *The Italian*, £800. These sums were at the time considered excessive, and were perhaps the largest ever given in this country for works of fiction until the great era of the Waverley Novels. A sixth romance, entitled *Gaston de Blondville*, and a collection of *Poems* by Mrs. R., were published after her death.

As a novelist, Mrs. R. is pre-eminent for vivid poetical imagination, and for great power of romantic narrative and description. Her paintings of external nature, and of scenes of feudal pomp, gloom, terror, or mystery, are quite unrivalled in modern romance. In the art of awakening curiosity and enchainning attention, she is no less skilful. She keeps her readers in a state of breathless awe and suspense; but in the end, when she resolves all the seemingly supernatural agencies and horrors of her tales into simple natural causes, she unquestionably fails, for her explanations are inadequate to account for the effects produced. She has also little variety of character or striking individual portraits, and no wit or humor. Hence her works, with all their gorgeous pictures and potent spells, seldom interest beyond the period of youth.

RADCLIFFE LIBRARY, Oxford. This institution, founded by Dr. John Radcliffe (q. v.), stands in the central area of Radcliffe Square. The building is in the form of a rotunda, standing upon arcades, from the center of which rises a spacious and well-proportioned dome. This dome is 84 feet in height from the pavement, and is beautifully wrought in stucco. The architect was James Gibbs, who commenced the building in 1737, and completed it in 1747. The library is approached by a handsome stone staircase, and over the entrance-door hangs the portrait of the founder by Sir G. Kneller. The books composing the library are for the most part works on natural history, physical science, and medicine. Besides these, Gibbs, the architect, bequeathed to it a collection of works, chiefly architectural; Wise, the first librarian, a collection of coins; Kennicott, a theological collection; Frewen; a miscellaneous library; Viner, some law-books; while from the Frazer and Sale collections, the trustees purchased 355 Oriental MSS. in the years 1758 and 1760. In 1856, the number of volumes comprising the scientific and medical collection was estimated by Dr. Acland, the librarian, as not less than 14,000, and not more than 15,000. From the year 1834 to the year 1840, the trustees expended £500 annually on the purchase of books. The grant, however, was reduced to £200 in 1841, and continued at

that low figure until 1863, when it was again raised to the sum of £500. In 1861, by an agreement between the Radcliffe Trustees and the university, the scientific books of the Radcliffe Library were removed to the University Museum, then recently erected, for public use under prescribed regulations, and the spacious room in the Radcliffe Library was opened as a reading-room in connection with the Bodleian Library. This reading-room is now open daily until 10 o'clock at night, to the great comfort and convenience of numerous readers.

RADEGUNDA, Sr., daughter of Berthar, a prince of Thuringia, in the earlier part of the 6th century. Having been carried as a prisoner to France in the twelfth year of her age by Clotaire, at that time king of the district whose capital is now called Soissons, she was educated in the Christian religion, and when she reached a maturer age, was induced, very reluctantly, to become the wife of Clotaire. Her own wish having been to become a nun, her married life was in great measure given up to works of charity and religion, and Clotaire complained that he 'had married a nun rather than a queen.' Eventually, about the year 553, she obtained his leave to retire to a monastery at Noyon, where she was consecrated a deaconess by the bishop Medard. Soon afterwards, she founded a monastery at Poitiers, in which she lived as a simple sister, but which she endowed richly, not only with money and lands, but also with relics and other sacred objects obtained from the Holy Land and all the more eminent churches of the East and West. It was on the occasion of the translation to her church at Poitiers of a relic of the holy cross that the Christian poet Vexantius Fortunatus composed the celebrated and truly magnificent hymn *Vexilla Regis Prodeunt*. R. outlived her husband by more than a quarter of a century, during which she was regarded as a model of Christian virtue; and her life has formed the subject of many beautiful legends, still popular in Germany and France. Her monastery, before her death, which took place in 587, numbered no fewer than 200 nuns. Her feast is held on August 13, the anniversary of her death.

RADETSKY, JOHANN JOSEPH WENZEL, Count of Radetz, and an Austrian field-marshal, was born at Tzrebinitz, in Bohemia, in November 1766; and in 1784, entered the Austrian military service as a cadet in a Hungarian cavalry regiment, making his first campaign against the Turks in 1788—1789. He took part in the Austrian wars with Napoleon, brilliantly distinguished himself, and rose to the rank of lieutenant field-marshal. After the conclusion of peace, he was stationed mostly in Hungary; but the threatening aspect of affairs in Italy caused him to be sent to take the command of the Austrian army in Lombardy; hostilities were, however, deferred, and R. seized this opportunity of putting Verona in a complete state of defence. The Emperor Ferdinand, on his accession in 1836, acknowledged R.'s numerous and valuable services by raising him to the rank of field-marshal. The rebellion at last broke out suddenly in 1848, and R. was forced to retire from Milan and continue his retreat to Verona (April 2). His departure was the signal for a general insurrection, only the renowned Quadrilateral (q. v.) and the citadel of Ferrara remaining in the hands of the Austrians; and the revolt of Venice cut off all R.'s communications except that to the Tyrol. The Piedmontese army had now effected the passage of the Mincio (May 7), and closely invested Peschiera, thus rendering R.'s position extremely critical one. He had only 50,000 men to oppose to the Piedmontese army of 41,000 men around Peschiera, a corps of observation 6000 strong near Mantua, a body of 4000 guarding the passage of the Mincio, the Roman army of 14,000 men holding the south bank of the Po, and an army of Venetian insurgents, numbering 15,000, in his rear. Being thus unable to take the offensive, he waited anxiously for the reinforcements which he expected by the Illyrian frontier, and which, after defeating the Venetian and Roman armies which attempted to stop their progress, joined him at Verona on May 22.

The Austrians now assumed the offensive, and marched on Mantua, defeating the Italians in two bloody conflicts at Montanara and Curtatone, but were in turn signally vanquished at Goito by Charles Albert, who gained by this victory the immediate surrender of Peschiera (May 29), and rendered R.'s position more critical than ever. But the gallant Sardinian was no match for R. in generalship, for he wasted his time before Mantua, till R. had raised an army of 82,000 men, with which he drove the king (July 22 and 23) back, defeated him at Custozza (July 25), pursued him closely, converted his retreat into a disorderly flight, and again defeated him under the walls of Milan (August 4). The king was now besieged in Milan, but (August 6) a six months' armistice was agreed to, and war was not resumed by the Piedmontese till March 1849. R. was this time better prepared, and at once invaded Piedmont; after a successful brush with the enemy at Vigevano (March 21), he totally routed them at Novara (March 23), after an obstinate conflict of six hours' duration. Peace was now concluded with Piedmont, and R. next besieged Venice, which surrendered after a long siege (August 23). He

was then appointed governor-general of Lombardy and Venice, and ruled with absolute authority till his retirement on February 28, 1857, suppressing all insurrections and disturbances with the utmost rigor. He died at Milan, January 5, 1858, at the age of 91 years. He bore the character of a brave soldier and consummate tactician, and, strange to say, acquired all his European reputation after he had passed his 80th year.

RADIA'TA, the lowest of Cuvier's four great divisions of the animal kingdom, derive their name from the organs of sense and motion being disposed as rays round a center; the other three, in ascending order, being the *Articulata*, the *Mollusca*, and the *Vertebrata*. Before Cuvier's time, all invertebrate animals were divided into *Worms* and *Insects*. In 1795, he presented a Memoir to the Natural History Society of Paris, in which, to use his own words, he 'marked the characters and limits of the molluscs, crustaceans, insects, worms, echinoderms, and zoophytes;' and in a Memoir read before the Institute in July 1812, he 'distributed these various classes under three grand divisions, each of which is comparable to that of the vertebrate animals.' The necessity for the dismemberment and re-arrangement of this heterogeneous assemblage which Cuvier grouped together in his **RADIATA**, has long been felt; and at the present day, 'the radiate mob' (as Professor Huxley terms it) may be regarded as effectually demolished. To show how these animals have been re-arranged, it is necessary first to mention that Cuvier himself divided them into five classes—namely, (1) the *Echinodermata*, (2) the *Entozoa* (or Intestinal Worms), (3) the *Acalephæ* (or Sea-nettles), (4) the *Polypi*, and (5) the *Infusoria*. The *Echinodermata* were included by Huxley (*Elements of Comparative Anatomy*, 1864) in the *Annuloida*; while J. Victor Carus (*Handbuch der Zoologie*, 1863) made them an independent group. (For a newer and complete classification, see the article **ZOOLOGY**.) The *Entozoa* are placed by Huxley under the *Annuloida*, and by Carus under the *Vermes*. The *Acalephæ* are by unanimous consent placed in the *Cœlenterata*, a primary group established by Frey and Leuckart. Of the *Polypi*, those with ciliated arms (the *Bryozoa* or *Polyzoa*, of which the Sea-mat or *Flustra* is a well-known example) are now placed among the lower molluscs, which, under the term *Molluscioida*, are considered by Huxley as one of the eight primary groups; while the remainder are placed amongst the *Cœlenterata*. For the *Infusoria*, see that head; see also **PROTOZOA**, **SUB-KINGDOMS** (**ANIMAL**).

RADIA'TION OF HEAT. See **HEAT**.

RADICAL (Lat. *radicalis*, fundamental, from *radix*, root), originally *radical reformer*, a name used for one of the party which advocates extreme changes of a democratic character in the state.

RADIOLARIA, a class of the Protozoa (q. v.), along with *Rhizopoda*, *Foraminifera*, *Infusoria*. See also **ZOOLOGY**.

RADIOLITÆS, a genus of lamellibranchiate mollusca, found only in Cretaceous rocks, and remarkable for the great diversity of its valves. The upper valve is flat or conical, with a central umbo; and the lower is an elongated cone, and has on its inner surface two large dental sockets, and lateral muscular impressions. The upper valve is not perforated with canals, as in the nearly related genus *Hippurites*. More than forty species have been described.

RADISH (*Raphanus*), a genus of plants, of the natural order *Crucifera*, having a spongy Silique (q. v.), which does not split open when ripe, ends in a conical or awl-shaped beak, and is more or less divided into transverse cells, in some species adhering together even in decay, and in some falling asunder. The flowers are yellow, red, or purple.—The **COMMON R.** (*R. sativus*) has thick, round, tapering, and pointed pods, little longer than their stalks, very slightly contracted, and not falling to pieces. It is an annual, with branching stem from two to four feet high, rough, lyre-shaped leaves, and pale violet-colored flowers with dark veins. It is a native of Asia, from the coasts of the Mediterranean to Japan, and has been cultivated in China, India, and Europe from the most ancient times, for the sake of its fleshy roots, which have a sharp biting taste, and are much used when young as a salad, and also to some extent as a boiled vegetable. In this latter way, the young and tender leaves were also formerly used.

The varieties of *R.* in cultivation are extremely numerous; but they are generally classed under the two heads of *Long-rooted* and *Turnip-rooted* Radishes, the roots of the former resembling the carrot in shape, and the latter the turnip. The varieties differ very much, not only in form of root, but in color and size, a red color generally prevailing. Some of the darker-colored turnip-rooted radishes attain the size of a man's head. Radishes are sown at different seasons, and are generally used when young and small; but some kinds are occasionally stored for winter. The root of the *R.* possesses demulcent, stimulant, and diuretic properties, and is sometimes used in cases of atony, or of excessive

secretion of mucus by the organs of digestion or the urinary organs. *R.* juice mixed with sugar-candy, is a popular and useful German remedy for hoarseness and cough.—Distinct from both the varieties above-named is the *OIL R.*, which has a slender—scarcely fleshy—root, a short much-branched stem, and many-seeded pods. It is cultivated in China for the oil of its seeds.—Another species of *R.* (*R. caudatus*), a native of Japan, is there cultivated as an esculent.—To this genus belongs the **JOINTED CHARLOCK** of our corn fields (*R. raphanistrum*), which has found its way from Europe to North America, and is a troublesome weed there also. The seeds, however, may be advantageously crushed for oil.—The *SEA R.* (*R. maritimus*) is a more rare British species, the roots of which are of fine quality and great pungency.

RA'DIUS, in Geometry, is a straight line drawn from the center to the circumference of a circle. See **CIRCLE** and **QUADRATURE**. In Trigonometry, the radius is taken as unity, and the sines, cosines, &c., are expressed in terms of it. In Astronomy, the same term is employed in a slightly different sense; and to prevent confusion, it is changed into *radius-vector*. The *radius-vector* is a straight line drawn from the center of force to the position of a body which describes its orbit round that center; if the orbit is a circle, the *radius-vector* is invariable in its length, but constantly changes if the orbit be any of the other conic sections. From astronomy the term has been transferred to what are called *polar equations* in the higher mathematics. To express a curve by this method a point is taken for the *pole*; through this point a line, the *axis*, is drawn, indefinite in length and arbitrary in direction; then as one end of the *radius-vector* is at the pole, its inclination to the axis, and its length at this inclination, will give a point in the curve. Equations to curves, when thus expressed in terms of the *radius-vector*, and its inclination to the axis, are called *polar co-ordinates*, and are generally much simpler in form than when expressed by rectangular *Co-ordinates* (q. v.).

RA'DNOR, **NEW**, a municipal and parliamentary borough in Radnorshire, of which it was formerly the capital, stands in the midst of exceedingly wild and hilly scenery on the south border of Radnor Forest, and 8 miles west-south-west of Presteigne. In the immediate vicinity is the cascade of *Water-break-its-neck*, which descends from a height of 70 feet, and is one of the most celebrated in Wales. *N. R.*, once comparatively important, has dwindled into a small county town, remarkable only for the beauty of the surrounding scenery. In 1864, a statue in memory of Sir George Cornwall Lewis was erected at New Radnor. Pop. (of parliamentary borough) in 1871, 2190. The business of the county is transacted at Presteigne, the county town, which contains (1871) 1910 inhabitants.

RADNORSHIRE, an inland county of South Wales, bounded on the N. by Montgomeryshire and Shropshire, and on the S. and S.E. by Brecknock and Hereford. Area, 276,552 acres; pop. (1871) 25,430; (1881) 23,539. Groups of mountains, seldom forming themselves into continuous chains, cover the greater part of the surface of the county. Radnor Forest, which attains the height of 2163 feet, runs east and west, and is the loftiest and most connected of the ranges. The south-eastern district is flat, with a gradual slope towards the east. Of the rivers, the chief of which flow southward, the principal is the Wye (which forms the greater part of the southern boundary of the county), and its tributaries the Ithon, the Elan, and the Lugg. The county formerly comprised large tracts of bog and moorland, which are in course of being gradually reclaimed and cultivated. Its valleys, especially that watered by the Lugg, are famed for the richness of their pastures, which feed splendid herds of 'Herefords.' In the east and south-east districts of *R.* excellent wheat, barley, oats, and potatoes are grown. Though rather more than half the county is cultivated, yet of this less than a third is under the plough, fully two thirds being in permanent pasture, chiefly for rearing sheep. The county returns one member to the House of Commons.

RA'DOM, a government in the kingdom of Poland (q. v.), is situated to the south of the government of Warsaw. Area, 4755 square miles; pop. (1880) 613,086. The surface, partly traversed by the Sandowir Mountains, which rise in the Katherinenberge to the height of upwards of 2000 feet, is the most elevated of the kingdom. The principal rivers are the Pilica and the Vistula, both of which flow north. The soil is diversified.

RADOM, capital of the government of the same name, stands on the Radomka, 60 miles south of Warsaw. It has considerably improved in size within late years, and is the seat of an active trade and commerce. Pop. (1880) 12,061.

RADOWITZ, **JOSEPH VON**, Prussian general and statesman, born February 6, 1797, at Blankenburg, was the son of a nobleman of Hungarian descent, received his professional education at Paris, and in the Military School of the kingdom of Westphalia, which he left in 1813, in order to enter the Westphalian army as an officer. After the peace in 1815, he received an appointment as

Master of Mathematical and Military Sciences in the Military School of Cassel; but in 1823, he entered the Prussian service, and in 1830, became chief of the general staff of artillery. By his marriage with the Countess Maria v. Voss (1828), he became connected with the Prussian aristocracy, and soon became the leader of the anti-revolutionary party. In 1836, R. was sent as Prussian military commissioner plenipotentiary to the German Diet at Frankfurt. In 1842, he was named ambassador extraordinary and minister plenipotentiary at the courts of Karlsruhe, Darmstadt, and Nassau; and in 1845, he was raised to the rank of Major-general. Meanwhile his influence on public affairs in Germany became more and more conspicuous; above all, he was the confidant and adviser of King Frederick-William IV. in his endeavors to bring about a reform of the German Diet, as his pamphlet, *Germany and Frederick-William IV.* (*Deutschland und Friedrich Wilhelm IV.*, Hamb. 1848), proves. His Conversations about State and Church, suggested by the present state of affairs (*Gespräche aus der Gegenwart über Staat und Kirche*, Stuttg. 1846) may be taken as a manifestation of the intentions which tried to find a practical issue in the constitution of February 3, 1847.

When the revolution of 1848 broke out, a new field opened itself for Radowitz. The endeavors of Prussia to give a constitution to Germany, by means of the alliance of the three kings, was principally his work. He now obtained the leadership of the affairs of the union in the Prussian chambers as well as in the parliament, which assembled (March 1850) at Erfurt, but was unable to prevent the failure of the union scheme. On September 27, 1850, he became formally Secretary for Foreign Affairs, but in 1851 retired to Erfurt, where he wrote his *Neue Gespräche aus der Gegenwart* (3 vols., Erf. and Leip. 1851). He died December 25, 1853.—Consult Frensdorff, *Joseph v. R. A.* (Leip. 1850.)

RAEBURN, SIR HENRY, R. A., a distinguished portrait-painter, was born on March 4, 1756, at Stockbridge, then a village near Edinburgh, where his father was a manufacturer. His parents died when he was little more than six years old, and he was educated in that well-known institution, George Heriot's Hospital. He was apprenticed to a goldsmith and jeweler when about fifteen years of age; but having a very decided taste for art, he practised miniature-painting during his leisure hours with such success, that he was soon able to buy up his indenture, and devote himself first to miniature, and not long after to portrait-painting in oil. He married when he was twenty-two, and acquired some fortune by his wife. Proceeding to London, with introductions to Sir Joshua Reynolds, he was kindly received by him, and practised in his studio for about two months. Sir Joshua very soon perceived the high talent evinced by the young artist; advised him to visit Rome, and offered him funds for the purpose. Acting on this advice—he had funds sufficient—R. set out, furnished with letters from Reynolds to Pompeo, Battone, and other artists of note in Rome at the time. After remaining two years in Italy, he returned and settled in Edinburgh in 1787, where he soon received full employment as a portrait-painter.

In 1812, R. was elected President of the Society of Artists in Edinburgh; in 1814, Associate of the Royal Academy of London, and in the following year, Academician. He was knighted in 1822, when George IV. visited Scotland, and shortly after was appointed King's Limner for Scotland. He died at Edinburgh on 8th July 1823. R.'s style was modelled in a great degree on that of Reynolds—he aimed, like him, in his pictures to produce breadth—which is the effect obtained by massing together and keeping as far as possible the lights distinct from the shadows, and making them respectively effective, in place of dividing and mixing them up all over the picture; but he carried out this principle in a manner and with a feeling peculiarly his own. He never attempted, by thick impasto and semi-transparent painting, to produce texture and luminous effect, but adopted the opposite mode of painting in a low tone with a sharp touch, working his colors with little admixture of any unctuous medium. In his portraits of men, in particular, he gives the characteristic expression in a simple but decided and effective manner. His style has been thought by connoisseurs to resemble in many respects that of Velasquez. R.'s reputation was very high in his lifetime, and it is still rising, his pictures being now much sought after. Among the notable personages who sat to R. for their portraits were Sir David Baird, Sir Walter Scott, Henry Mackenzie, Neil Gow, Harry Erskine, Dugald Stewart, Professor Playfair, Francis Jeffrey, Henry Cockburn, and many Scottish nobles. An exhibition of his works was held at Edinburgh in 1876.

RAFFLES, SIR THOMAS STAMFORD, a distinguished traveler and naturalist, was the son of a captain in the West India trade, and was born at sea, off Port Morant in Jamaica, on the 5th of July 1781. His first appointment was to a clerkship in the East India House. Having attracted the notice of his superiors by his talents and industry, he received a permanent appointment in the office. In 1805, the Court of Directors determined on sending out an establishment to Penang or Prince of Wales' Island,

and young R. was appointed assistant-secretary. He arrived at Penang in September of the same year; and having studied the Malay language with great diligence during the voyage, he was enabled to enter upon his duties with efficiency on his arrival. He continued his study of the Malay and other eastern languages, in which he made considerable progress. Eventually, R. was made principal secretary. In 1808, he made a voyage to Malacca, where he had the opportunity of mixing with Javanese, Amboy-nians, Borneans, Papuans, Cochinchinese, and Chinese Proper. With respect to Malacca itself, he collected much interesting information. In 1811, when it was resolved by the English government to take possession of Java, then belonging to the Dutch, it was arranged that Mr. R. should accompany the expedition as secretary to the governor-general, Lord Minto, who was himself to take the chief command. After some hard fighting, the troops took possession of the island. Mr. R. received the appointment of lieutenant-governor of Java and its dependencies; and upon the departure of Lord Minto, took upon himself the entire administration of the newly-acquired territory. Much had still to be done in the way of conciliating the native princes and chiefs to the British rule. He had to appoint British residents at several of the native courts, and to frame rules and regulations for their conduct. He ordered a general survey to be made of the whole island, the reading of which, as well as of all the reports connected with that and other things, occupied a considerable part of his time.

By frequent personal interviews with the natives also, he sought to become acquainted with their manners and character, and to make such regulations as would be for their best interests both morally and materially. While engaged in this career of usefulness, his health gave way; and in 1816 he returned to England, stopping by the way at St. Helena, where he had an interview with Napoleon. On his arrival in England, he wrote his well-known *History of Java*, published in two volumes 4to in 1817, in which year he received the honor of knighthood. Java having by this time been restored to the Dutch, Sir Stamford R. was appointed lieutenant-governor of Bencoolen, a settlement upon the coast of Sumatra, where he landed in March 1818. In the latter part of that year he was called to Calcutta, on a visit of business, and instead of returning directly to Bencoolen, was sent to form a new settlement at Singapore. Here he remained for some months, and then again returned to Bencoolen, where he continued to discharge the duties of lieutenant-governor until February 1824, when he was compelled by ill-health to return to England. The vessel in which he set sail took fire, the crew and passengers escaping with difficulty in the boats. By this accident, Sir Stamford R. lost the greatest part of his effects, including a fine collection of natural history, and other things, valued at about £20,000. After his arrival in England, he lived to carry out what had been one of his favorite projects—namely, the formation of the Zoological Society of London, of which he was named President, and to the interests of which he devoted himself to the time of his death. This took place on the 5th of July 1826.

RAFFLESIA, a remarkable genus of plants belonging to the small natural order *Rafflesiaceae*, an order composed entirely of

Rafflesia Arnoldi.

parasitic plants, which consist merely of a flower, and form part of the *Rhizophora* (q. v.) of Lindley. The *Rafflesiaceae* are natives partly of the Indian islands and partly of South America. The plants of the genus *Rafflesia* have neither stalk nor leaves, but are mere flowers seated upon the roots of species of *Cissus*, making their appearance at first as a hemispherical swelling of the bark of the root, and, after the bark has broken, rising up in the form of a head of cabbage, while the perianth is covered with imbricated bractæ, which are more or less recurved after it has opened. The perianth is thick, fleshy, and 5-partite. The germen is inferior, and contains many ovules; and the anthers, which are numerous, are seated under the revolute margin of the

top of the style column. After the flower has expanded, it diffuses a carrion-like smell, that even attracts flies, and induces them to deposit their eggs. The largest and first-discovered species, *R. Arnoldii*, was discovered in 1818 in Sumatra by Dr. Arnold, and was sent to the eminent botanist, Robert Brown, by Sir Thomas Stamford Raffles, the British governor in Sumatra. Its flower measures fully three feet in diameter, is capable of containing almost two gallons of fluid, sometimes weighs ten pounds, and is the largest of all known flowers. A smaller species, *R. patma*, whose flowers are 16 inches—two feet in diameter, is highly prized by the Javanese as a medicine, for its strong styptic powers. *R. Horsfieldii*, another Javanese species, is still smaller, its flowers being only three inches broad.

RAFNS, KARL CHRISTIAN, a celebrated Danish critic and archæologist, was born at Brahesborg, in the island of Fünen, January 16, 1796, and educated at the university of Copenhagen, of which he was appointed sub-librarian in 1821. Even while a boy at the gymnasium of Odense, he was distinguished by his fondness for the old Norse literature and language, and when he became officially connected with the university, he undertook a general revision of all the Icelandic and Old Norse MSS. preserved there. It is to R.'s unwearied exertions that Denmark owes the foundation (1825) of the 'Society for Northern Antiquities,' whose principal object is the publication of criticism of all documents that can throw light on the subject of Old Norse literature. To this single end, R. devoted his whole life. As secretary of this society, he edited and published a great many ancient Scandinavian MSS., occupying about seventy volumes. Among his numerous important works, we may mention a Danish translation of Norse Mythic and Romantic Sagas (3 vols. 2d ed. 1829—1830); an edition (from a manuscript), with philologico-critical remarks, of Ragnar Lodbrogs's death song, under the title of *Kvæðumál, seu Epicedium Ragnaris Lodbroci, Regis Danie* (Copenh. 1826); a complete collection of the Norse sagas (many of these MSS. being hitherto unedited) entitled *Fornalder-Sögur Nordlanda* (Copenh. 3 vols., 1829—1830); and the *Páreyinga-Saga* (1832) in Icelandic, with translations in Danish and Faroese, and a critical apparatus.

But his most widely-known and perhaps his most interesting work, is his *Antiquitates Americanae, seu Scriptores Septentrionales Rerum Ante-Columbianarum in America* (Copenh. 1837), in which, from a critical examination of numerous geographical, nautical, and astronomical data in certain Old Norse MSS., he comes to the conclusion that America was discovered by Norsemen in the 10th c., 400 years before Columbus was born; and that, from the 11th to the 14th century, a large tract of the North American coast had been visited and even partially colonized as far south as Rhode Island and Massachusetts—a conclusion, it may be added, the probability of which has been confirmed in several important points by recent topographico-antiquarian researches in these states. The subject was followed up by him and Finn Magnussen in their *Historical Monuments of Greenland* (3 vols. Copenh. 1838—1845). Another very important work to which R. furnished a great part of the text, carefully worked up from MSS., and a Danish translation of the first three and the 11th books in parallel columns, is the great collection of historical sagas representing events that took place out of Iceland, and entitled *Forumanna Sögur* (12 vols., Copenh. 1828, et seq.). He has also had a great share in drawing up and editing the Icelandic MSS. relating to the history of Russia and other eastern countries, and of which two vols. appeared at Copenhagen in 1850—1852, under the title of *Antiquités Russes*. R. died at Copenhagen, 20th Oct. 1864.

RA'FTERS, the sloping timbers of a Roof (q. v.), which meet in an angle at the ridge, and on which rest the laths or boarding which carry the tiles or slates.

RAGGED SCHOOLS. The ragged school, as distinct from the Certified Industrial School, is a voluntary agency providing education for destitute children, and so preventing them from falling into vagrancy and crime. Vagrant children, and those guilty of slight offences, are provided for in the Certified Industrial School; but the two institutions are frequently combined. See article INDUSTRIAL SCHOOLS. The movement which established ragged schools was almost simultaneous with that which instituted reformatories. John Pounds, a poor shoemaker at Portsmouth, has the honor of originating the idea. For twenty years, up to the time of his death in 1839, he gathered the ragged children of the district round him as he sat at work. They came freely, and were taught gratuitously. The success attending his humble efforts soon led many more influential friends of the 'outcasts' to engage in the same work. In 1838, London had a Ragged Sunday School, which eventually became a free day-school. Field Lane followed in 1843. But the first ragged feeding-school was opened in 1841 by Sheriff Watson, in Aberdeen. In 1845, Dr. Robertson not then aware of the existence of Sheriff Watson's, opened a similar school in the Vennel, Edinburgh. Soon afterwards Dr. Guthrie's famous *Plea for Ragged Schools* appeared, a

work which gave an irresistible impetus to the movement, and caused the author to be generally regarded as the father of ragged schools.

After this, ragged schools spread over all the land, until there was scarcely a town of any importance that had not one or more. The recent Education Acts, however—that for England, 1870, and that for Scotland, 1872—introduced the principle of compulsory attendance at school; under this provision, a large number—especially in England—of such as were merely free day-schools, have become public schools. But as the Education Acts make no provision for feeding the children, the managers of feeding-schools find themselves compelled to continue their efforts. In places where the system has been efficiently conducted, juvenile crime has sensibly diminished. The governor of the Edinburgh prison has stated frequently in his reports, that since the establishment of ragged schools, the number of young persons committed to prison has gradually decreased. It may be mentioned that in one large ragged feeding-school, where in the course of 10 years 4000 children have been enrolled, only 7 deaths have occurred during the period of school attendance. The ragged schools do not receive government aid. The capitation grant of £2, 10s., allowed by a Privy Council minute in 1856, was withdrawn in 1859.

RAGGEE (*Eleusine corocana*), an Indian grain (see ELEUSINE), very prolific, but perhaps the least nutritious of the cereals, although it is the chief food of the poorer classes in Mysore and on the Neilgherries. It is made into dark-brown cakes and porridge, which are described as very poor fare.

RAGHU is, in the legendary history of ancient India, the name of a celebrated king of Ayodhya. See OUDE. He belonged to the royal dynasty which derived its origin from the sun; and amongst his descendants is Rāma (q. v.). See also the next article.

RAGHUVANS' A (from *Raghu* [q. v.] and *vans'a*, race or family, hence 'the family of Raghu') is the title of one of the most celebrated poems of Sanscrit literature, attributed to the authorship of Kālidāsa (q. v.). It consists of 19 sargas—i. e., sections or cantos—and its subject-matter is the legendary history of the kings of the solar race, beginning with that of Dilīpa, the father of Raghu, and ending with that of Agnivarn'a. The text of the poem, with an excellent Latin translation of it, was published by Professor A. F. Stenzler (London, 1832); the text, with a prose interpretation in Sanscrit, by Pandits of the Sanscrit College of Calcutta (1831); and the text, with the complete and important commentary of Mallinātha, by Girīśachandra Vidyaratna, one of the professors of the government Sanscrit College (Calcutta, 1852). Single cantos with the same commentary have also been published at Bombay and Madras.

RAGLAN, LORD, FITZROY JAMES HENRY SOMERSET, Field-marshal, G.C.B., eighth son of the fifth Duke of Beaufort, was born September 30, 1788. He entered the army in his 16th year, and in 1807, served on the staff of the Duke of Wellington in the expedition to Copenhagen. He went to the Peninsula as aide-de-camp to the Duke, and in 1812 became his military secretary. As Lord Fitzroy Somerset, his name became a household word. He was present at all the great actions of the Peninsular campaign which illustrate the career of the great commander. He was among the first to mount the breach at the storming of Badajoz, and it was to him that the governor gave up his sword. On the return of Napoleon from Elba, he served under the Duke in Flanders, and lost his sword-arm in the crowning victory of Waterloo. The very next day, he was seen practising writing with his left hand! For his brilliant military services, he was made K.C.B., and received orders from several foreign potentates. He was minister-plenipotentiary at Paris in 1815, and secretary to the French embassy from 1816 to 1819. The Duke was appointed in 1819 Master of the Ordnance, and R. again became his secretary. In 1822, he went to the Congress of Verona in attendance on the Duke, who was the English plenipotentiary. In 1827, the Duke was appointed commander-in-chief of the British army, and called R. to the Horse Guards as his military secretary. This office he held until the death of his chief in September 1852. He was then made Master-general of the Ordnance, and in October was called to the House of Peers as Baron Raglan of Raglan, in the county of Monmouth. He had previously sat in the Lower House during the parliaments of 1818 and 1826 for the borough of Truro.

While Master-general of the Ordnance, he was appointed, with the rank of general while so employed, commander of the English forces, which were despatched to Turkey in February 1854. The allied armies of Britain and France, under R. and Marshal St. Arnaud respectively, made good their landing in the Crimea. The victory of the Alma, the flank-march to Balaklava (q. v.), the cavalry charge which has made that place immortal, the sanguinary and desperate infantry-battle of Inkermann (q. v.) (which obtained for R. the baton of Field-marshal), and the siege of Sebastopol, are too well-known to need description. Unfavor-

able comments began to be made, as the campaign proceeded, upon R.'s conduct of the war. During the winter, 1854—1855, his soldiers suffered unspeakable privations, and hundreds perished in camp and on board transports for want of the food, clothing, and medicines which were in store, but could not be found in the confusion and mismanagement that prevailed. Supplies arrived; but the siege continued without much apparent success until June 18, when a general assault was ordered, and when R.'s troops, as well as the French, received a terrible repulse. R. had been suffering from a slight attack of cholera, and the disaster of June 18 weighing upon his mind, he suddenly became worse, and died of exhaustion, June 28, 1855. His remains were brought to England, and buried in the family cemetery at Badminton. R. was an indefatigable and experienced administrator. He proved himself to be a skilful tactician, although it may be doubted whether he had the qualities of a great general. He was undeniably gifted with many qualities that shone with great lustre in the field as well as in council. His demeanor in action was so calm that it excited the admiration of the French, and Marshal St. Arnaud declared that his bravery rivalled that of antiquity. His courteous and noble bearing, his gentleness of temper and firmness of mind, and his constant worship of 'duty,' invest his character with something of the chivalrous. See Kinglake's *Invasion of the Crimea*.

RAGMAN ROLL (*ragman*), a word of uncertain origin, used in ancient diplomatic language for an indenture or legal deed), the name given to the collection of instruments which record the acts of fealty and homage performed by the Scottish nobility and gentry to Edward I. of England during his military progress through Scotland in 1296, and afterwards at the parliament held at Berwick. The original instruments of homage under the seals of the parties were deposited in the Royal Treasury of England, and have almost entirely perished; but the roll in existence in the Tower preserves a record of them. Its contents were given in an abridged form in Prynne's *Records*, and afterwards printed *in extenso* by the Bannatyne Club in 1834. An especial value attaches to the Ragman Roll as containing the largest and most authentic enumeration extant of the nobility, barons, landholders, and burgesses, as well as of the clergy of Scotland, prior to the 14th c., and the only genuine statistical notices of Scotland of the period.

RAGOUT (Fr. *ragoûter*, to revive the appetite; appears to be from Lat. *re-ad-gustare*), a name much less in use now than formerly, for a dish of stewed meat and vegetables, usually flavored with herbs and other condiments. It differs but little from the *olla* of the Spaniards and the *pilau* of the Turks.

RAGS. Fragments of nearly all textile materials have now a commercial value; those of cotton, linen, and hempen cloths are used in the manufacture of Paper (q. v.); and woollen and worsted rags are made available for respinning either alone or mixed with fresh wool, whilst the refuse is ground into powder, dyed various colors, and forms the material called flock, used by the paper-stainers to produce their ornamental flock-papers. The trade in rags is enormous. Linen and cotton rags to the extent of from 15,000 to 16,000 tons per annum, of the value of nearly £300,000, are now imported by British paper-makers, and perhaps quite as large a quantity is collected at home. The greatly increased use of esparto makes the import of R. of less cardinal importance than it used to be to the paper-makers of this country. See **SHODDY** and **RAG TRADE**.

Raguly.

RAGU'LY, in Heraldry, a term applied to an ordinary whose bounding lines are furnished with serrated projections.

RAGU'SA (Slav. *Dubrovnik*, Turk. *Paproenik*), formerly an independent republic, now a decayed episcopal town and seaport of Austria, in the crown land of Dalmatia, lies at the base and on the steep slopes of Mount Sergio, 40 miles west-north-west of Cattaro. Its higher streets communicate with its lower by means of flights of steps. It is surrounded on the land side by double walls, surmounted by old towers. Immediately south of the town is a harbor, which admits only small vessels; but two miles west is Gravosa, the proper harbor of R., and which offers secure and spacious accommodation to the largest vessels. The trade of R., which was once extensive and profitable, has sunk, and its inhabitants, 7000 in number (about a sixth of the former population), support themselves by the manufacture and export of oil (very excellent), soap, liqueurs, malmsey wine, silk, leather, and tobacco. R. also carries on a considerable transit trade with Turkey by means of Turkish caravans, about 200 of which—in all about 7000 horses—visit the town annually.

R. is supposed to have been founded in 656 by refugees from Old Ragusa (the ancient *Epidaurus*, situated 10 miles south-east), which was at that time destroyed by a tribe of Slavonians. It formed itself after the model of Venice, into an aristocratic re-

public, governed by a rector. In 1358, it placed itself under the protection of Hungary, and later it became tributary to the Porte. Napoleon, in 1805, abolished the republican government of R., and incorporated the town with the province of Dalmatia. After 1814, the town, together with the province, came into the possession of Austria.

RAGUSA, an old town in the south of Sicily, in the province of Syracuse, and 80 miles west-south-west of the city of that name, stands on a narrow and steep ridge between two ravines, on the right bank of the Ragusa, and about 15 miles from the sea. In the cliffs below the walls and around the town, ancient tombs of various shapes have been hollowed out. R. is supposed to occupy the site of the ancient *Hybla Minor*. Pop. (1872) 21,546, who manufacture cotton, woollen and silk goods.

RA'GWORT, the common English name of those species of *Senecio* (q. v.) in which the heads of flowers have a spreading ray,

Common Ragwort (*Senecio Jacobaea*).

the involucre has small scales at the base, and the leaves are pinnatifid. The British species are large coarse weeds, with erect stem, and yellow flowers; onespecies, the **COMMON R.** (*S. Jacobaea*), a perennial, is too plentiful in many pastures. It is refused or disliked by horses, oxen, and sheep. It generally disappears from thoroughly drained land, at least after a little labor has been expended in grubbing up its roots. The fresh herbage has been used to dye wool green, but the color is not permanent.

RAG-STONE, an impure limestone, consisting chiefly of lime and silica, much used in Kent. It breaks up into pieces about the size of a brick, and is hard and flat bedded. The name is also applied to the hard irregular rock which frequently overlies better building materials. Besides being used for building purposes, hones or sharpening stones for scythes and other large blades are made of it.

RAG TRADE. This trade, even within the limits of a generation, has undergone extraordinary changes. Woollen rags, which some thirty years ago were all allowed to rot on the dunghill, save the very small quantity required for flock papers and stuffing saddlery, are now consumed, under the name of 'shoddy,' to a vast extent in the manufacture of the cheaper woollen cloths, more than 30,000 tons having been imported in 1872; and in the same year, probably a like quantity was obtained in Great Britain itself.

Linen and cotton rags are, as is well known, nearly all consumed in the manufacture of paper; but of late years the demand for paper has increased at so great a rate, especially for the American and colonial markets, that rags can no longer be looked upon as the principal raw material from which it is made. It was stated by Mr. Routledge, to whom the country is mainly indebted for the successful introduction of esparto fibre, at a meeting of the London Society of Arts, in December 1871, that rags were now used alone only for the paper of bank-notes, ledgers, and such-like special purposes, esparto fibre being even preferred as a material for printing-paper. Wood pulp is also largely used on the continent, as well as in America, to mix with rags for all kinds of papers, often forming as much as 70 per cent. of their weight. For some time past, the amount of cotton and linen rags annually imported into Great Britain has been below 30,000 tons; while the imports of esparto and other vegetable fibre reached, in 1880, the amount of 191,229 tons. Moreover, no less a quantity than 11,000 tons of rags and other paper material, but chiefly rags, were exported from British ports, nearly the whole of which went to the United States.

Unfortunately, there seems but too much reason to fear that the regular supply of esparto, as the staple material for paper, cannot

be depended upon; and even though it could, rags will always be of great value for the better kinds. The consumpt per head of the population in the various countries differs, of course, very largely. In an average year, between 1870 and 1880, the consumpt has thus been estimated: In Russia, 1 lb. per head of the population; Spain, 1½ lb.; Mexico and Central America, 2 lbs.; Italy and Austria, 5 lbs.; France, 7 lbs.; Germany, 8 lbs.; United States, 10½ lbs.; and Britain, 11½ lbs. Britain had 385 mills, producing annually 360,000 tons of paper, valued at £20,000,000. When the continent had more rags than it required, England and America had to import rags to keep their mills going. The state of matters is still the same as regards the continent; but, in the meantime, the increased use of esparto appears to admit of England sending away as many rags as she imports. Most of the imported linen rags come from Germany and France. Cotton, flax, and jute waste from spinning-mills are all used for paper-making.

It is believed that the home supply of linen and cotton rags might be largely increased by greater care in housekeeping economy. Mr. Herring, partner in a firm of paper-merchants, and author of several articles on this branch of industry, published, in 1880, a 'Letter,' addressed to clergymen and others, suggesting an organized plan for the attainment of this object. 'There are,' he remarks, 'more rags wasted, burned, or left to rot, than would make our paper-manufacturers independent of all assistance from abroad.' Whatever may have been the case in 1860, it is plain that, however carefully collected, all the rags produced in Great Britain would now be far short of meeting the demands of our paper-mills if no other material were used.

The managers of the ragged schools in London organized a *Rag-collecting Brigade* in 1863 for the systematic collection of the rags of the metropolis.

RAHDUNPUR, a large fortified town of Hindustan, in a protected state of the same name, in the north-west of Guzerat, about 150 miles north-west of Baroda. The majority of the inhabitants, who are chiefly Rajuts and Coolies, are engaged in agriculture; trade and manufactures, however, are carried on to some extent. Coarse cotton cloths—the staple manufacture—and grain, leather, and hides are exported. Pop. 15,000. The state of R. which is under British protection, has an area of 850 square miles, and a pop. of 91,500. The climate, very hot during October and November, is delightful from December to April.

RAHU is, in Indian Mythology, the demon who is imagined to be the cause of the eclipses of sun and moon. When, in consequence of the churning of the milk-sea, the gods had obtained the Amrita, or beverage of immortality, they endeavored to appropriate it to their exclusive use; and in this attempt they had also succeeded, after a long struggle with their rivals the Daityas, or demons, when R., one of the latter insinuating himself amongst the gods, obtained a portion of the Amrita. Being detected by the sun and moon, his head was cut off by Vishnu; but the Amrita having reached his throat, his head had already become immortal; and out of revenge against sun and moon, it now pursues them with implacable hatred, seizing them at intervals, and thus causing their eclipses. Such is the substance of the legend as told in the *Mahābhārata* (q. v.). In the *Purāṇas* (q. v.), it is amplified by allowing both head and tail of the demon to ascend heaven, and produce the eclipses of sun and moon, when the head of the demon is called *Rāhu*, and his tail *Ketu*, both, moreover, being represented in some *Purāṇas* as the sons of the demon *Viprachitti* and his wife *Sinhikā*. In the *Vishṇu-Purāṇa*, R. is also spoken of as the king of the meteors.—In Hindu Astronomy, R. is personified as the moon's ascending, and Ketu as the moon's descending, node.

RAHWAY, a city of New Jersey, U. S., on the Rahway River, 5 miles from its mouth, and the New Jersey Railway, 19 miles west of New York. It contains numerous manufacturing establishments, a large proportion of which are for carriages. Pop. (1860) 7130; (1870) 6258.

RAIKES, ROBERT. See **SUNDAY SCHOOLS**.

RAIL (*Rallus*), a genus of birds of the order *Grallæ*, and family *Rallidæ*, having a slender bill, longer than the head, the body of a very compressed form, wings of very moderate length, a very short tail, long and strong legs, and long toes. The only European species is the **COMMON R.** or **WATER R.** (*R. aquaticus*), sometimes called *Bilcock*, a bird which occurs in almost all parts of Britain and is not unfrequent in marshy situations and the reedy margins of lakes and rivers; although it often eludes observation, threading its way among reeds—for which its compressed form seems specially adapted—and diving when compelled to betake itself to open water. It does not rise, except in extreme necessity; and when flushed, flies heavily. It is more plentiful in most parts of the continent than in Britain; and is there generally a bird of passage, breeding in the north, and migrating southward on the approach of winter. It makes its nest of coarse grass and sedges among thick aquatic plants. The whole length of the bird is

about eleven inches and a half. The sexes are very similar in plumage, olive-brown, marked with black above; bluish-ash color beneath, with white transverse markings on the belly.

The water R. feeds on worms, molluscs, and soft vegetable substances. It is in the highest esteem for the table.—America produces a number of species of R., as the **VIRGINIAN R.** (*R. Virginianus*), a species rather smaller than the Water R. of Europe, and much resembling it in its habits; a bird of passage, and in many parts of North America very abundant; the **GREAT RED**

Water Rail (*Rallus aquaticus*).

BREASTED R., or **FRESH-WATER MARSH HEN** (*R. elegans*), a much larger bird, fully 20 inches in length, inhabiting the extensive marshes of the southern states of North America; the **CLAPPER R.**, or **SALT-WATER MARSH HEN** (*R. crepitans*), extremely abundant in the salt-marshes of the same regions, its whole length about 15 inches; all of which are much esteemed for the table, the eggs of the Clapper R. being also collected in great numbers as a delicacy. The name Clapper R. is from the cackling cry which the bird seems to delight in emitting.—The **MANGROVE HEN** (*R. longirostris*) abounds on the muddy shores of the West Indies, and its flesh is held in the highest esteem.—In general form, and in the character of their plumage, all these and other species are very similar.

RAILS, in Architecture, are the horizontal bars in panelled stone or wood work, such as doors, shutters, &c., which enclose the panels, the upright pieces being termed styles. The word is also applied to the level piece over balusters or between posts.

RAILWAYS. The origin of these now vast undertakings is traced to a contrivance for simplifying the transit of coal from the mines in Northumberland and Durham to the places of shipment on the Tyne and Wear. The invention consisted of a double parallel line of wooden beams or trams fixed to the ground, and furnished with flanges to prevent the wheels of vehicles from slipping aside. Along these flanged beams wagons were drawn by horses with such comparative ease, that instead of a load of 17 cwt. by a common road, a load of 42 cwt. could now be drawn by a single horse. These new thoroughfares, called tramways, were made across fields, the proprietors of which received a certain rent for the way-leave or use made of them—which term, way-leave, is still employed in arrangements of this kind. To the coal districts of the north of England, therefore, is indisputably due the simple yet meritorious contrivance which, from less to more, led to the modern railway, with all its wonderful machinery; nor is it useless to note, that the invention, in its early stages, owed nothing to men of education or high scientific attainments, but was mainly the work of obscure mechanics and illiterate enthusiasts.

The date of the invention of tramways is uncertain, but by good authorities it is referred to the period between 1602 and 1649. From the northern coal districts it gradually came into use in other mining districts in England, as also in the south of Scotland. The 17th c. was not favorable to mechanical improvement. Not till about 1700 was there any marked advance on the original tramway. The first step was the clothing of the wooden beams with long slips of iron, to prevent excessive wear and tear. This also being found defective, a second and more complete improvement, about 1740, was the substitution of cast-iron rails fixed in parallel lines on cross wooden sleepers. This species of railway became pretty general in mining districts between 1745 and 1775. In the former of these years, one was in operation in Scotland—namely, a short coal-line from Tranent to Cockenzie, which General Cope selected as a position at the battle of Prestonpans. Though now considerably improved, railways did not attract attention as being suitable for general traffic. The success of canals not only turned the public mind in that direction, but raised up a powerful canal interest, which viewed the progress of railways with extreme jealousy and ill-will.

The use of cast-iron rails led to an improved method of traction. Instead of employing a single large wagon, the plan of linking together a series of smaller wagons was adopted—the germ of the modern train. The next improvement consisted in putting flanges on the wheels instead of the rails, by which great facility

of transit was afforded. The draught still continued to be executed by horses; but as the railway system seemed to possess immense capabilities of expansion, many minds labored in devising schemes to substitute steam-apparatus. The invention of the locomotive, like that of railways, was the work of successive geniuses. Watt had shown the practicability of fixed steam-engines; what was now wanted was an engine that would travel by its own internal impulse. The merit of inventing a self-acting steam-carriage is allowed to be due to Richard Trevethick, a clever but eccentric engineer. In 1802, he took out a patent for a steam-carriage, and this novel machine he exhibited to large crowds of admiring spectators on a piece of ground near London. Immediately afterwards, he adapted his carriage for the drawing of wagons on railways, a duty which it successfully executed on the Merthyr-Tydvil Railway in 1804. This was the first locomotive; but it was far from perfect. It drew only 10 tons of bar-iron at the rate of five miles an hour.

Trevethick did not remain in England to improve on his invention, nor did the moderate achievements of his machine immediately induce others to make any distinct advance on his ingenious contrivance. For this lethargy there were various causes; but the principal consisted in a universal belief among engineers, that the locomotive could not be expected to gain great speed, to ascend a moderate incline, or to draw a heavy load, unless the wheels were provided with a cogged rim to work on a corresponding rack along the rails. Numerous schemes were made the subject of patents to overcome this imaginary difficulty—a circumstance which gives one a poor opinion of the state of engineering knowledge at the beginning of the 19th century. That locomotives running with smooth wheels on smooth rails, by mere weight and friction, as exemplified by Trevethick, could draw heavy loads up a moderate incline, was at length, in 1811, established as a fact by Mr. Blackett, a coal-proprietor, on the Wylam Railway. The means for imparting speed alone remained to be given.

Locomotive power was employed by George Stephenson (q. v.) on the Killingworth Railway in 1814, and with such success, that it was afterwards applied on the Stockton and Darlington Railway, for which the first act of parliament was passed in 1821. In this last undertaking, Stephenson was encouraged by the generous and enlightened aid of Edward Pease, a member of the Society of Friends, whose name will always be associated with the history of railway enterprise. The Stockton and Darlington was the first railway in which carriages traveled with passengers; yet, even with the measure of success so secured, the locomotive was still an imperfect machine, for its rate of progress continued to be little faster than the walk of a horse. Acceleration was now the grand desideratum, and it was attained by using a very simple contrivance—that of sending the waste steam up the chimney, so as to cause a powerful draught in the fire; a rapid generation of steam was the consequence, and by this appliance, along with the multitubular boiler, the machine shot forward with an energy hitherto unknown (see STEAM-ENGINE).

It certainly seems very strange, that notwithstanding the proved feasibility of railways, the public at large could not be stimulated to give any heed to the subject. It was shown in this, as in the analogous case of steam-boats, that the world may remain sceptical of an invention long after it has been practically established beyond cavil. The idea of extending railways over the kingdom for general traffic was perhaps first conceived by Thomas Gray of Nottingham, who, full of enthusiasm, besieged the public, and memorialized the government on this his favorite project, between 1820 and 1824. A work embodying his views, *Observations on a General Iron Railway, &c.*, was published in 1820. Gray's ardent notions met with little favor. Unfortunately, he was no mechanic, and, seemingly unacquainted with the advances which had been made, labored under the old exploded belief, that locomotives must have cogged wheels. After Gray, there appeared another projector, William James of London, who, in 1822, endeavored without success, to establish a railway between Liverpool and Manchester. Opposition caused his plans to be laid aside. The next and more fortunate projector was Joseph Sanders of Liverpool. He issued the prospectus of a railway from Liverpool to Manchester, 29th October 1824; and this line, surveyed by Stephenson, was, after much unworthy opposition, and some changes of route, sanctioned by the legislature. It was formally opened for traffic, September 15, 1830. Provided with some of George Stephenson's improved locomotives, the success of the line was immediate and complete—in fact, the great railway system was inaugurated.

Now, properly speaking, began that course of commercial enterprise, unregulated, and often wasteful, which has since assumed such importance. Refraining from all control over railway operations, the government, left speculators to carry lines anywhere or anyhow that parliament could be persuaded to sanction. The result, as it is well known, has been in many places a complication of competing lines on no principle of economy or enlightened foresight. Abandoned, as it were, to the audacity of promoters,

and the mere brute force of capital, schemes, good, bad, and indifferent, had to fight their way at a cost almost exceeding belief; while at the same time there has been much waste of money in allowing circuitous lines to places which are afterwards in a great measure, superseded by others more direct.

LEGISLATION AND MANAGEMENT.—In the United Kingdom, railways are the property of independent companies, who construct and work them under the provisions of acts of parliament. The first step consists in organizing a company. Generally, a solicitor and a few active projectors draw up a prospectus, call meetings, suggest the names of directors, and appoint an engineer to make a survey. In no case does government or any public body take any part in the initiatory proceeding, or find any part of the capital. By the engineer and solicitor there is much to be done at the outset. Having procured a copy of the survey, the solicitor has to discover the name of every proprietor whose land is interfered with, as well as every tenant or occupant; all which names, with the extent and nature of the land to be taken, are entered in a roll, called the *Book of Reference*; and with every person so concerned, a schedule must be lodged, stating all particulars. The recipients of the schedules are requested to state in reply, whether they design to assent, to oppose, or to remain neutral; by which means, the mind of every one territorially interested becomes known to the promoters. Land to be taken for, or damaged by, railways is valued under different categories: 1. The quantity and quality at so much per acre; 2. The injury caused by cutting off one part of a field from another, called intersectional or severance damages; and 3. The damage done to the amenity or beauty of the place. Besides claiming compensation on these different grounds, the proprietor demands, for the sake of convenient communication, that bridges or level crossings shall be made across the line, or that passages be left beneath it; also that all ordinary means of drainage be maintained by culverts. Sometimes, he stipulates for a siding or station. Should the lands be let to a farmer, as is very generally the case, he is treated with separately for the loss he is likely to sustain during his lease, including any loss by unexhausted manure in the lands appropriated.

Being thus compensated for his claims, the farmer continues to pay his rent as usual, without deduction, according to the obligations of his lease, and any question is saved between landlord and tenant. Such is an outline of the usual method of settling 'land-claims,' though much depends on the feeling on both sides. At one time, enormous sums were asked and paid for alleged damage to land; now, the claims are more moderate, and in few instances is damage to amenity an element of consideration.

Until a statutory enactment is procured, the shares of a company are in that embryo state called *scrip*. Allotted to applicants by the provisional directors, the shares are 'taken up' by paying a small instalment of from 5s. to 20s. per share. These preliminary sums are paid in to a specified bank, the receipt of which is the scrip or certificate that so frequently becomes the subject of eager transfer among jobbers. The bank deposits of the allottees constitute the fund from which are paid—1. Expense of survey; 2. Expense of advertisements, prospectuses, &c.; 3. Parliamentary expenses; and 4. The amount to be lodged with an officer of government as a guarantee that parliament shall not be troubled with a merely pretended scheme. Should the bill not pass, the sum last mentioned is returned, and is, along with any residue, divided *pro rata* among the holders of scrip. Should the bill become law, scrip-holders are required to present their names with the amount of their respective shares for register at the office of the secretary of the company. 'Calls' are next made on the shareholders. If the shares be £10, a call of £2, 10s. per share, at intervals of three months till the whole is paid, is customary. Any failure to pay calls by a prescribed day incurs the risk of forfeiture. In authorizing a company, parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the stock, but it cannot be legally borrowed until all the shares have been issued, and at least one-half of all the shares has been paid up. The lender has a mortgage over the whole property of the company, called a *Debenture* (q. v.).

The entire amount paid for shares and borrowed on mortgage forms the 'capital account' of the company. See CAPITAL ACCOUNT, in which an explanation is offered of the manner of disbursing from capital and also from revenue; it being from revenue alone that dividends can be legally paid.

The act which authorizes the undertaking constitutes the company a corporation, the members of which are responsible only to the extent of their respective shares. In the act, the names of the first directors are given; it is also stated who are first to retire, and how elections are to be conducted. A director must possess a prescribed amount of stock. The directors are empowered to appoint from their number a chairman and deputy-chairman. They likewise have the appointment of secretary, traffic-managers, and other paid officials. The directors themselves profess

to give their services without any species of remuneration; but the shareholders usually vote a small sum to be put at their disposal, adequate to meet absolutely necessary expenses. Where the duties are very onerous, a special allowance per annum is voted to the chairman. It is likewise customary for the directors to have free passes over the line, which privilege is also enjoyed by the secretary and some other officials. In some instances, a free pass for a day is given to the shareholders to enable them to attend the stated half-yearly or special meetings. The principal business at the half-yearly meetings is the reading and approval of the 'report' of the directors. As the report is always printed and circulated previously, all are prepared to discuss its merits.

The organization of the present railway system has not depended on the private acts authorizing the several undertakings. There is now a body of general railway law, springing from a number of public acts, which have from time to time received the grave consideration of the legislature. These statutes date from 1838 onwards; some of the more important were passed in 1845; among these were several comprehensive statutes, including 'The Companies Clauses Consolidation Act,' and 'The Companies Clauses Consolidation (Scotland) Act,' also 'Railway and Lands Clauses Consolidation Acts,' to which supplementary acts were added in 1863, in 1864, in 1867, and in 1871. Among the diversity of matters treated of are as follows—obligations as to carrying mails, and conveyance of troops and police; regulations as to gates at level crossings, signals, and junctions; penalties for obstructing engines or railway officers, and trespassing on lines; limitations of gradients and curves; gauge; time within which railway must be made; notices to be given to Board of Trade before line can be opened, and not to be opened without authority, after due examination of works; returns to Board of Trade as to accidents; maintaining of fences; making of sidings for farming and other purposes; one cheap train to be run each way daily; rules for registering and transferring shares; voting according to ratio of shares held; payment of poor-rates and public assessments; leasing of lines; agreements to work lines; surrender of shares; authority to buy, hire and use steam-vessels; &c.

Besides these public acts, there is a code of regulations as regards the mode of commencing and carrying railway bills through the Houses of Parliament. This code, embodied in a work issued annually, is styled *Standing Orders of the Lords and Commons relative to Private Bills* (1 vol. 12mo, issued by Waterlow and Sons, Westminster). With this, all parties engaged in procuring railway acts require to be well acquainted, for neglect of any of the prescribed forms is almost certain to be fatal.

We give the following as specimens of 'Standing Orders': Notices of applications for acts to be advertised in October or November; plans, sections, and books of reference to be lodged with clerk of the peace or sheriff-clerk of county for public inspection, on or before 30th November [often an immense struggle up till last moment to get this done]; petitions for act stating particulars to be lodged at the Private Bill Office of the House of Commons on or before 23d December; on or before same date, copy of proposed bill to be lodged with Board of Trade; on or before 31st December, declarations, lists of owners, lessees, and occupiers, also estimate of expense, to be deposited in Private Bill Office; a sum not less than 8 per cent. of the estimated expense to be deposited with the Court of Chancery, England, an officer of the Court of Exchequer, Scotland, or Court of Chancery, Ireland, previous to 15th January; examination of petitions to commence on 18th January; if promoters do not appear after a notice of seven clear days, examiners may throw out petition; certification by examiners whether standing orders have been complied with; bill submitted to select committee; proceedings in opposed bills; report of Board of Trade on bill; report of Board of Admiralty on bill, should any tidal or navigable river be proposed to be interfered with; preamble of bill proved or otherwise; bill to give power for future revision by parliament, &c.

There are equally explicit standing orders as regards the House of Lords, whose chairman of committees subjects all private bills to a sifting examination. Whatever, therefore, may have been the negligence of the government at the outset, railway legislation has latterly received a painful degree of attention. As marking a desire for simplifying procedure and lessening expenses, parliament passed an act, 1864, giving the Board of Trade power to authorize bills for a smaller class of railways, provided they were unopposed—a concession which may promote a minor but useful kind of branch-lines.

In issuing the prospectus of a railway, an estimate is given of the probable amount of traffic of all kinds; but in every case, sometimes to a surprising degree, the traffic exceeds expectation. Railways have not improperly been compared to navigable rivers. To inland and not easily reached towns, they impart the character of a seaport placed in ready communication with all the world. The exciting of a desire to travel, and the developing of local trade and resources, accordingly attend on railway undertakings,

and the consequence is a universal activity and prosperity, and the creation of wealthy industrial centers.

Railways were at first detached undertakings between one large town and another, but now many of the companies have for mutual advantage amalgamated in groups; and in a number of cases for economy in working, lesser lines have been leased to companies of larger means. In this, as in most other commercial concerns in Great Britain, the tendency is to concentrate business in the hands of monopolists possessing large capital, or at least those having a great capacity and disposition to borrow. One of the advantageous results of a union of railway interests is, that passengers are able to procure 'through-tickets' to carry them forward for hundreds of miles without delay or change of carriage; but it is not less conspicuous that the 'railway interest' has become a formidable power in the state, and is able to carry lines almost anywhere, in disregard of land-proprietors or town-authorities, as if the destruction of rural amenity and the wholesale ruin of dwellings were matters of perfect indifference. Making every allowance, therefore, for the high social value of the railway system, it has certainly reached a point of despotic overbearance that requires some species of control more effectual than that which is embraced in the irregular action of parliamentary committees or of the Board of Trade.

This question has lately been attracting much attention. The government has tried in various ways to ameliorate the evils arising from its early apathy, and to control the excesses of railway enterprise. The latest of these efforts was the appointment of a Joint Committee of Lords and Commons, and a bill based on the report of that committee was in 1874 before parliament. One of the conclusions arrived at by this committee is worth noting: 'That no means have yet been devised by which competition can be maintained. Nor is there any reason to suppose that the progress of combination will cease until Great Britain is divided between a small number of great companies.'

Two great propositions for amalgamation made recently have been negatived by parliament. It remains to be seen whether the act will prove more successful than antecedent legislation. Its principal feature is the appointment of a mixed tribunal—composed of three eminent men—for the regulation and control of the working of railways.

The only alternative proposed to the present system is the government purchase of railways. An act of parliament was passed in 1844 for the purpose of enabling government to purchase all lines after they had respectively been 21 years in existence, dating from the passing of the act. This statute came into operation in 1865, but the Joint Committee of 1872 report that they do not think the terms of the 1844 act suited to the present condition of railway property, or ever likely to be adopted by parliament.

There is much to be said on both sides of this question; most of the arguments advanced *pro* and *con*. may be found in articles respectively in the *Quarterly Review* and *British Quarterly Review*, April 1873.

CONSTRUCTION.—Railways in the United Kingdom are of two kinds—double and single. The double consists of two lines of rails—an *up*-line, conducting towards, and a *down*-line, leading from the metropolis or principal center of traffic. By far the larger number of lines are of this double variety. Single lines, with places where trains may pass each other, are mostly of recent construction, and have received their chief development in Scotland. On some of the main lines to London it has been found necessary to add a third, and in some cases a fourth line, to accommodate the enormously increased traffic. Whether double or single, all the lines are enclosed. At the chief terminus there is a group of buildings for offices, workshops, sheds for locomotives, &c. Within late years the terminal stations at the larger towns have assumed vast proportions, and in them comfortable waiting and refreshment rooms are provided. In many cases, also, hotels on a very large scale have been erected as part of the buildings at the termini.

The construction of a railway is the business of contractors, who execute the works by estimate, according to the plans and specifications of the engineers. A railway contractor is a capitalist with a practical knowledge of earth-digging, blasting rocks, pumping, embanking, boring, and building tunnels, erecting bridges, and other rough operations. He possesses a stock of the various necessary apparatus, light rails, tools, &c., including horses, wagons, and locomotives for dragging materials. He has subordinates called time-keepers, foremen, gangers, and under-gangers, placed over detachments of operatives. These operatives are a remarkable class of men. Originally from Lincolnshire and Lancashire, they are popularly known as *navvies* (contracted from 'navigators'), from having been engaged in excavating navigable canals. Navvies sometimes labor in bands, called *butty-gangs*, by piece-work, and are known to draw large sums, but more generally they are employed at days' wages.

Signals.—The signalling arrangements form an important part of railway construction. The most common form of signal is

the semaphore, and at night, colored lights. A red light signifies danger; a green, caution; and a plain light, that the line is clear. Much care is given to the arrangement and construction of crossings, junctions, &c., with their numerous *switches*, or movable rails, used for changing the direction of a train from one line to another. The *switches* are generally worked directly from the signal-stations, and are so arranged that their points shall not face towards the advancing traffic. Numerous accidents have been caused by 'facing points.' Many improvements have been lately introduced in signalling, crossings, &c., all with a view to increased safety. The 'block' system has been adopted by the principal railway companies, particularly in the neighborhood of busy centers of traffic. Under this system each signal station is in direct telegraphic communication with the nearest signal-stations, both up and down the line, and a train is not allowed to pass any signal station until the train immediately preceding it has started from the next station in advance. Thus the driver may push on without hesitation from point to point; and thereby the traffic is expedited, and at the same time safety increased. The system of *interlocking* has also been extensively introduced. Under this system, the pointsman can only *lower one signal*—namely, that which corresponds to the line which, from the position of the switches, is *clear*; and before he can alter the position of the switches, he is compelled to return this signal to 'danger.'

Curves and Gradients.—Engineers endeavor to render their lines as level and straight as possible, but circumstances often necessitate the use of considerable curves and gradients. As a general rule, there are few curves of less than three-eighths of a mile, or 30 chains' radius; when they are employed, the exterior rail is super-elevated, to counteract the centrifugal force, otherwise a quickly moving train might leave the rails. Gradients being expensive to work according to their degree of inclination, few are more steep than 1 in 60, though 1 in 30 is not unknown. On steep gradients, stationary engines were sometimes employed, but in nearly every case, these have been abandoned for locomotive power. On local and private lines, much steeper gradients and sharper curves are common. One of the earliest, if not the first trial of a locomotive on an incline of 1 in 12, was made in Scotland in 1862. One of the Brazilian railways has a gradient of 1 in 10, with smooth-wheeled locomotives.

Gauge and Earth-works.—In the early stage of railway operations, the gauge or width between the rails excited considerable discussion. When wayleaves, or tramways, were introduced in the coal districts, their gauge was adapted to the common road-wagons that were to be put upon them, and it happened that the gauge between the wheels of these wagons was 4 feet 8½ inches. Accustomed to this width, George Stephenson believed that it 'was most economical in construction, not only as regarded the engines and carriages, but more particularly of the railway itself.' This gauge was accordingly adopted on most of the earlier-made railways, and notwithstanding the keen contests of engineers, who were generally favorable to a 5 foot or 5 feet 3 inches gauge—Brunel contending for 7 feet—this original 4 feet 8½ inches gauge—measured from the inside of one rail to the inside of the other—was irrevocably fixed by a public act, 1846, as applicable to all the railways in England and Scotland, the Great Western and certain branches excepted, on which the gauge was regulated at 7 feet. Owing to inconvenience in communicating with other lines, and from other causes, the Great Western has found it advisable to conform to its neighbors, and has now relaid its lines on the standard gauge. By the same act, the gauge in Ireland was fixed at 5 feet 3 inches. The government of India fixed the gauge of all the railways in that country at 5 feet 6 inches. But a movement in an opposite direction has set in within the last few years, and the battle of the gauges is renewed.

A horse tramway at Festiniog in Wales, constructed in 1832 for the conveyance of slates from a quarry, and laid with a 1 foot 11½ inches gauge, was, in 1868, transformed into a locomotive railway for passengers and goods, and was found to work with perfect safety, and with remarkable economy. The success of this experiment has awakened the attention of many engineers to what they believe to be the needless extravagance of the standard gauge; and railways with gauges varying from 2 feet 6 inches to 8 feet 6 inches are now in operation in the Isle of Man, Norway, Sweden, Russia, Queensland, Peru, Chili, Brazil, Canada, and the United States, where a vast mileage is built or in course of construction. The great argument for the narrower gauge is the obvious economy both in first cost and in working. It is calculated that, on an average, companies have to haul over their lines seven tons of dead-weight in order to carry one ton of goods; and in the case of passenger carriages the excess is even greater. With the whole apparatus on a smaller scale, this waste is greatly reduced. Another advantage of the narrow gauge is, that much sharper curves may be adopted than are possible on the broader one, and thus the route may be chosen to much greater advantage. While it may be an open question whether the narrow gauge is adequate for a thickly peopled district, where 'express'

trains may be indispensable, and where traffic may at times be exceptionally heavy, it is, without doubt, especially suitable for sparsely peopled districts and half-developed territories. Indeed, it affords the means of supplying the benefits of railway communication where otherwise they would be hopeless. After careful investigation, the Indian government of the late Lord Mayo decided to adopt the metre gauge, about 3 feet 3 inches, for the greater part of an extensive series—1500 miles—of state railways. In Canada, there are already over 6000 miles of railway with a gauge of 4 feet 8½ inches (there called 'medium' gauge).

Ballast.—This is the name given to the mass of broken stones or dry gravel on which the sleepers are placed, and which serves to keep them steady. Material for ballast is generally got in the cuttings or near the line, but it is often brought a considerable distance. The term *ballast* originated in the practice of using the gravel-ballast emptied from the ships in the Tyne, for the tram and railways in the neighborhood of Newcastle.

Rails.—Rails are generally of wrought iron, but steel rails have been extensively adopted where there is a continuous heavy traffic, and are found to reduce greatly the cost of maintenance, and promise to supersede wrought iron. Rails differ in shape and weight. The most common form is the 'double-headed' rail, which is reversible (fig. 1). Another form, which was once used on the Great Western for the broad-gauge line, is known as the 'bridge-rail'; and a form frequently used on the continent, and generally on narrow-gauge lines, has a flat base formed by a flange on each side of the vertical web. The last two descriptions do not require *chairs*, but are fastened directly to the sleepers by spikes. Rails are generally 21 or 24 feet long, and for light railways vary in weight from 20 to 45 lbs., and for heavy lines from 60 to 80 lbs. per lineal yard. Cross sleepers are laid at 2 feet 6 to 3 feet 6 inches apart, usually about 3 feet, and on these sleepers the *chairs* of cast-iron are fixed and held firmly down by iron spikes driven into the sleepers. The ends of the rails are now almost always joined together by a plate of malleable iron placed on each side, called a fish-plate; two of these are used at each joint, and are bolted together by strong bolts passing through the rails. In the joining of the rails end to end, to make a smooth surface, great care is bestowed; perfect steadiness in the required line of direction is secured by means of wooden wedges acting on the rails and the chairs.

Hitherto, the sleepers have been of seasoned native larch, as the most durable; but latterly, from the growing scarcity and cost of this article, sleepers have been made of imported timber from ports in the Baltic. They are sometimes *creosoted* to render them durable, but generally they are found to require renewal on account of splitting before they rot. Many patents have been taken out for methods of dispensing with wood sleepers, and substituting some more lasting material. Some of them are extensively used abroad, but they are scarcely to be found in this country.

Tunnels and Viaducts.—Tunnels are avoided as far as possible on account of their costliness. They are made only when the excavations would be more than 60 feet in depth, or when land-proprietors force their adoption, in order to spare the amenity of grounds near a mansion. For this latter reason, some short tunnels are known to have cost railway companies as much as £50,000. Latterly, the execution of underground railways in the metropolis has offered examples of tunnelling more extensive than were previously known in England, and at the same time popularized a method of subterranean transit almost as marvelous as anything in the way of viaducts. The Woodhead Tunnel is probably the longest in Britain, being 3 miles 60 feet. (The Channel Tunnel to France, if carried out, would extend some 20 miles beneath the British Channel.) In the first of the great continental tunnels, the Mont Cenis Tunnel, the summit level is 4246 feet above the sea. It was completed in 13 years, at a cost of about £3,000,000, the total length being 7½ miles, and was opened in 1870. A still greater undertaking, the St. Gothard Tunnel, was begun in 1872, and the borings from opposite sides met early in 1880. The length of the tunnel is 9½ miles: the contract, ultimately much exceeded, was £2,000,000.

Viaducts are frequently of stone, and of handsome architecture, but now commonly of malleable iron girders, of various forms, set in stone or iron piers. In the construction of viaducts, there is a growing boldness of conception. Remarkable works of this kind are the great suspension East River Bridge, connecting New York and Brooklyn, more than a mile long, the central opening having a span of nearly 1600 feet; and the St. Louis Bridge, crossing the Mississippi by three arches, the center span being 520 feet. But the longest bridge in the world was the railway bridge across the Firth of Tay, near Dundee. It was of iron girders: its length was 3450 yards, in 85 spans, 90 feet above high water, and it cost £350,000. During a wild storm in December 1879, 400 yards length of the bridge fell into the river. A scheme for replacing the bridge at a lower level was soon brought forward.

Fig. 1.

The building of a great suspension-bridge across the Firth of Forth, abandoned in 1880, was resumed in 1882.

Cost of Permanent Way.—Owing to the obstructions offered by landowners, and their excessive claims for amenity damages, also the opposition of rival companies, the cost of railways was at one time very much greater than it is at present. The expenditure incurred in securing legislative authority to construct railways was likewise enormous. The parliamentary costs of the Brighton Railway averaged £4806 per mile; of the Manchester and Birmingham, £5190 per mile; and of the Blackwall, £14,414 per mile. The cost of carrying the Liverpool and Manchester line was £27,000. It has been shown that the solicitor's bill for the South-eastern Railway contained 10,000 folios, and amounted to £340,000. These few facts, however, afford but a feeble idea of the reckless wastefulness of capital on railway undertakings; it is universally allowed that, under a better policy, not only a much better railway-system might have been provided, but a saving effected of at least fifty millions. At the end of 1871, the total average cost of all the railways in the kingdom was £35,943 per mile open, or about double that of any other country.

The cost of construction varies so much, that it is impossible to say definitely what would be the average cost nowadays; but in England a double line, including station-houses, signals, and all other fixed plant, would probably cost, under ordinary circumstances, from £15,000 to £20,000 per mile. Single lines are made at perhaps a fourth less, but nowhere in the United Kingdom have they been executed so economically as in Scotland. There, some single lines have cost for land and everything not more than about £5000 per mile—such economy, however, being greatly due to the fact, that the undertakings were promoted and watched over by bodies of land proprietors deeply interested in restraining expenditure. Of these cheap Scotch lines a good example is offered by the Peebles Railway (practically a branch of the North British), extending to 18½ miles, the entire cost of which, land and station-houses included, was about £95,000. The cost of rolling stock was additional.

Maintenance of Way.—Every railway, great or small, is at a considerable expense in keeping the line in proper working order, for which purpose a staff of officials is required. Besides a general superintendent there is an effective staff of 'plate-layers,' whose duty it is to watch over and repair the permanent way.

ROLLING STOCK.—Under this head are comprehended locomotives, carriages, and trucks for goods and minerals, the whole forming an important part of railway undertakings.

Locomotives.—Locomotives are of several kinds, varied in construction to suit the traffic for which they are designed. They may be classed as express, ordinary, passenger, goods, and tank engines. In the latter class the tender for fuel and water forms an extension of the locomotive, but for the most part the tender is detached, and only connected by couplings. Locomotives for ordinary traffic have generally six wheels. In the first two classes where speed is the principal object, only two, or at most four of the six wheels are *driven*, and these are made of large diameter. There has been a continual tendency to increase the speed, and this has led to an increase in the size of the driving-wheels, which are in some cases eight feet in diameter. All the wheels of locomotives for heavy traffic are coupled together, so as to utilize the entire weight for adhesion. The smaller class of locomotives have only four wheels. The present price of first-class locomotives—of the largest size in general use—including the tender, varies from £3000 to £4000. Locomotives of this class weigh in trim from 30 to 40 tons; but there are, of course, much lighter locomotives; while sometimes they are as much as 55 or 56 tons.

Carriages.—There are three distinct kinds of carriages to suit the several classes of passengers. Each first-class carriage consists of three or four distinct compartments; but in the other

Fig. 2.

classes the backs of the seats are in many cases not carried to the roof, leaving the upper part of the carriage open fore and aft. At night the carriages are lighted with lamps; on the Metropolitan lines gas is sometimes used. Special saloon-carriages are reserved for royalty. The first-class compartments are handsomely fitted up, and in winter are heated by hot-water tins. Recently, one of

the leading companies abolished its second-class carriages; and some companies now run third-class carriages with all trains. Passenger carriages made of iron have been used in America. Sleeping-carriages and the American Pullman cars have also been introduced into this country. Many efforts have been made to devise some simple and efficient contrivance by which passengers

Fig. 3.

might, in cases of emergency, summon the guard, but no plan has as yet been adopted to any extent. The 'continuous brake' is an improvement and novelty which has already been successfully tried, and is likely to be soon generally applied. By its use trains can be stopped in a much shorter time and distance than under the present system, and thus the risk of accident is reduced; brakes are fitted to each carriage, and all are simultaneously ap-

Fig. 4.

plied to the wheels. Figs. 2, 3, and 4 represent respectively a passenger carriage, a heavy coal truck without elastic buffers, and a guard's van. The latter contains space for luggage, and is provided with a look-out box, from which the guard can see along the roofs of all the carriages in the train.

Wagons and Luggage Vans.—To accommodate its traffic, every railway must be provided with a large stock of trucks or wagons for carrying goods, minerals, cattle, timber, and other articles. Except for the heaviest traffic, wagons are now very generally fitted with elastic buffers.

TRAFFIC.—The traffic on railways is of two distinct kinds—passengers and goods; with the goods we include minerals, also timber and other bulky articles. The passenger and goods traffics are placed under separate managements. Usually, there are passenger-trains and goods-trains, but mixed trains are very common on branch lines.

In almost every railway in the United Kingdom, passengers are of three classes—first, second, and third. Though from the fares charged, first-class carriages possess an air of exclusiveness, no more objection is popularly taken to them than to the use of boxes in theaters; and, indeed, they are universally recognized as an advantage, for the reason that by the comparatively high fares exacted for them, the companies are enabled to lower the charges for second and third-class passengers. On some lines, compartments are set apart for ladies if they choose to use them. Special compartments of each class are now also allotted to smokers, a custom one may contrast with the special *non-smoking* carriages common on the continent. The first-class passengers have distinct waiting-rooms at the termini and stations, with generally a waiting-room in addition for ladies; for the second and third class, there is a waiting-room in common. The several waiting-rooms are neatly fitted up, and provided with suitable conveniences, including basins and water for washing the hands—accommodations which contrast favorably with what were furnished to travelers in the old coaching establishments. The waiting-rooms are open all day to the public, and there is seldom any restriction as to going on the platforms. Tickets are sold at a wicket not earlier than a quarter of an hour before the starting of the train.

The tickets, marked in consecutive numbers, are stamped with the date on delivery, and excepting 'return tickets,' will not answer for any other day. Return tickets at a fare and a half are issued on most lines for the date of issue, or from Friday till Monday. On most lines first and second-class untransferable season tickets are issued for various periods at a considerable reduction on ordinary fares. To encourage the building of villas at a distance of ten to twenty miles from termini, by which means a

traffic may be developed, some companies give a personal ticket free for a number of years corresponding to the rental. Some return tickets and tourist tickets are available from one to six months.

The number of trains run daily depends on the pleasure of the directors. There are ordinary, mail, and express trains; of this last kind, two usually go each way daily, the fares on which are sometimes higher than by the others. Ordinary fares are about 2½d. per mile first class, 1½d. second class, and 1d. to 1½d. third class; but on some lines the fares are considerably lower. According to one of the provisions of a general act, all companies must run one train daily each way, stopping at all stations, and at a rate of speed not less than 12 miles per hour, at a fare of a penny a mile. Some of the express trains are run at very high speeds, and with wonderful punctuality. On June 1, 1872, London was brought, for the first time, within 9½ hours of Edinburgh, by a train running on the East Coast route, which, deducting stoppages, travels at an average speed of nearly 47 miles an hour. By an act, 5 and 6 Vict. cap. 79, there is payable to government 'a duty at and after the rate of £5 per £100 upon all sums received or charged for the hire, fare, or conveyance of all passengers.' By 7 and 8 Vict. cap. 85, it is enacted that no tax shall be levied on the receipts for passengers conveyed at fares not exceeding one penny per mile; but by the 26 and 27 Vict. cap. 83, it is enacted that this exemption shall only extend to trains running six days in the week, or on market-days for the conveyance of passengers at one penny per mile. From this passenger-tax Ireland is exempted.

All trains are accompanied by a 'guard,' who is responsible for their management while running. For the most part, guards are intelligent and obliging, and do all in their power to render service to the passengers. Nor must we omit to say that the porters on duty are remarkable for the trouble they take to carry luggage, find cabs at the termini, and to answer civilly such inquiries as may be put to them by strangers. It may be said with perfect justice, that in no department of affairs in Great Britain is there seen such readiness to oblige as in that connected with railways. Considering the vast number of servants on some lines—the total on all lines is probably about 300,000—the general good conduct that is shown, and the few accidents that occur, constitute a gratifying social phenomenon.

According to English routine, passengers are allowed to find their way promiscuously to the proper carriages, the only check being a call by the guard to 'show tickets' previous to starting. All passengers are expected to see their luggage labelled for the place of destination, and to point out what belongs to them on arrival. This is a loose practice, often remonstrated against, but it suits the temperament and self-relying habits of the people. Amidst the crush of traffic, and with little time to spare, the formalities of the continental system would be unendurable. Should labelled packages, resigned to the porters and guard, be lost, recourse lies against the company. Another peculiarity of railway traveling in Great Britain consists in the privacy secured to passengers while on their journey. Instead of being intruded on, as in American and continental railways, by the constant perambulation of the guard through the train, they are left unmolested to read, talk, or sleep, according as fancy may direct. This very seclusion, however, is thought to be attended with a disadvantage—namely, that passengers are unable to call for the assistance of the guard in cases of threatened outrage by one of their number.

To all the numerous devices for summoning the guard, and, if need be, stopping the train, there is unfortunately the grave objection; that if passengers were enabled to call the guard at pleasure, they would frequently do so for no sufficient reason, as whim or imaginary fear prompted; and also, that the unexpected stoppage of trains would seriously derange the keeping of time, and in many lines jeopardize the safety of the whole of the passengers. Seemingly, it would be difficult to fall upon any plan free of this species of objection, unless recourse be had to the American construction of carriages, and the free perambulation of the guard through the trains—a remedy which involves a revolution in English railway transit, as well as in English feelings and manners.

To enable companies to reckon easily with each other as regards intercommunication of traffic in passengers, goods, use of carriages, &c., an institution called the Clearing-House has been established in London, to which tickets are transmitted for cross-reckoning and settlement. There is a similar establishment in Dublin. See CLEARING-HOUSE.

Cost of Working.—The cost of working railways, including general expenditure, in Great Britain amounts to from 45 to 50 per cent. of the returns from traffic. The remainder forms the divisible profit to pay—1st, the interest on debentures; and 2d, the dividend to shareholders. Of these shareholders, some, as defined by statute, have a preference claim of 5 per cent. per annum, what is left over being divisible among the ordinary or original shareholders. In the general expenditure of railway companies

is included the outlay for passenger-tax, also police, poor, and parish-rates. Besides supporting the poor, the railways in Scotland are rated like Heritors (q. v.) for building new parish churches.

According to a return made by railway companies to the Board of Trade for 1880, the cost of running trains was on an average 32-37d. per mile, or say about £18, 10s. for 100 miles. Lowness of fares can only be secured by a large and well-sustained traffic; and the main reason why fares are much higher than they seemingly might be, is the frequent insufficiency of the number of passengers compared with the accommodation provided for them. A striking exemplification of the possibility of conveying large numbers at very low fares is afforded in the case of 'excursion trains,' in which sometimes 1000 individuals are taken 50 or more miles and brought back the same day for one or two shillings each.

STATISTICS.—A parliamentary return gives the following statistics for the United Kingdom for 1880: Number of miles open, double lines, 9803; single lines, 8180—total, 17,983. Number of passengers (exclusive of holders of season and periodical tickets), first class, 38,767,926; second class, 65,034,870; third class, 500,082,229—total, 603,885,025. Minerals carried, 165,670,304 tons; general merchandise, 69,635,325. The traffic under all these heads has been more than doubled within ten years. Miles traveled by passenger-trains, 122,548,258; by goods-trains, 115,408,845—total, 240,956,494; equal to near 10,000 times the circumference of the world; or 500 double journeys to the moon, and much more than a double journey to the sun. Receipts from passengers, £23,761,659. Receipts for excess luggage, parcels, carriages, horses, dogs, &c., £2,728,690; receipts for carrying mails, £704,909. Total receipts from passenger-trains, £27,200,464; an increase of fully 64 per cent. in ten years. Receipts for live-stock, £1,170,437; for minerals, £14,679,226; general merchandise, £19,901,741—total of goods-traffic, £35,761,303; an increase of fully 93 per cent. in ten years. Total receipts from all services, £65,491,625. Working expenses, including maintenance of way, locomotive power, repairs and renewals of carriages and wagons, &c., £33,601,124; net balance of receipts over working expenditure, £31,890,501. Proportion of expenditure to receipts, 51 per cent. Vehicles of all sorts employed, 432,466. The traffic receipts per mile of line open amounted to £3511, and per mile traveled by train, to 5s. 2½d. In 1872, the receipts were £3244, 5s. 4½d., and in 1884, £2510, 5s. 6½d. The receipts per train mile were highest in 1866, 5s. 11½d.; and lowest in 1870, 5s. 1½d.

The authorized capital by shares was £596,248,649; by loans, £205,765,355—total £802,014,004. Total paid up on shares and debenture loans, £728,316,848. The proportion of paid-up capital to total length of line open, was £40,613 per mile, the highest proportion yet reached, having risen gradually from 1863, which was the lowest, viz., £32,804 per mile. Of the total capital, about forty-eight millions received no dividend at all; the highest dividend received was 15 per cent.; but the greater part received from 4 to 5 per cent. For the first time since 1858, the returns for 1878 showed a falling off of 0.31 per cent. in traffic; but there was a very marked revival in 1880-81. At the same date, the amount of authorized capital in shares and loans was £778,872,572; of paid-up capital, £698,545,154; the length of single and double lines, 17,333 miles; gross receipts, £60,454,375; per mile of line open, £3488; per train mile, 5s. 5½d. The number of third-class passengers had increased 4 per cent.; while there had been a decrease of first and second.

Accidents.—During the year 1880, the number of railway accidents (collisions, running off lines, breaking of axles, &c.) in the United Kingdom was over 300—Passengers killed, 143; passengers injured, 1613; number of servants of companies, trespassers, &c. killed, 993; injured, 2345—total killed, 1136; injured, 3953. A large proportion of the accidents to passengers were due to causes within the control of the sufferers. The number reported killed in 1878 was 1053, and injured, 4007; the list of casualties in 1876 was considerably larger, including 1245 killed and 4724 injured.

FOREIGN RAILWAYS.—The first continental country that availed itself of railway locomotion was the small kingdom of Belgium, where a number of lines in connection with each other were constructed between 1834 and 1836, and in about ten years afterwards the group was nearly completed in a well-devised and comprehensive scheme. From Belgium railways spread to France, where they were laid down on a plan prescribed by the government, which offered special encouragement to capitalists. The method adopted was to give the land and make the bridges, but besides these heavy items of expenditure, the government was in a number of instances at the cost of the entire permanent way. So far favored, the promoters, who formed a company, had only to find capital to work and maintain the line. The government, however, relinquished the property only on the footing of a lease for such a number of years as a company was disposed to be satisfied with. Tenders were ordinarily taken from competing

bodies of promoters; in this manner the 'concession,' or right of tenancy, has been adjusted at from 50 to 99 years; at the end of the prescribed periods the lines will fall into the hands of the government. Latterly, the French system has outgrown this kind of tutelage; and there is a disposition in companies to act on an independent footing; the state, however, has secured a very general right of property in the existing lines, whether by the method of assistance originally fallen upon, or by giving large subventions of money, on the plan of receiving a share of profits after a certain dividend has been reached. By means of these subventions, as well as a species of guaranteed monopoly of traffic, the profits to shareholders in some French lines reach from 10 to 12 per cent. Within 99 years from 1852, a large proportion of the French railways will lapse into possession of the state. On one or other of the various plans of government helping companies, and preventing ruinous competition, nearly the whole railway system of continental Europe, Asia, and Africa is established; and in a large number of the foreign railway undertakings everywhere much British capital is invested. The principal continental railways, particularly in France and Belgium, are double lines, and under good management; but the rate of transit is generally slower than in England, and the formalities as to taking tickets and being allowed to enter the trains are exceedingly troublesome.

Various continental lines have been constructed by English contractors, who employed English navvies for the purpose. In Italy, however, as lately as 1862, we observed that the work of construction was performed in a tedious and laborious manner by women and girls, who carried the earth in baskets on their heads, under the superintendence of taskmasters with whips—a sorrowful spectacle, and the more surprising as being in a country noted for its advancement in practical engineering.

In Canada, Nova Scotia, and Australia, railways have been successfully established; but in no British dependency has the railway system been latterly pushed forward with such activity or likelihood of advantage as in India, where, at the end of 1874, 6273 miles were open for traffic; and at the beginning of 1881, 9179 miles. The undertakings have been materially assisted by government, by giving the land to the companies, by subventions in proportion to the actual outlay, and in some instances by guarantees of a minimum dividend of five per cent. to shareholders. Railways have likewise been introduced into China and Japan. A line from Shanghai to Woosung, in China, was opened in 1876 (unhappily closed again); and Japan in 1878 possessed 664 miles of railway, with 142 miles in construction, and 455 miles sanctioned by government.

The year 1830 witnessed the introduction of railways into the United States, Massachusetts claiming that proud distinction. To-day, there are close upon 90,000 miles of road, some of these ironways being the most complete and superbly equipped in the world. In fact, as all travellers cheerfully admit, the railway service in the United States excels all other such service elsewhere, while the palace, dining, and sleeping cars are more or less of revelations. The railways in this country are constructed and owned by companies. The cost of procuring legislative authority for a considerable number has been comparatively small, while the land grants given in consideration of construction have, in some cases, been disproportionately large. The longest continuous railway journey in the United States is that from New York City to San Francisco, occupying six days and nights. Save in close proximity to large cities the lines are not fenced, the bell, whistle, and cow-catcher being brought into requisition as occasion may demand. The traveller can journey to the city of Mexico from New York and change cars but once, at El Paso, on the Rio Grande. The average rate of speed used in the United States is 20 miles an hour; but the fastest time on record has been made by a 'flying special' used for delivering a New York daily, 68:2.28 miles having been done in one hour. The 'Chicago Limited,' between New York and that wondrous City of the West, averages 37½ miles an hour the entire trip. Great taste is of late being displayed in the architecture of depots, and in New England especially, the way-station houses are putting those of Old England completely in the shade. The conductors, unlike the guards on European lines, expect no 'tip.' The porters on the sleepers are colored, and as they polish boots, fetch ice water, brush clothes, and perform other such offices, twenty-five cents is usually allotted to them. Ticket offices are established in every city, where tickets can be obtained in advance without the trouble of proceeding to the depot, and baggage can be checked to any part of the continent.

Tramways in city streets, for carriages drawn by horses, were first brought into extensive use in America, and were introduced after opposition into European cities. The first 'elevated railroad' came into operation in New York in 1872. A single track for a train of three carriages, carrying 36 persons each, is borne

on longitudinal wrought-iron girders resting on corbels supported by a single line of wrought-iron posts planted along the edge of the foot-path. The dummy engine moves the train at the rate of 20 miles an hour.

Electric railways, in which a single car is propelled by apparatus depending on electric current, were successfully tried at Paris and at Berlin in 1881; and in the same year a line was laid for an electric tramway from Portrush to the Giants' Causeway. The current in such cases is supplied by a dynamo-electric stationary engine at the end of the track.

There are several weekly newspapers devoted to railway subjects, the oldest of which is *Herapath's Railway Journal*. *Bradshaw's Railway Guide* (q. v.) is well known for its careful time-tables. Other countries have of course their own time-tables.

The following table, taken from an official *Statistical Abstract* and various other sources, shows the mileage of 1855 and 1880 respectively:

States.	Length of Railways open for traffic.	
	1855. Eng. miles.	1880. Eng. miles.
EUROPE.....	21,140	102,781
Austria-Hungary ..	1,758	11,327

Victoria.....	—	1,686
West Australia.....	—	73

The total mileage open over the whole world is now considerably above 220,000 miles.

RAIMONDI, MARC ANTONIO, a celebrated engraver, was born at Bologna in 1487 or 1488. He studied for several years under the celebrated painter Francia, the head of the old Bolognese School. On quitting Francia's studio, he went to Venice, and having seen there, for the first time, prints from the woodcuts after Albert Dürer, he engraved on copper two sets of Prints from that great master's designs, viz., those illustrating the 'Life of the Virgin,' and of the 'Life and Passion of Christ;' to that of the former he attached the cipher or monogram of Albert Dürer, and it is said that the artist complained of the deception to the senate, but only obtained an order that in future the monogram of Albert Dürer should not be copied; at all events, the latter set is without the monogram or mark. From Venice, R. proceeded to Rome, soon attracted the notice of Raphael, and engraved those works after that master that are so highly valued. R. greatly improved his style by imitating the remarkable delicacy and clearness exhibited in the engravings of Albert Dürer and Lucas Van Leyden; and though, perhaps, in these qualities he did not surpass, or perhaps equal, these masters, he went far beyond them in power and purity of drawing, which he carried further than any other engraving; indeed, it has been stated that Raphael himself assisted the engraver in drawing on several of the plates.

After Raphael's death, having engraved some plates after draw-

ings of a licentious kind by Giulio Romano, he was thrown into prison by Clement VII., but was afterwards liberated, taken under the protection of the pope, and fully employed. This prosperous state of matters, however, soon terminated, for on the sack of Rome by the Spaniards under the Constable Bourbon, in 1527, he was plundered of all he had, and was obliged to flee and take refuge in Bologna, where he seems to have lived till the period of his death, the exact date of which is not known, but it must have been after 1539, for a print by him, after Giulio Romano, of the 'Battle of the Lapithæ,' bears that date.

Good impressions of this eminent engraver's works bear, perhaps, a higher value than any other engravings; but there are numerous impressions from his plates to be met with which are of little value, having been thrown off after they had been greatly worn, and repeatedly retouched. The best impressions are without the name of any publisher. After the plates were taken from the stock of Tommaso Barlacchi, they came into the possession of Antonio Salamanca; afterwards, they passed through the hands of Antonio Lafreri, from thence to Nicholas van Aelst, and lastly, became the property of Rossi or De Rubens, and by that time they had been completely worn out. See catalogue of R.'s engravings by Baron Heineken, and Bartsch, vol. 14. Very fine collections are to be seen in the British Museum and the Louvre.

RAIN. At a given temperature, air is capable of containing no more than a certain quantity of aqueous vapor invisibly dissolved through it, and when this amount is present, it is said to be saturated. Air may at any time be brought to a state of saturation by reducing its temperature; and if it be cooled below this point, the whole of the vapor can now no longer be held in suspension, but a part of it, passing from the gaseous to the liquid state, will be deposited in dew, or float about in the form of clouds. If the temperature continues to fall, the vesicles of vapor that compose the cloud will increase in number, and begin to descend by their own weight. The largest of these falling fastest, will unite with the smaller ones they encounter in their descent, and thus drops of rain will be formed whose size and thickness will depend on the thickness and density of the cloud. The point to which the temperature of the air must be reduced in order to cause a portion of its vapor to form cloud or dew, is called the dew-point.

Hence, the law of aqueous precipitation may be stated: Whatever lowers the temperature of the air at any place below the dew-point, is a cause of rain. Various causes may conspire to effect this object, but it is chiefly brought about by the ascent of the air into the higher regions of the atmosphere, by which, being subjected to less pressure, it expands, and in doing so, its temperature falls. Ascending currents are caused by the heating of the earth's surface, for then the superincumbent air is also heated and consequently ascends by its levity. Air-currents are forced up into the higher parts of the atmosphere by colder, drier, and therefore heavier wind-currents getting beneath them, and thus wedgeways thrusting them upwards; and the same result is accomplished by ranges of mountains opposing their masses to the onward horizontal course of the winds, so that the air, being forced up their slopes, is cooled, and its vapor liberated in showers of rain or snow. Again, the temperature of the air is lowered, and the amount of the rainfall increased, by those winds which convey the air to higher latitudes. This occurs chiefly in temperate regions, or in those tracts traversed by the *return trade-winds*, which in the north temperate blow from the south-west, and in the south temperate zone, from the north-west. The meeting and mixing of winds at different temperatures is also known to produce rain, but not nearly to the extent at one time believed: It is also increased or diminished according as the prevailing winds arrive immediately from the sea, and are therefore moist, or have previously passed over large tracts of land, and particularly mountain ranges, and are therefore dry. Since the rainfall is evidently much modified by the temperature of the earth's surface over which the rain-producing winds blow, it follows that sandy deserts, by allowing solar and nocturnal radiation to take immediate effect in raising or depressing the temperature, and forests, by delaying, if not, in many cases, counteracting these effects of radiation, have each a peculiar influence on the rainfall.

Rain is the most capricious of all the meteorological phenomena, both as regards its frequency and the amount which falls in a given time. It rarely or never falls in certain places, which are, on this account, designated the rainless regions of the globe—the coast of Peru, in South America; the great valley of the rivers Columbia and Colorado, in North America; Sahara, in Africa; and the Desert of Cobi, in Asia, are examples, whilst on the other hand, in such regions as Patagonia, it rains almost every day. Again, the quantities which have been recorded at some places to have fallen at one time, are truly enormous. In Great Britain, if an inch fall in a day, it is considered a very heavy rain. In many parts of the Highlands of Scotland, three inches not unfrequently fall in one day. On the 5th of December 1863,

there fell at Portree, in Skye, 12½ inches in 18 hours; and on the same day, 5·2 inches fell at Drishraig, near Loch Awe, where also, two days afterwards, 7·12 inches fell in 30 hours. At Seathwaite, in Borrowdale, 6·62 inches fell on November 27, 1845. But it is in continental, and especially tropical countries, where the heaviest single showers have been recorded. The following are a few of the most remarkable: At Joyeuse, in France, 31·17 inches fell in 22 hours; at Geneva, 80 inches in 24 hours; at Gibraltar, 33 inches in 26 hours; on the hills above Bombay 24 inches in one night; and on the Khasia Hills, 80 inches on each of five successive days.

In all places within the tropics where the trade-winds are blowing regularly and steadily, rain is of rare occurrence, the reason being, that as these winds come from higher latitudes, their temperature is increasing; and hence they are in the condition of taking up moisture rather than of parting with it; and the return trade-winds, which blow above them in an opposite direction, having discharged the greater part of their moisture in the region of the calms, are also dry and cloudless. Where, however, these winds are forced up mountain-ranges in their course, as on the east of Hindustan, they bring rain, which falls chiefly during night, when the earth's surface is coolest.

The region of calms is a broad intertropical belt about 5° in breadth, characterized by calms, and towards which the northern and southern trades (see **TRADE-WINDS**) blow. This, the region of calms, is at the same time the region of constant rains. Here the sun almost invariably rises in a clear sky; but about mid-day, clouds begin to gather; and in a short time, the whole face of the sky is covered with dense black clouds, which pour down prodigious quantities of rain. Towards evening, the clouds disappear, the sun sets in a clear sky, and the nights are serene and fine. The reason of this daily succession of phenomena in the belt of calms is, that there the air, being heated to a high degree by the vertical rays of the sun, ascends, drawing with it the whole mass of vapor which the trade-winds have brought with them, and which has been largely added to by the rapid evaporation from the belt of calms; this vapor is condensed as it is raised towards the line of junction of the lower and upper trade-winds, and the discharge is in some cases so copious, that fresh water has been collected from the surface of the sea. As evening sets in, the surface of the earth and the superincumbent air are cooled, the ascending currents cease, the cooled air descends, and the dew-point is consequently lowered, clouds are dissipated, and the sky continues clear till the returning heat of the following day brings round a recurrence of the same phenomena. Since the belt of calms, which determines the rainy season within the tropics, moves northward or southward with the sun's declination, carrying the trade-winds with it on each side, it follows that there will be only one rainy and one dry season in the year at its extreme northern and southern limits; but at all intermediate places, there will be two rainy and two dry seasons, at the equator these will be equally distant from each other.

This state of things is only of strict application to the Pacific Ocean, whose vast expanse of water, presenting a uniformly radiating and absorbing surface, is sufficient to allow the law to take full effect. But over the greater part of the earth's surface disturbing influences draw the trade-winds more or less out of their normal course, and sometimes produce a total reversal, as in the case of the Monsoons (q. v.). These winds determine entirely the rainfall of India, and but for them, the eastern districts of Hindustan would be constantly deluged with rain, and the western parts constantly dry and arid. As it is, each part of South Asia has its dry and wet season, summer being the wet season of the western parts and interior as far as the Himalaya, and winter the wet season of the eastern, and especially south-eastern parts.

The heaviest annual rainfall on the globe is 527 inches, at Cherro Punji, on the Khasia Hills, 494 inches of which falls from April to September during the S.W. monsoon. The astonishing amount is due to the abruptness of the mountains which face the Bay of Bengal, from which they are separated by 200 miles of low swamps and marshes. The winds not only arrive among the hills heavily charged with the vapor they have absorbed from the wide expanse of the Indian Ocean, but being near the point of saturation, their temperature not being raised in passing over these swamps, they are, so to speak, ready to burst in torrents over the abrupt cliffs which divert them from their horizontal course into the higher regions of the atmosphere.

At 20 miles inland, the annual fall is reduced to 200 inches; 80 miles further south, it is only 100 inches; north, at Gowliatty in Assam, it is only 69 inches. In the north-west of the Bay of Bengal, at Cuttack, it is only 52 inches; while in the north-east, in Arracan, owing to the S.W. direction of the winds, it is from 200 to 240 inches. At Madras, the annual fall is 48 inches; at Seringapatam, only 24 inches; at Bombay, 71 inches; at Utrammully, 263 inches, and at Mahabalishwar, 254 inches, both on the Western Ghauts; and at Poona inland, 27 inches. The

south-west monsoon discharges from 50 to 90 inches of rain over the parts of Hindustan not bounded by high mountains to the west, before reaching the Himalayas, after which it discharges the greater part of its moisture, 120 to 140 inches, on the outer Himalayan range, at elevations of 4000 to 8000 feet. Thus, four times more rain falls annually on the Khasia Hills than on the Himalaya, owing to the less abrupt face these latter mountains present to the south, to the sandy burning plain, which raises the winds considerably above the dew-point, and to the larger tract traversed by the winds, over which their moisture continues to be discharged as they pass.

The following are a few of the annual rainfalls in the tropics; Singapore, 97 inches; Canton, 78 inches; St. Benoit (Isle of Bourbon), 163 inches; Sierra Leone, 126 inches; Caracas, 155 inches; Pernambuco, 106 inches; Rio Janeiro, 45 inches; Georgetown, 95 inches; Barbadoes, 50 inches; St. Domingo, 107 inches; Bahamas, 55 inches; and Vera Cruz, 188 inches. In many places in the interior of continents within the tropics, the rainfall is small—not greater, in fact, than in temperate countries, such as the eastern parts of England. At Poona, only 23 inches fall annually.

The periodicity of the rainfall disappears as we recede from the tropics, and the times of the year during which it occurs are different—the greater quantity falling in summer at places within the tropics and in the interior of continents, but in winter in countries bordering on the sea in temperate regions. In respect of the rainfall, Europe may be divided into two distinct regions: Western Europe, and the countries bordering on the Mediterranean. A vast ocean on the one hand, a great continent on the other, and a predominance of west winds, are the determining circumstances in the distribution of the rainfall over Western Europe. As the south-west winds, which are the return trades, descend to the earth and blow over the surface of Europe, and as the whole of this continent is thus within their influence, it follows that the western parts, especially where mountain-ranges stretch north and south, are rainy districts; for these mountains, diverting the south-west winds from their horizontal course, force them up into the higher regions of the atmosphere, where, chilled, they form into clouds, or deposit in rain the vapor they can no longer hold in suspension. Hence, the rainiest regions of Europe are Norway, Ireland, the west of Great Britain and of France, Spain, and Portugal. At the Styx, in the Lake District, 88.9 inches fell in January in 1851; at Drishaga, 83.2 inches, and at Portree, 82.4 in December 1863; and in the same month, from 23 to 30 inches at many other places in the Scottish Highlands. In the west of Great Britain and Ireland, in the vicinity of high hills, the average rainfall is from 80 to 128 inches. At Bergen, in Norway, it is 70 inches; in the Peninsula, at Oporto, it is 54 inches; at Bilbao, 47 inches; and at St. Jago, 65 inches; and in France, it is 51 inches at Nantes, and 49 at Bayonne.

At places at some distance from hills, and in more inland districts, the annual fall is much diminished. Thus, in the west of Great Britain, away from hills, it is from 30 to 45 inches; while in the east, it is from 20 to 28 inches. In France, it averages 30 inches; and in the plains of Germany and Russia, 20 inches; while in some parts of Sweden and Russia, it falls as low as 14 inches. In the interior of Europe, in mountainous districts, it rises much above these amounts; thus, at Ischl, it is 62 inches. An important distinction between the mode of distribution of the rainfall in the west of Europe and that of more inland places is, that the greater part of the annual amount in the west falls in winter; but in the interior, in spring or summer. This difference is particularly striking on the different sides of Great Britain, and arises from this circumstance, that as the clouds are much lower in winter, they are arrested and drained of their moisture by the less elevated hills, leaving little to be deposited eastwards; but in summer, being high, they pass above, and discharge themselves in the interior. Thus, for every 10 inches of rain which fall at the following places in winter, there fall in summer respectively 84 inches in the west of Great Britain, 11 inches in the east of Great Britain and west of France, 15 inches in the east of France, 20 inches in Germany, and 27 inches in the north and east of Russia.

The peculiarity of the rainfall of the basin of the Mediterranean depends on its proximity to the burning sands of Africa, a predominance of northerly winds, and the position of the Pyrenees and Spanish sierras to the west, on which the south-west winds discharge their rains before arriving on the north shores of the Mediterranean. In the valley of the Rhone, four times more rain falls in autumn than in summer; and south of the Alps, six times more rain falls with the north-east than with the south-west winds being the reverse of what takes place in England. In Italy, the quantity diminishes as we approach the south. On the coasts of the Mediterranean, it rarely rains in summer, but frequently in winter. In the valley of the Rhone, the annual fall ranges from 20 inches at its mouth to 63 inches at St. Rambert, the average being 30 inches. This is also the average of the valley of the

Po; but on ascending to the Alps, it rises, as at Tolmezzo, to 96 inches.

The rainfall in the west of the American continent is distributed similarly to that of Europe—the amount being dependent on the physical configuration of the surface over which the westerly winds blow. The yearly amount increases as we proceed northward; thus, at San Francisco it is 21 inches; at Fort Reading, 29 inches; at Fort Oxford, 72 inches; at Fort Vancouver, 47 inches; at Astoria, 86 inches; at Seallacom (Wash. Ter.), 54 inches; and at Sitka, in Alaska, 82 inches.

But in the United States, the manner of the distribution of the rain is very different from that of Europe. The United States are dependent for their rain not on the Pacific Ocean, but on the Gulf of Mexico. There can be little doubt that, but for the high range of the Rocky Mountains in Central America, the greater part of the States would be an arid waste. These mountains are so high as to present an effectual barrier to the passage of the trade-winds, which blow over the Gulf of Mexico; they are, on this account, turned northward, and spread themselves over the States, especially over the low basin of the Mississippi. These winds being characterized by great heat, and loaded with much moisture from the warm waters of the Gulf of Mexico, tend to disturb the statical equilibrium of the atmosphere. When they have blown for some time, vast accumulations of heat and moisture take place, the equilibrium is destroyed, a great storm arises in consequence, sweeping eastward over the States, and in many cases crossing the Atlantic, and descending with violence on Western Europe. In the States, the southerly winds preceding the storm give place to the dry north-west winds, which rapidly clear the sky, and bring brilliant bracing weather in their train.

It appears, in short, that the south winds from the Gulf of Mexico spread the moisture over the State, and the north-west wind disengages this moisture from them by getting below them, by their greater density, and thrusting them into the higher regions of the atmosphere. If this be the case, as the phenomena seem to warrant, then the heaviest rainfalls will be in the valleys, and the least on the higher grounds—a mode of distribution quite different from what prevails in Europe. And such is really the case, for the greatest amount of rain falls in Florida, the low flats of the Mississippi, then along its valley, and lastly in Iowa, or in that remarkable depression at the head of the river; and the least quantities on the Alleghanies, especially on their higher parts, and on the high grounds of the Missouri district. The following figures, giving the average annual amount in inches, show this in a clear light: Pensacola, 57; Fort Brooke, 55; and Fort Pierce, 63—in Florida; Monroeville, 66; and Mobile, 64—in Alabama; Natchez, 58; Jackson, 53—in Mississippi; Rapides, 68; New Orleans, 52—in Louisiana; Savannah, 48—in Georgia; Nashville, 55—in Tennessee; Dubuque, 33—in Iowa. At Athens, in Georgia, south of the Alleghanies, the amount is 36 inches; at Alexandria, in Virginia, also 36 inches; and at Jefferson, in Missouri, 38 inches. In the Northern States, the quantity diminishes at most places to between 27 and 45 inches, and the mode of its distribution becomes assimilated to that of Europe.

When raindrops fall through a stratum of air below 32°, they become frozen, and form *Hail* (q. v.). When the vesicles are formed in air under 32°, *Snow* (q. v.) is the result.

RAINBOW. The ordinary phenomena of the rainbow are usually visible on every occurrence of a 'sunny shower,' and we need not describe them particularly until we deduce them, one after another, from their cause. The most careless observation shows us that, for the production of a rainbow, we must have a luminous body of moderate angular diameter, and *drops* of water; for it is never seen except by direct sun or moon light, and never in a cloud unless rain be falling from it. Now, a falling drop of water takes, by its molecular forces, a *spherical* form. Also, as there is separation of the various colors of which white light is composed, the cause of the phenomenon must involve *Refraction* of Light (q. v.), because by *Reflection* (q. v.) these colors are not separated. But, again, the spectator who views the rainbow has his back to the sun, and rays of light merely refracted by a rain-drop could not be thus sent back to the spectator. The phenomenon must therefore depend upon successive reflections and refractions, and we shall investigate in an elementary manner what appearances we ought to expect as the result of such processes according to the known laws of optics; merely premising that the fundamental points of the explanation were first given by Newton in the second book of his *Optics*.

First, then, let us consider what becomes of parallel rays of light, of *one color* or refractive index (see **REFRACTION**), which are successively refracted and reflected in a single spherical rain-drop.

For our immediate purpose, it is sufficient to suppose that the refractive index (see **REFRACTION**) of water is $\frac{4}{3}$; that is, the incident and refracted rays make with the perpendicular to the refracting surface of water, angles whose sines are in the ratio of 4 to 3.

Let the circle represent a section of the drop made by *any* plane passing through its center O , and the line SO , which joins its center with the sun; the sun being supposed, for the moment, to be a single luminous point, situated at so great a distance that lines drawn to it from different points of the drop are parallel. A ray of light, SB , falling on the drop in the plane of section

Fig. 1.

will be, of course, partly reflected and partly refracted at B . The reflected part does not concern us, as in it all colors would travel together; and, in fact, the result of reflection from external surfaces of the drops is simply to illuminate the background feebly. Join OB , and produce it to Q . Then the refracted ray (see REFRACTION) will have in the drop the direction BA , where the ratio of the sines of SBQ and OBA is the refractive index of water—i. e., $4:3$ nearly. Arriving at A , the ray will be partly refracted in some such direction as AD , and the rest reflected in the direction AC . Now AD obviously cannot fall on the eye of a spectator whose back is turned to the sun, and it has, therefore, nothing to do with the rainbow. The internally reflected ray, AC , on reaching the surface at C , is partly refracted in the direction CT (where BS and CT are symmetrically situated on opposite sides of OA), and partly reflected internally. The latter portion we must consider when we come to the cause of the secondary, or outer rainbow, the former is that which at present concerns us. Let SB_1, SB_2 be other incident rays. After a refraction, a reflection, and a second refraction, they emerge in the directions C_1T_1, C_2T_2 , respectively. From the figure, which is drawn from calculation, it is obvious that both C_1T_1 and C_2T_2 are less inclined to OS than CT is. Hence for rays parallel to SO , falling on the drop, and emerging after suffering two refractions and a reflection, the final direction is more and more inclined to SO , as the point of incidence, B , is further from P , at least up to some such point as B ; after which (for points situated at B_2) it diminishes again. By proper mathematical methods, it is easy to find that the angle SOB is about $59^\circ 24'$, if the refractive index be $\frac{4}{3}$. Now, by a general property of maxima or minima in optics (see CAUSTIC), the rays falling on the drop near to B will emerge nearly parallel to CT ; while those incident near any other point (as B_2) will be widely scattered at emergence. And we may evidently extend this reasoning to all other rays by supposing the above figure to rotate about the axis SO .

The conclusion is, therefore, that if homogeneous light fall in parallel lines on the spherical drop, those rays which have been twice refracted at the surface, and once internally reflected, will, on emergence, all lie within the cone formed by the revolution of CT about SO , and will be condensed towards the surface of that cone. Hence such an illuminated drop gives off by this particular process a solid cone of rays, much condensed towards its external boundaries.

So much for each drop. Next let us inquire what the appearance will be to an eye in any given position. Referring to the next figure, in which the letters are the same as in the former, draw TS' parallel to SO . Then TS' is the direction of the line drawn to the point on the heavens diametrically opposite to the sun. So are $E_1S'_1$ and $E_2S'_2$, drawn from any assumed positions, E_1 and E_2 , of the spectator's eye.

If the eye be placed in the surface of the cone just described, as at T , it will receive the condensed ray which emerges in the direction CT ; if at E_1 (within the cone), it will receive diffused rays from the drop; if at E_2 (outside the cone), it will receive no light at all.

To put this in a simpler form: Draw E_1F_1 and E_2F_2 parallel to TC ; then we may evidently say that the eye receives a condensed light from any drop whose angular distance from the point oppo-

site the sun is CTS' , a diffused light if the angular distance be less than this, and none at all if it be greater. By methods al-

Fig. 2.

ready alluded to, it is found that CTS' is nearly $42^\circ 12'$ for the index of refraction $\frac{4}{3}$.

Hence, if the sun were a luminous point, emitting homogeneous light, whose index of refraction in water is $\frac{4}{3}$, a spectator looking through a shower of falling raindrops towards the point immediately opposite to the sun, would see a bright circle of angular diameter $84^\circ 24'$ surrounding this point, diffused light within that circle, and darkness without it.

The effect of the finite angular diameter of the sun is evidently to widen this circle into a circular luminous band, whose breadth is the sun's apparent diameter, and whose mean radius is $42^\circ 12'$.

Next, let us consider the different refrangibilities of the colored constituents of white light. The investigation above hinted at shows that the radius of the luminous circular band is greater, the less the refractive index; the proof, though very simple, would be out of place in this work. Hence the appearance actually observed with sunlight will be formed by the superposition of concentric, overlapping, circular bands, the radii being less and less as we consider the primary colors in the order from red to violet (see SPECTRUM). That is, we shall have a circular illuminated space, brightest towards the edge, with a homogeneous red ring as its external boundary, and a gradual mixture of the prismatic colors as we look nearer to the center. This agrees very well with observation, and so do the calculated diameters of the external red ($42^\circ 22'$) and internal violet ($40^\circ 35'$) rings.

But what becomes of the light twice, reflected inside the drop, and then refracted out? Let. fig. 3 represent again a section of

Fig. 3.

the drop, with sunlight falling on it in lines parallel to SO , and let us trace the course of one ray, as SB . The part reflected at B is to be disposed of as before; it goes merely to illuminate feebly, the otherwise dark background of cloud and vapor. The refracted portion proceeds, as before, to A , where part is reflected internally along AC , and part refracted out. The latter portion, as we have already seen, cannot possibly reach the eye of a spectator whose back is turned to the sun. Similarly, at C , there is internal reflection along CD , and refraction out of the drop. The refracted part has already been considered, as the cause of the primary rainbow. The reflected part will again at D , be separated into two; one reflected internally, which proceeds to form the tertiary and higher orders of bow; and the other, escaping from the drop in the line DT , which goes to form the secondary bow. This we will consider with some care,

because the secondary bow, though necessarily fainter than the primary, is usually seen; the tertiary and higher bows, each much fainter than the preceding one, since the beam inside the drop is weakened at each succeeding reflection, require no notice, as even the tertiary has never been observed in nature.

As before, we have traced the courses of two other beams, SB_1 and SB_2 , in their passage to form part of the secondary bow. They are respectively $SB_1A_1C_1D_1T_1$ and $SB_2A_2C_2D_2T_2$; and the figure shows us that the final rays D_1T_1 and D_2T_2 are each more inclined to SO than DT is. There is, therefore, a particular ray, SB , whose final direction, DT , is less inclined to SO than that of any other ray which has suffered two refractions and two internal reflections; and, as before, the emergent light is condensed towards this minimum. If then, the figure be made to revolve about SO , we see that DT will describe a cone, that *inside* this cone there is no refracted light, that towards the surface of the cone, part of the light is condensed, and that the rest of it is diffused through *exterior* space.

So much for one drop; let us now, as before, consider what will be seen by an eye in any position with regard to this particular drop. In fig. 4, the letters denote the same things as in fig. 3. Hence, if the eye be placed at T , it will receive the maximum of light, in a direction making an angle DTS' with the point in the heavens opposite to the sun. If at E_1 , it will receive some of the diffused light from a drop whose angular distance from the point opposite the sun is *greater* than DTS' ; and if at E , it will receive no light at all, the drop's angular distance from the point opposite the sun being *less* than DTS' . Hence the appearance presented by a shower of drops is, for homogeneous light coming in parallel lines, a bright circle, whose angular radius is DTS' ;

Fig. 4.

diffused light outside that circle, and no light within it. When the light comes from a source of finite angular diameter, as the sun, the only effect is, as in the primary bow, to *widen* the bright circular band. When we consider the various components of white light, calculation shows us that DTS' is least for red, and greatest for violet. Hence we have a series of concentric colored bands superposed, their diameters increasing from the red to the violet. Hence the secondary rainbow has its inner edge red, and its outer violet; the intermediate space being an exceedingly mixed, or impure Spectrum (q. v.). The results of geometrical optics show us that the angular diameter of the red is $100^\circ 48'$, and of the violet $106^\circ 44'$; so that the breadth of the bow is $3^\circ 30'$ nearly.

In nature, these rough results are pretty closely verified; but a more profound investigation into the circumstances of the problem shows us some modifications. In the first place, we find that for each kind of homogeneous light the actual maximum of brightness is in a circle of rather less angular diameter than that given by the more elementary investigation for the primary bow; and rather greater for the secondary. Secondly, and still with homogeneous light, there is a succession of feebler and feebler concentric circles of maximum brightness—inside the principal maximum in the primary bow, and outside it in the secondary. These give rise to what is always seen in a fine rainbow, the so-called *spurious* or *supernumerary* bows, lying close inside the violet of the primary bow, and outside that of the secondary. These are fainter and more impure as they proceed from the principal bow, and finally merge into the diffused white light inside the primary bow, and outside the secondary.

The angular dimensions of these bows, principal and spurious, were calculated from theory by Airy, and carefully measured by Miller in the artificial bow formed by passing light through a very

fine column of water descending through a small aperture, and the accordance was perfect.

The lunar rainbow, which is a comparatively rare, but very beautiful phenomenon, differs from the solar simply in the source and intensity of the light by which it is produced; and, as in all cases of feeble light, the distinction of the colors is very difficult. In fact, except under the most favorable circumstances, the lunar rainbow rarely shows colors at all, giving a pale ghostly gleam of apparently white or yellow light.

RAIN-GAUGE. The use of rain-gauges is to ascertain the amount of rain which falls at any given place. They are of various constructions. The simplest is that which consists of a metallic cylinder, from the bottom of which, a glass tube (*bc*), divided into inches and parts of an inch, projects downwards. It is provided with a funnel, inserted within at the top, to prevent evaporation, and the rain-water is emptied out by means of a stop-cock (*d*) at the bottom, or, still simpler, by a hole (*a*) pierced in the funnel at the top. (See accompanying wood-cut.) As this

form of gauge is objectionable on account of the frequent breakage of the glass-tube by frost, a float is used instead, which is raised by the water, and a scale is attached to it, to show the quantity of rain received. As this gauge does not admit of very nice readings, another sort is frequently employed, viz., a receiving-vessel and a glass measure of much smaller diameter, which thus admits of as nice graduation as may be desired. As, practically, there is often great difficulty or trouble experienced in replacing the glass measure when it chances to get broken, the late G. V. Jagga Rao, a wealthy zemindar of Vizagapatam, proposed a gauge in the form of a funnel having a diameter of 4.697 inches, or an area of 17.33 square inches. Now, as a fluid ounce contains 1.733 cubic inches, it follows that for every fluid ounce collected by this gauge, the tenth of an inch of rain has fallen. This measure can, of course, be graduated to any degree of nicety, and may be reproduced at pleasure. It has also the great merit of being by far the cheapest gauge, costing only 4s. 6d. Self-registering rain-gauges have been invented by Osler, Crosley, and Beckly, but they are too expensive to come into common use.

A most important point with regard to the rain-gauge is its height above the ground. Professor Phillips found the fall of rain at York for twelve months in 1833—1834, to be 14.96 inches at a height of 213 feet from the ground; 19.85 inches at 44 feet; and 25.71 inches on the ground. This remarkable fact—viz., that different quantities are collected at different heights, the amount being always greater at the lower level, has been confirmed wherever the experiment has been made. No perfectly satisfactory account has yet been given of this singular phenomenon. The condensing of the vapor of the atmosphere on the surface of rain-drops as they fall—the rebound of the finer particles into which many of the drops break themselves as they strike with violence on the ground—and the eddies and currents which prevail most and strongest around isolated objects raised above the surface of the ground, to a large extent account for the phenomenon. Of these three, the greatest weight is to be given to the last two; and this is confirmed by the fact, that a gauge placed on the roof of a building that happens to be flat, of considerable area, and with few or no chimney-stalks to disturb the air-currents, collects an amount equal to that collected at the same place by a gauge on the ground. The proper size and shape of the rain-gauge, and its height above the ground, so as to measure with the greatest exactness possible the real quantity of rain that falls are still debated. There are pluviometers or rain-gauges that indicate the duration of rainfall, by marking the rain-drops on a chemically sensitized plate; and there is a 'self-registering' R., which, by means of a float, rod, and spring pencil or pointer, marks the duration and quantity of rainfall by tracing a line on a revolving drum with diagram sheet.

RAIN-PRINTS, in Geology. See **ICHOLOGY**.

RAINY LAKE forms a portion of the boundary-line between British North America and the United States. It is situated 160 miles west of Lake Superior, is 1160 feet above sea-level, and is about 35 miles long, and 5 miles in average breadth. Its surplus waters are carried off to the Lake of the Woods, in a west-north-west direction, by the Rainy River, which is about 100 miles in length, and the banks of which are covered with pine-forests.

RAISED SEA-BEACHES. See **BEACHES, RAISED**.

RAISINÉE, a *rob*, or sweetmeat, much esteemed in France, made by boiling new wine, and skimming until only half the quantity of wine remains; after which it is strained; apples, pared and cut into quarters, are added to it, and it is allowed to simmer gently, till the apples are thoroughly mixed with the wine, when it has a very pleasant sweetish acid taste. Cider may be used instead of wine.

RAISINS are dried grapes, prepared by two different methods. The one method consists in partially cutting through the stalk of the ripened bunches, and allowing them to shrink and dry upon the vine by the heat of the sun. These are by far the better sort, and are called *Raisins of the Sun*, or Muscatels. Malaga is much celebrated for its sun-raisins, which are the finest in the world. The raisins prepared by the other method are called *Lenias*, and are gathered and hung on lines, or laid on prepared floors to dry in the sun. When dried, they are dipped in a hot *lye*, made by dissolving the alkali out of wood-ashes or barilla with water, until the filtered fluid has a specific gravity of about 1.100; to this is added, for every four gallons, a pint of olive oil and a quarter of a pound of salt. After dipping, the fruit is laid on hurdles of wicker-work to drain, and is continually exposed to the sun for about a fortnight. The raisins are then pulled from the stalks, and packed into boxes for transport to other countries. The qualities best known in the markets are Valencias and Denias from Spain, Malagas from Malaga, and black Smyrnas and Sultanas from Asiatic Turkey. The ravages of the *phylloxera* in France have led to an immense importation of raisins from the East to Marseilles chiefly, for the manufacture of wine (see **WINE**). The Currant (q. v.) is only a small variety of grape. In 1880, Britain imported 995,290 cwt. of raisins, and currants to the amount of 820,146 cwt.

RAJAH, or more correctly **RAJA** (from the Sanscrit *rajan*, king, cognate with the Latin *rex* or *rex*), is originally a title which belonged to those princes of Hindu race who, either as independent sovereigns or as feudatories, governed a territory; it then, however, became a title given by the native governments, and, in later times, by the British government to Hindus of rank, and it is now not uncommonly assumed by the zemindars or land-holders; the title Maharajah, or 'great Rajah,' being, in these days, generally reserved to the more or less independent native princes. According to the ancient social system of India, the rajah belonged to the kshatriya or military caste (see **CASTE**); now, however, the title is given to, and assumed by, members also of an inferior caste.

RAJAMAHE'NDRI, or **RAJAMUNDRI**, a town of Hindustan, capital of the district of Godavari, in the presidency of Madras, stands on the left bank of the Godavari, about 50 miles from the mouth of that river, and in long. 81° 53' E. To the north of the town is the Fort, a square edifice, comprising the barracks, hospital, jail, and magazine. The nobler kinds of game, as well as wild-fowl of all sorts, abound in the vicinity, and the situation and scenery are in the highest degree beautiful. The Godavari is here about two miles wide, and is crossed by a steam-ferry. Carpens and table-cloths are manufactured. Pop. 19,738, about a fourth of whom are Brahmans. The collectorate of Godavari, of which R. is the capital, has an area of 6224 square miles, and a pop. (1871) of 1,592,939.

RAJATARANGIN'I (or 'the river of kings,' from the Sanscrit *rajan*, king, and *tarangin'i*, a river or stream) is the name of four chronicles of the history of Cashmir written in Sanscrit verse; the first by *Kalhan'a*, bringing the history of Cashmir till about 1148 after Christ; the second, a continuation of the former, by *Jonarāja*, to 1412; the third, a continuation of the second, by *S'rihara*, a pupil of Jonarāja, to 1477; and the fourth by *Prāgyabhat't'a*, from that date to the conquest of the valley by the Emperor Akber. Amongst these chronicles, however, it is especially the first which has earned a great reputation, inasmuch as it is the most important and the completest of all known Hindu chronicles, and, for this reason, may be considered as the only surviving work of Sanscrit literature which betrays an attempt at historiography. The author of the work, the Pandit *Kalhan'a*—of whom we merely know that he was the son of Champaka, and lived about 1150, under the reign of Sindhadeva of Cashmir—reports that before entering on his task, he had studied eleven historical works written previously to his time, and also a history of Cashmir by the sage *Nila*, which seems to be the oldest of all;

but that, not yet contented with these sources of information alone, he had also examined old documents, such as grants and proclamations made by kings, texts of laws, and sacred books. It may be presumed, therefore, that *Kalhan'a* had not merely the desire, but set honestly to work to elucidate the history of Cashmir up to his date. And so far as the last few centuries preceding him are concerned, it is possible that the facts narrated by him are reliable; but owing to the uncritical disposition of the Hindu mind in all matters that regard historical facts, those especially of a more or less religious or legendary character, and also to his bias to produce a consistent system of chronology, great doubts must attach to all that relates in his work to the ancient history of India. In spite of these shortcomings, however, which are more those of the nation to which the author belonged, than those of the individual himself, much that is reported by *Kalhan'a* is the only source of information we have of the history of Cashmir, and much very valuable as coming from an indigenous source.

Kalhan'a begins his work, as may be expected, with the mythological history of the country; the first king named by him is Gonoroda, who, according to his chronology, would have reigned in the year 2448 before Christ; and the last mentioned by him is Sindhadeva, about 1150 after Christ. The Sanscrit text of the complete work, together with that of the three other *Rajatarangin'i*s, which is of little extent, has been edited at Calcutta in 1835, under the auspices of the General Committee of Public Instruction and the Asiatic Society of Bengal. Six sections of it have been edited, with notes, and learned appendixes, in French, by A. Troyer, who likewise translated into French these sections, as well as the remaining two (*Rajatarangin'i, Histoire des Rois du Cachmir*, &c., vols. 1—3, Paris, 1840—1852).—See also H. H. Wilson, *An Essay on the Hindu History of Cashmir*, in the *Asiatic Researches*, vol. xv., and Lassen's *Indische Alterthumskunde*, vols. i. and ii.

RAJMAHA'L, a town of India, in the district of Bhagulpore, Bahar, Lower Provinces of Bengal, and a station on the line of railway from Calcutta to the north-west frontier, stands on a steep eminence on the right bank of the Ganges, 200 miles by land north-north-west of Calcutta. Its position is advantageous, and it was long the chief town of the Bengal and Bahar provinces. Since the removal of the British courts of justice, however, its prosperity has declined. It now presents a deserted and ruinous appearance, but is still noteworthy for the remains of its once splendid palace, and for its important transit-trade. It contains twelve market places, and has about 30,000 inhabitants, most of whom are employed in providing for the wants of the vast number of travelers who pass through the town by land and water.

RAJPOOTS, or **RAJPUTS** (from the Sanscrit *rajan*, king, and *putra*, son; hence literally, 'sons of kings'), is the name of various tribes in India which are of Aryan origin, and either descended from the old royal races of the Hindus, or from their Kshatriya or warrior caste (see **CASTE**). At all periods, they seem to have played a conspicuous part in the history of India; and all over Hindustan there are many families who, rightly or wrongly, claimed the title of Rajputs. At present, they occupy chiefly the country known as Rajasthan or Rajputana, including, amongst other states, those of Mewar, Marwar, Jeypur, Bikanir, Jessulmir, Kotah, and Bundi. Before the invasion of Mahmud the Ghiznevide, four great kingdoms were under the dominion of Rajput families—viz., Delhi, Kanauj, Mewar, and Anhilwarra; and all the kings mentioned in the *Rajatarangin'i* (q. v.) of *Kalhan'a* were of Rajput origin.—For the history, &c., of the R., and the geography of Rajputana, see Colonel James Tod's *Annals and Antiquities of Rajasthan*, or the *Central and Western Rajpoot States in India* (2 vols., Lond. 1829); Ritter's *Erskunde*, vol. vi. pp. 724, ff.; Lassen's *Indische Alterthumskunde*, vols. i. and ii. (*passim*); A. Troyer's *Rajatarangin'i*, vol. iii. (*Eclaircissements historiques*, &c.).

RAKE, an agricultural and horticultural implement, in use from very ancient times. In its simplest form it consists merely of a bar of wood or iron, with wooden or iron teeth inserted into it, and attached at right angles across the end of a long handle. It is used for collecting straws, &c., from a field after it has been reaped or mown, or stones from newly-tilled ground, sometimes also in gardens, for covering seeds. A long rake, with a short triangular framework instead of a handle, and curved teeth, is much used in hayfields in England, and is known as the *ell-rake*. Rakes are also adapted for being drawn by horses; and there are many modifications both of the hand-rake and the horse-rake.

RAKE, in Naval Language, has more than one meaning. The rake of a ship's stern or bow is the length to which the keel would have to be prolonged to bring it under the most projecting point of the stern or bow. Raking masts are masts set alope, so that the angle they make with the keel towards the stern is less than a right angle, as in a brigantine. To rake a ship is to bring guns to bear so as to fire them along her deck from end to end: this is

the most disastrous thing that can happen to a vessel in action, and it is the object of all good seamanship to avoid it. When a ship is raked at short range, grape can be used with great and fatal effect.

RAKING MOULDING, a moulding not horizontal or vertical, but sloping at an angle. When joined to a horizontal moulding, the raking moulding is run so as to mitre with the true vertical profile of the former, and is therefore different from it in section.

RAKO'CZYMARSC, a simple but grand military air by an unknown composer, said to have been the favorite march of Francis Rako'czy II. of Transylvania, and at all events much played in his army. The Magyar Hungarians adopted it as their national march, and in 1848 and 1849, it has been alleged to have had the same inspiring effect on the revolutionary troops of Hungary as the *Marseillaise* on the French. Like the *Marseillaise* in France, it has been placed under the ban of the Austrian government at various periods of political excitement. In 1848, several attempts were made by Hungarian poets to set it to appropriate verses, but without much success. The air most generally known in Germany and elsewhere out of Hungary as the Rako'czymarsch, which is introduced by Hector Berlioz in his *Damnation de Faust*, is a weak paraphrase of the original by Ruziska.

RAKSHAS, or **RAKSHASA**, is, in Hindu Mythology, the name of a class of evil spirits or demons, who are sometimes imagined as attendants on Kuvera, the god of riches, and guardians of his treasures, but more frequently as mischievous, cruel, and hideous monsters, haunting cemeteries, devouring human beings, and ever ready to oppose the gods and to disturb pious people. They have the power of assuming any shape at will, and their strength increases towards the evening twilight. Several of them are described as having many heads and arms (see, for instance, *RAVANA*), large teeth, red hair, and, in general, as being of repulsive appearance; others, however, especially the females of this class, could also take beautiful forms in order to allure their victims. In the legends of the *Mahābhārata*, *Ramayana*, and the *Puran's*, they play an important part, embodying, as it were, at the period of these compositions, the evil principle on earth, as opposed to all that is physically or morally good. In the *Puran's*, they are sometimes mentioned as the offspring of the patriarch Pulastya, at other times as the sons of the patriarch Kas'yapa. Another account of their origin, given in the *Vishnu-Puran's*, where, treating of the creation of the world (book i. chap. v.), is the following: 'Next, from Brahmā, in a form composed of the quality of foulness, was produced hunger, of whom anger was born; and the god put forth in darkness beings emaciate with hunger, of hideous aspects and with long beards. Those beings hastened to the deity. Such of them as exclaimed: "Not so, oh! let him be saved," were named Rākshasā (from *raksh*, save); others who cried out: "Let us eat," were denominated, from that expression, Yaksha' (from *yaksh*, for *jaksh*, eat). This popular etymology of the name, however, would be at variance with the cruel nature of these beings, and it seems, therefore, to have been improved upon in the *Bhagavata-Puran's*, where it is related that Brahmā transformed himself into night, invested with a body; this the Yakshas (q. v.) and Rākshasas seized upon, exclaiming: "Do not spare it—devour it!" when Brahmā cried out: "Don't devour me (*ma, mam, jakshata*)—spare me! (*rakshata*)." (See F. E. Hall's note to Wilson's *Vishnu-Puran's* a. vol. i. page 82.) The more probable origin of the word *Rakshas*—kindred with the German *Recke* or *Riese*—is that from a radical *r'ish* or *rish*, hurt or destroy, with an affix *sas*; hence, literally, the destructive being.

RALEIGH, **SIR WALTER**, the son of Walter Raleigh of Fardel in Devonshire, was born in 1552 at Hayes, on the coast of that county. In 1568, he was sent to Oxford as a commoner of Oriel College, and though his residence there was brief, gave token of remarkable ability. Only the year after, relinquishing study for adventure, he went to France as volunteer in an expedition in aid of the Huguenots; and some years subsequently we find him serving in the Low Countries in a force sent by Queen Elizabeth to assist the Dutch in their patriotic struggle against the Spaniards. Of this earlier part of his career, nothing specially remarkable is recorded. In 1579, he made his first venture in the field of activity which through life continued at intervals to attract him, sailing, in conjunction with his half-brother, Sir Humphrey Gilbert, with the purpose of founding a colony in North America. The expedition proved unsuccessful, being roughly handled by a Spanish force, and obliged to return in somewhat evil case. During the year following, R. held a captain's commission in Ireland, where, in operations against the rebels, he distinguished himself by his courage and conduct. Shortly after his return, he seems first to have attracted the notice of Queen Elizabeth, with whom he speedily rose high in favor. The story which attributes the commencement of his relations with her to his graceful gallantry in spreading before her his costly mantle as a carpet, is so well known, that it need only be glanced at in passing. For some

years forward, he was constant in his attendance upon the queen, who distinguished him by employing him from time to time in various delicate offices of trust, and by substantial marks of her favor. The spirit of enterprise was, however, restless in the man; and in 1584, a patent having been granted him to take possession of lands to be discovered by him on the continent of North America, he fitted out two ships, which soon visited what was afterwards by the gracious permission of the Virgin Queen called Virginia. Next year the beginnings of colonization were made; year after year reinforcements were sent; and between 1597 and 1602 five several Virginian expeditions were fitted out at R.'s expense. Elizabeth conferred on R. the honor of knighthood. No immediate good, if we except tobacco, came of the colony; and after some years of struggle, he was forced to relinquish his connection with it.

During the years 1587—1588, the country being menaced by a Spanish invasion, R. was actively and responsibly occupied in organizing a resistance, and held command of the queen's forces in Cornwall. In the latter year, he shared with new access of honor in the series of actions which ended in the defeat and dispersion of the great Armada, and was thanked and rewarded for his services. Shortly after (1593), in consequence of an intrigue, resulting in his private marriage with Elizabeth Throckmorton, one of the queen's maids of honor, he incurred her majesty's severe, but only temporary, displeasure. In his banishment from court, he resorted to those schemes of conquest and adventure in the New World, which formed one main dream of his life; and, in 1595, headed an expedition to Guiana, having for its object the discovery of the fabled El Dorado, a city of gold and gems, the existence of which in these regions was then generally believed in. Of this brilliant but fruitless adventure, on returning, he published an account. Having been reinstated in the royal favor, he held in 1596 the post of admiral in the expedition against Cadiz, commanded by Howard and the Earl of Essex, and was admittedly the main instrument of its success. Also, in the year following, he took part in the attack on the Azores made by the same commanders. In the court intrigues which ended in the downfall of the Earl of Essex, he after this became deeply involved; and certain points of his conduct, as notably the sale of his good offices with the queen in behalf of such of the earl's adherents as would buy them, though easily regarded by the current morality of the time, have fixed somewhat of a stain on a fame otherwise so splendid.

With the death of Elizabeth in 1603 ends the brilliant and successful portion of R.'s career. Her successor, James, from the first regarded him with a suspicion and dislike which he was at no pains to conceal. He had besides made powerful enemies—the principal of whom were Cecil and Howard. His ruin was resolved on, and means were soon found to compass it. He was accused of complicity in a plot against the king; and though no jot of evidence of his being any way concerned in it was produced at his trial, a verdict was readily procured, finding him guilty of high treason. The language of the prosecutor, Attorney-general Coke, was outrageously abusive. He called R. 'a damnable atheist,' 'a spider of hell,' a 'viperous traitor,' &c. Sentence of death was passed, but James did not venture to execute him; and he was sent to the Tower, where, for thirteen years, he remained a prisoner, his estates being confiscated, and made over to the king's favorite, Carr, subsequently Earl of Somerset. During his imprisonment, he devoted himself to literary and scientific pursuits, his chief monument in this kind being his *History of the World*, a noble fragment, still notable to the student as one of the finest models of our quaint and stately old English style. Certain of his poetical pieces, giving hint of a genius at once elegant and sententious, also continue to be remembered, and are more or less familiar to every one. In 1615, he procured his release, and once more sailed for Guiana. The expedition, from which great results were expected, failed miserably. R. himself, in consequence of severe illness, was unable to accompany it inland; and nothing but disaster ensued. To add to his grief and disappointment, his eldest and favorite son was killed in the storming of the Spanish town of St. Thomas, and he returned to England, broken in spirit and in fortunes. He returned only to die. On the morning of the 29th October 1618, in the sixty-sixth year of his age, he was infamously executed, nominally on the sentence passed on him sixteen years before, but really, there is reason to suppose, in base compliance on James's part with the urgencies of the king of Spain, who resented his persistent hostility.

R. was a man of noble presence, of versatile and commanding genius, unquestionably one of the most splendid figures in a time unusually prolific of all splendid developments of humanity. In the art and finesse of the courtier, the politic wisdom of the statesman, and the skilful daring of the warrior, he was almost alike pre-eminent. The moral elevation of the man shone out eminently in the darkness which beset his later fortunes; and the calm and manly dignity with which he fronted adverse fate conciliated even those whom his haughtiness in prosperity had offended. R.'s 'Life' has been written by Oldys, Cayley (1806); P. F.

Tytler (1833); Edwards (1868), St. John (1868); his poems were published by Sir E. Brydges (1814); his *Miscellaneous Writings*, by Dr. Birch (1751), and his *Complete Works*, at Oxford (8 vols. 1839).

RA'LEIGH, the capital of North Carolina, is six miles west of the Neuse River, near the center of the state; lat. 35° 47' N., long. 78° 48' W. The town is regularly built on an elevated site, with a central park, containing a large domed state-house, and broad streets. It contains a court-house, jail, 8 banks, 12 newspapers, 6 churches, deaf and dumb and lunatic asylums, and extensive railway connections. Pop. (1870) 7790; (1880) 14,110.

RALLENTANDO (Ital., becoming slower), a musical term, abbreviated *rallent.* or *rall.*, indicating a gradual relaxing or diminution of time.

RA'LLIDÆ, a family of birds of the order *Grallæ*, characterized by a long bill, which is more or less curved at the tip and compressed at the sides, the nostrils in a membranous groove, the wings of moderate length, the tail short, the legs and toes long and slender, the hind-toe placed on a level with the others. To this family belong rails, crakes, gallinules, coots, &c. The toes of some, as coots, are margined with a lobed membrane; but these are by some ornithologists separated from this family (see COOT). Even those R. of which the toes have no marginal membrane, are fitted, by the length of their toes, for walking on mud or ooze. Many of them swim and dive well. Most of them are aquatic, or frequent either fresh-water or salt marshes; but some, as the crakes, are found in dry situations.

RAMA is, in Hindu Mythology, the name common to three incarnations of Vishn'u, of Paras'urâma, Râmachandra, and Baharâma. See VISHN'U.

RA'MADAN, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course, from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spittle, are strictly prohibited during that period. Even when obliged to take medicine, the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence in all sorts of enjoyments. The fast of R., now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of midsummer. The sick, travelers, and soldiers in time of war, are temporarily released from this duty, but they have to fast an equal number of days at a subsequent period, when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious, are expressly exempt from fasting. We may add, that according to some traditions (Al-Beidâvi), not only Mohammed, but also Abraham, Moses, and Jesus received their respective revelations during this month. The principal passages treating of the fast of R. are found in the second Surah of the Koran, called 'The Cow.'

RAMAYAN'A is the name of one of the two great epic poems of ancient India, (for, the other, see the article MAHABHARATA). Its subject-matter is the history of Râma, one of the incarnations of Vishn'u (q. v., and see RAMA), and its reputed author is *Valmiki*, who is said to have taught his poem to the two sons of Râma, the hero of the history; and, according to this legend, would have been a contemporary of Râma himself. But though this latter account is open to much doubt, it seems certain that *Valmiki*—unlike *Vyâsa* (q. v.), the supposed compiler of the *Mahâbhârata*—was a real personage; and, moreover, that the R. was the work of one single poet—not like the *Mahabharata*, the creation of various epochs and of different minds. As a poetical composition, the R. is therefore far superior to the *Marabharata*; and it may be called the best great poem of ancient India, fairly claiming a rank in the literature of the world equal to that of the epic poetry of Homer. Whereas the character of the *Mahabharata* is cyclopædical, its main subject-matter overgrown by episodes of the most diversified nature, its diction differing in merit, both from a poetical and grammatical point of view, according to the ages that worked at its completion—the R. has but one object in view, the history of Râma. Its episodes are rare, and restricted to the early portion of the work, and its poetical diction betrays throughout the same finish and the same poetical genius. Nor can there be any reasonable doubt as to the relative ages of both poems, provided that we look upon the *Mahabharata* in the form in which it is preserved, as a whole. Whether we apply as a test the aspect of the religious life, or the geographical and other knowledge displayed in the one and the other works, the R. appears as the older of the two. Since it is the chief source whence our information of the Râma incarnation of Vishn'u is derived, its con-

tents may be gathered from that portion of the article VISHN'U which relates to *Ramachandra*.

The R. contains (professedly) 24,000 epic verses, or *S'lokas*, in seven books, or *Kan'd'as*, called the *Bala*-, *Ayodhya*-, *Arany'a*-, *Kishkindha*-, *Sundara*-, *Yuddha*-, (or *Lanka*-), and *Uttara-Kan'd'a*. The text which has come down to us exhibits, in different sets of manuscripts, such considerable discrepancies, that it becomes necessary to speak of two recensions in which it now exists. This remarkable fact was first made known by A. W. von Schlegel, who, in Europe, was the first who attempted a critical edition of this poem; it is now fully corroborated by a comparison that may be made between the printed editions of both texts. The one is more concise in its diction, and has less tendency than the other to that kind of descriptive enlargement of facts and sentiments which characterizes the later poetry of India; it often also exhibits grammatical forms and peculiarities of an archaic stamp, where the other studiously avoids that which must have appeared to its editors in the light of a grammatical difficulty. In short, there can be little doubt that the former is the older and more genuine, and the latter the more recent, and in some respect, more spurious text. A complete edition of the older text, with two commentaries, was published at Madras in 1856 (in the Telugu characters, vol. i.—lii.); another edition of the same text, with a short commentary, appeared at Calcutta in two vols. (1860), and a more careful and elegant one at Bombay (1861).

Of the later edition, Signor Gaspare Gorresio has edited the first six books (vol. i.—v., Paris 1843—1850) without a commentary, but with an Italian, somewhat free, translation in poetical prose (vol. vi.—x., Paris, 1847—1858). Former attempts at an edition and translation of the R. remained unfortunately incomplete. The earliest was that made by William Carey and Joshua Marshman, who edited the first two books, and added to the text a prose translation in English and explanatory notes (vol. i.—lii., Serampore, 1806—1810; and vol. i., containing the first book, Dunstable, 1808). Another edition, of an eclectic nature, is that by A. W. von Schlegel; it contains the first two books of the text, and an excellent Latin translation of the first book and twenty chapters of the second (vol. i., parts 1 and 2, and vol. ii., part 1, Bonn, 1846). Various episodes from the R., it may also be added, have at various times occupied sundry editors and translators.

RA'MBLA, a market-town in Spain, in the modern province of Cordova, and 23 m. south of the city of that name, stands on a hill in a district which produces abundantly grain, wine and oil. Some manufactures of coarse pottery, especially of porous water-coolers, are carried on. Pop. (1877) 6160.

RAMBOUILLET, CATHERINE, MARQUISE DE, one of the most accomplished and illustrious women of the 17th c., was born at Rome, of Italian parents, in 1588, and received a refined education under the superintendence of her mother, the Marchese di Pisani. At the age of 12 she was betrothed to a French nobleman, Charles d'Angennes, son of the Marquis de Rambouillet, who succeeded to the family estates and title on the death of his father in 1611. When the youthful marquis first appeared in the assemblies at the Louvre, she was shocked by the gross corruption of morals and manners that prevailed among the mob of courtiers, and almost immediately conceived the idea of forming a select circle for herself, which should meet at her own house—the famous Hôtel de Rambouillet. Madame de R. was admirably fitted for presiding at the reunions which have made her name famous in the literary history of France. Handsome and gracious, but free from coquetry and all personal pretensions, her affability, generosity, and steadfast attachment to her friends, made her an object almost of worship to those who enjoyed her society. The writers of that epoch are unanimous in the expression of their homage. The characteristic feature of the Rambouillet circle was the intercourse, on terms of equality, of the aristocracy of rank and the aristocracy of genius. There, for the first time, do we meet with a generous and adequate recognition of the dignity of letters. For fifty years the *salons* of the marquise were hospitably open to the wits, critics, scholars, and poets of Paris, beginning with Malherbe and Racan, followed by that distinguished circle of *beaux esprits* who contributed so much to the formation of the French language and taste—Costar, Sarrazin, Comart, Patru, Balzac, Segrais, Godeau, Voiture, and Corneille; and closing with the generation who filled up the interregnum from Corneille to Molière. Scarron, Saint-Evremond, Beiserade, the Duc de Laroche-foucauld, &c.

Many of the literary débuts of celebrated geniuses were made at the Hôtel de Rambouillet. Here Corneille read his first piece, *Mélite*, and Armand du Plessis, afterwards Cardinal Richelieu, sustained a *Thèse d'Amour*, and Boileau preached one of his earliest sermons. But the Hôtel was almost as much renowned for the brilliant and accomplished women who frequented it, as for its crowd of professional literateurs. The names of Mademoiselle de Scudéry, of Mademoiselle Coligny—afterwards Comtesse de la Suze—and of the Marquise de Sablé, who inspired the

Maximes of Larocheffoucauld, are among the most distinguished of their time and country; but above them all, as conspicuous by her splendid beauty as by her faultless grace of manner, the center and idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde—the Duchesse de Longueville. The combined influence of so many different sorts of *esprit* exercised a profound and lasting influence on the literature and society of the 17th c., and is considered—rightly, as we think—to have developed quite a new art—that of lively, polished conversation, in which France has ever since taken the lead, and has thus placed itself socially in the front of European civilization. It has been customary to say that the *Précieuses Ridicules* of Molière was aimed at the foibles of the Rambouillet coterie. But this notion has been shown to be entirely groundless. The *Précieuses Ridicules* was actually first performed at the Hôtel, and Molière, in the preface to his *Femmes Savantes*, protests against the supposition that he meant to reflect on a circle which he affirmed had every claim to respect. It appears from investigation, that grotesque imitations of the manners and style of the Hôtel, had, in the course of years, become prevalent both in Paris and the provinces, and that it was these, and not their charming prototype, which were exposed to the satire of Molière. Madame de R. died at Paris, 2d December, 1665.—See Rödérer's *Mémoire pour servir à l'Histoire de la Société polie en France pendant le dix-septième Siècle*; and Victor Cousin's *Jeunesse de Mde. de Longueville*, *Mde. de Sablé*, &c.

RAMEAU, JEAN PHILIPPE, an eminent French musician, born at Dijon, in 1683, and son of the organist of the Sainte Chapelle there. He showed a genius for music almost from infancy, and with a view of devoting himself to it as a profession, set out for Italy at the age of 18, but proceeded no further than Milan. After traveling through France, and acquiring a considerable reputation as a performer on the organ, he was appointed organist of the cathedral of Clermont, in Auvergne, and wrote while there his *Traité de l'Harmonie*, a work of some note in musical literature, which was published in Paris in 1722. Removing to Paris, he became organist of Sainte Croix de la Bretonnerie, and published various other treatises connected with the theory of music. In 1733, at the mature age of 50, he produced his first opera, *Hippolyte et Aricie*, the drama of which was written by the Abbé Pellegrin. It created a great sensation, and R. was forthwith elevated to the position of a rival to Lulli as an opera composer, musicians being divided in their partisanship of the two artists. R.'s best opera was *Castor et Pollux*, produced at the Académie Royale de Musique, in 1737; it contains one chorus which has hardly been surpassed in the whole range of theatrical music. Between 1733 and 1760, he composed 21 operas and ballets, as well as numerous harpsichord pieces. His works on harmony acquired for him a deservedly high reputation as a musical theorist; he has been called the Newton of musical science. Louis XV. created for him the office of Cabinet Composer, granted him letters of nobility, and named him a Chevalier de St. Michel. R. died in 1764.

RAMESSES, RAMESSES, or RAMSES, the name of several Egyptian monarchs, some of whom were known to the Greek and Roman writers and the chronologists; the name signifies 'born of the sun' or the 'nascent sun.' The R. family is supposed to have been of Theban origin, and to have been descended from one of the later queens of the 18th dynasty. The exploits of R. are confounded by the Greek and Roman authors with those of Sesostris (see SESOSTRIS), and mingled in the legend of Armais, the Danaus of the Greeks. R. is said to have had a great army and navy, and at the head of a force of 700,000 men, to have conquered Ethiopia, Libya, Persia, and other eastern nations. Before leaving his kingdom for these distant expeditions, he is said to have appointed his brother Armais or Danaus regent of the kingdom, charging him neither to assume the diadem, nor interfere with the royal harem. R. then proceeded to conquer Cyprus, Phenicia, the Assyrians and Medes, Armais contravened his orders; and R., informed of this by the high priest, suddenly returned to Pelusium, and resumed the kingdom, expelling his brother, who, fleeing with his daughters, the Danaids, to Argos, established himself in Greece. According to the Roman authors, however, Troy was taken in the reign of Rameses. The walls of the temples of Thebes were said to be covered with inscriptions and scenes recording his conquests and the tributes rendered to him, and these were interpreted to Germanicus by the priests on his visit to Egypt. Such is the account given of a monarch called R. by the classical authors. The following are the principal princes and monarchs of this name, found on the monuments of Egypt.

1. A prince or king represented with the royal families of the 18th dynasty in a sepulchre at Thebes.—2. R. I. chief of the 19th dynasty, who reigned but a short time, and whose name is found on the monuments of Thebes and the Wady Halfa.—3. R. II., or Great, who mounted the throne at a very early age, conquered the Khita or Hitites, and other confederate nations of Central Asia, in his 7th year, and concluded an extraordinary treaty with the

Khita in his 21st year. Other nations, European and African, fell under his sway, and his empire extended far south in Nubia, the ancient Ethiopia, which he governed by viceroys. He erected fortresses and temples in foreign lands, and embellished all Egypt with his edifices. He had two wives, twenty-three sons, and seven daughters, and was finally buried in the Biban-El-Melook. He is the supposed Sesostris, according to most authors. He reigned 68 years.—4. R. III., chief of the 20th dynasty, the Rhampsinitus of Herodotus, called Meriamoun, or beloved of Animon, who defeated the Philistines the Mashuash, and the Libyans, carrying on important wars from the 5th to the 12th year of his reign; he also made conquests in the 16th, and seems to have reigned 55 more years. He founded the magnificent pile of edifices of Medinat Habu, embellished Luxor, Gurnah, and other parts of Egypt. Some attribute to him the exploits of the R. of the Greek and Roman writers.—5. R. IV. reigned a short time, and performed no distinguished actions.—6. R. V., of whom inscriptions are found at Silsilis.—7. R. VI., whose tomb at the Biban-El-Meluk contains some astronomical records from which the date of his reign has been calculated at 1240 B.C.—8.—12. R. VII., VIII., IX., X., and XI., undistinguished monarchs.—13. R. XII., who reigned above 33 years, in whose reign the statue of the god of Chons was sent from Egypt to the land of the Bakhten, to cure a princess of the royal family of that court, with which R. had contracted an alliance.—14. R. XIII., an unimportant monarch.

RAMESSES is also the name of one of the fortresses or treasure-cities built by the Hebrews during their residence in Egypt. The name of this fortress, all important for the date of the Exodus—placed 1491 B.C. by the old chronologists, and 1314 B.C. by Lepsius—is found in the papyri of the British Museum in documents of the age of Meneptah, while R. III. is represented at Medinat Habu in one of his campaigns marching out of the Magdol of Rameses. The situation of Rameses has much puzzled geographers and commentators, and it has been supposed to be Abaris, Baal-Zephon, Heroopolis, Pelusium, and Abu-Kescheh. Notwithstanding the opposition to dating Fort Rameses in the period of the 19th dynasty, it is now generally admitted to have been constructed at that period. In fact, no fort was ever named by the appellation of a prince, it being the prerogative of the monarch to have the fortress named after him. The evident solution of the difficulty is, that the exodus of the Hebrews took place under a king Rameses, at whatever chronological period his reign may have happened.—A remarkable discovery of royal mummies, papyri, and other relics was made in a pit near Thebes in 1881. Amongst the mummies were those of Rameses I. and Rameses II., which had probably been removed and concealed here on occasion of some hostile invasion.

RAMEE, an East Indian name, often used, for the BÖHMERIA (q. v.) NIVEA.

RAMILLIES, a small village of Brabant, Belgium, 28 miles S.E. of Brussels, is memorable as the place near which one of the most important battles of the War of the Spanish Succession was fought, May 23, 1706. In this conflict, the French forces were under the command of Marsial Villeroi and the Elector of Bavaria, while Marlborough led the troops of the Allies. Villeroi, after a battle of three hours and a half, was defeated, with the loss of almost all his cannon, the whole of his baggage, and 13,000 men in killed and wounded. The great result of this victory was that the French were compelled to give up the whole of the Spanish Netherlands.

RA'MMELSBERG, one of the Harz Mountains, rather less than 2200 feet high, and celebrated for its mines, which yield gold, silver, lead, zinc, copper, sulphur, vitriol, and alum. They have been worked, according to tradition, from the year 963; and their possession was for ages a source of strife between the inhabitants of Goslar (q. v.) and the Dukes of Brunswick.

RAMMOHUN ROY, a celebrated Hindu rajah, was born at Bordnan, in the province of Bengal, between 1774 and 1780. In a sketch of his own life, written in 1832, he states that his ancestors were Brahmans of a high order. At home, he acquired the usual elements of native education, with some knowledge of the Persian language. At Patna, and afterwards at Benares, he studied Sanscrit, and the works written in it, which contain the spirit of Hindu law, literature, and religion. At a very early age, he began to compare the evidence for and against the various religious doctrines held by those around him; nor did he except from this investigation those doctrines in belief of which he himself had been brought up. Finding them all repugnant to his vigorous understanding, he boldly acknowledged this fact both to himself and to the world. The result was a quarrel with his father, his family, and his community. He appears, indeed, to have succeeded in converting the understanding of his mother; but it, in its turn, was overcome by her sentiment. 'You are right,' she said to him, when she was about to set out on a pilgrimage to Juggernaut; 'but I am a woman, and cannot give up

observances which are a comfort to me.' R. R. spent two or three years of his youth in Tibet, where he excited general anger by denying that the Lama was the creator and preserver of the world.

For a long time, he had a strong, and, perhaps, not unfounded dislike to the English; but becoming convinced that their sway was, on the whole, beneficial to India, his views changed, and he applied himself to the study of the English language. For five years, he held the office of Revenue Collector in the district of Rungpoor. In 1803, his father died, but left him no part of his estate. In 1811, however, by the death of his brother, he succeeded to affluence. 'After my father's death,' he says, 'I opposed the advocates of idolatry with still greater boldness.' He published various works in Persian, Arabic, and Sanscrit; the object of the whole being the uprooting of idolatry. He also issued in English an abridgment of a work called the *Vedant*, giving a digest of the Vedas, the ancient sacred books of the Hindus. Becoming more convinced, as he grew older, of the excellence of the moral theories of Christianity, in 1820 he published *The Precepts of Jesus, the Guide to Peace and Happiness*. It appears from this work, that while he believed in the morality preached by Christ, he not believe in the divinity of the preacher. He rejected the miracles also, and other portions of the gospel held to be fundamental in the various churches of Christendom. The book, therefore, as was to have been expected, met with severe ecclesiastical censure, the grounds of censure being various and conflicting. In April 1831, the rajah visited England. The great question of parliamentary reform was then agitating the country. Of the Reform Bill he wrote, that it 'would, in its consequences, promote the welfare of England and her dependencies; nay, of the whole world.' His society was universally courted in England. He was oppressed with invitations to attend social parties, and political and ecclesiastical meetings. His anxiety to see everything and to please all, led him to overtask himself to such an extent that his health, long failing, at last quite broke down. He died at Bristol, September 27, 1833. The adverse circumstances of his birth were such as might easily have enslaved even his powerful understanding, or still more easily, might have perverted it to selfish ends; but he won his high position by an inflexible honesty of purpose and energy of will.—See Sketch of his Life, written by himself, in the *Athenaeum*, No. 310, October 5, 1833; also *Chambers's Edinburgh Journal*, August 2, 1834.

RAMNA'D, a town of British India, in the district of Madura, presidency of Madras, 125 miles north-east from Cape Comorin, and about five or six miles from the shore of Palk's Bay. In the center of the fort is the palace or residence of the zemindar, one of the greatest of his class in the south of India, his extensive possessions containing more than 2000 villages, and nearly 300,000 inhabitants. Pop. about 13,000, of whom 6000 dwell within the fort.

RAMNEGHA'R, or **RAMNUGGUR** (Town of God), formerly called **RASULNUGGUR**, a walled town of the Punjab, beautifully situated in an extensive plain on the left bank of the Chenab, 65 miles north-west of Lahore. There is here a ferry across the river, which is 300 yards wide, and 9 feet deep; but two miles lower there is a ford, at which the depth is only 3 feet, when the water is at its lowest. The town is surrounded by walls, and contains eight well-supplied bazaars. Pop. stated at 11,000.

RAMNEGHA'R, or **RAMNUGGUR**, a town of British India, N.-W. Provinces, in the district of Benares, and four miles south of the city of that name, on the right bank of the Ganges. Its fort, the residence of the rajah, rises from the banks of the sacred stream by a number of fine ghats or flights of stairs. Pop. (1872) 11,953.

RAMP, a sudden upward curve in the hand-rail of a stair.

RAMP, in Fortification, is a gradual slope by which approach is had from the level of the town or interior area to the terreplein or general level of the fortifications behind the parapet.

RAM'PANT (Fr. literally, 'raging'), in Heraldry, an epithet

Rampant.

applied to a lion or other beast of prey when placed erect on the two hind-legs, with only one of the fore-legs elevated, the head being seen in profile. When the face is turned towards the spectator, the attitude is called *rampant gardant*, and when the head is turned backwards, *rampant regardant*. A lion *counter-rampant* is one rampant towards the sinister, instead of towards the dex-

ter, the usual attitude. Two lions rampant contrary-ways in saltier, are sometimes also said to be counter-rampant.

RAM'PART, forms the substratum of every permanent fortification. See **FORTIFICATION**. It constitutes the enceinte, and is constructed immediately within the main ditch by throwing up the soil excavated from it. On the front of the rampart, the parapet is raised, and width should be left behind it to allow of guns, wagons, and troops passing freely on the top of the rampart. The height of the rampart is dependent on the relief (height) of the buildings to be defended, and on the positions in the neighborhood which an enemy might assume.

RAMPHA'STIDÆ. See **TOUCAN**.

RAMPION (*Campanula rapunculus*; see **CAMPANULA**), a perennial plant, a native of Europe, rare in England, with a stem about two feet high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovato-lanceolate and

Rampion.

waved. The root is white and spindle-shaped, and was formerly much used for the table, under the name of *Rampion* or *Ramps*. The plant is now little cultivated in Britain, but is still commonly cultivated in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

RAMSAY, ALLAN, an eminent Scottish poet, was born in the parish of Crawford, Lanarkshire, October 15, 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. To this maternal descent, we may perhaps trace Allan's peculiar frankness and gaiety of temperament. In his 15th year (by which time he had lost both of his parents), he was put apprentice to a wigmaker in Edinburgh. He had received the ordinary education of a parish school, and could read Horace, as he says, 'faintly in the original.' Up to his 30th year he continued to follow the occupation of a wigmaker; and by this time, he had become known as a poet, having issued several short humorous pieces, printed as broadsides, and sold for a penny each. He had also written (1716–1718) two additional cantos to the old Scots poem of *Christ's Kirk on the Green*, attributed to James I. These two cantos gave such genuine pictures of rustic life, and presented such felicitous scenes of broad humor, that it was obvious their author was destined to become the restorer of Scottish poetry. Patronized by the highest and worthiest of the land, R. now abandoned wigmaking, and commenced business as a bookseller. His shop was opposite 'Niddry's Wynd,' and he placed a sign of Mercury over his door. Subsequently, as his success increased, he removed to the Luckenbooths, and depositing Mercury, set up heads of Drummond and Ben Jonson. He also added to his business a circulating library, the first established in Scotland. From 1718, when he opened shop as a bookseller, down to 1755, when he retired to a villa of his own erection, R.'s career, worldly and literary, was eminently prosperous. He was careful and industrious, determined, he said, to show the world that *poortith*, or poverty, was not 'the poet's lot;' and though he was always courting patronage, he never selected a fool for his patron, nor did his pride and vanity as a poet ever withdraw him from business.

The following are his principal works: *Tartana, or the Plaid*, 1721; a collected edition of his *Poems*, published by subscription in 1721, by which it is said the poet realized 400 guineas; *Fables and Tales*, 1722; *Fair Assembly*, 1723; *Health, a Poem*, 1724; *The Tea-table Miscellany*, a collection of the most choice songs, Scottish and English, 1724, to which a second volume was published in 1725, a third in 1727, and a fourth in 1740; *The Evergreen*, 'being a collection of Scots Poems wrote by the Ingenious before 1600,' published in 1724; *The Gentle Shepherd, a Pastoral Comedy*, 1725,

to which songs were added in 1728; a second collection of *Poems* published by subscription, 1728; *Thirty Fables*, 1730. Of most of these publications, numerous editions were called for, no less than nine of the *Tea-table Miscellany* being issued in nine years. One brief cloud overcast the poet's successful career. He entered into a speculation for the encouragement of the drama, and built a theater in Edinburgh, which was almost immediately shut up by the magistrates, in virtue of the act passed in 1737 prohibiting all dramatic exhibitions without special license. This affair was a serious loss to the poet, and subjected him to the annoyance of attacks from poetasters and morose religionists, such as 'A Looking-glass for Allan Ramsay,' 'The Dying Words of Allan Ramsay,' 'The Flight of Religious Piety from Scotland upon the account of Ramsay's Lewd Books and the hell-bred Playhouse Comedians,' &c. Allan bore all with Horatian philosophy and indifference; but he addressed a poetical epistle to his friend, Duncan Forbes of Culloden, then Lord Advocate, claiming compensation for his losses, or, at least, that he might be 'edged into some canny post.' This request does not seem to have been complied with, but Allan had amassed a decent competency. The last two or three years of his life were spent in cheerful retirement in the quaint but picturesque house he had built on the north side of the Castle Hill, and there he died on the 7th of January 1758. He had the gratification of seeing his only surviving son, ALLAN RAMSAY (born in 1718, died in 1784), fast rising into distinction as a portrait-painter, and esteemed by the most eminent men of his day as an accomplished scholar and gentleman.

This second Allan Ramsay had been carefully educated by his father, and sent to Rome to study art. On his return, being introduced to the Prince of Wales, afterwards George III. he rapidly rose into favor; and in 1767 was appointed principal painter to the king.

The *Gentle Shepherd* of R. is his greatest work, and, indeed, is esteemed as the best pastoral in any language. Its characters are realities not shadowy Corydons' or Phyllises, maundering over crooks, or sleeping to the murmur of bees. It contains faithful transcripts of actual life and feeling, such as the poet had witnessed in his youth on the banks of the Clyde and Glengonar. The poetry, too, abounds in graphic expression and touches of homely nature and arch humor, that to Scotsmen are irresistible, while the plot is skillfully constructed, and brings out rustic character, customs, and superstitions. Some of R.'s tales and fables are amusing, but coarse. His songs also are occasionally defective in respect of simplicity and delicacy, though he has made some exquisite additions to our lyrical poetry. In his Jacobite allegory, *The Vision*, he rises into the higher region of inspiration, apparently imitating and certainly rivaling Dunbar. As an editor, he has been censured for tampering with the works of the old bards, retouching, adding, or retrenching at his pleasure. But he also rescued many choice productions of the elder muse from neglect, and awakened in Scotland a taste for its native literature. A complete edition of his poems with a biography was published by Chalmers (1800; new ed. 1874); a fine edition, with the music of the songs, and engravings by David Allan, in 1879. A monument to R. was erected in Edinburgh in 1865.

RAMSDEN, JESSE, a celebrated instrument-maker, was born at Salterhebble, near Halifax, Yorkshire, in 1735. He received a good education, and, after being engaged as a cloth-worker, and become (1762) a working engraver and divider in London, and having married Dollond's (q. v.) daughter, received, as her dowry, a share in his father-in-law's patent for achromatic telescopes. The sextants of his time were very imperfect, being untrustworthy within 5' of a degree, and R. succeeded in reducing the possible error to within 30". His skill thus shown, and the cheapness of his instruments (two-thirds of the price charged by other makers), soon created such a demand as tasked his utmost energy to meet. To increase the amount and improve the quality of the work done by his men, he introduced the principle of the division of labor, besides inventing a dividing-machine, which could graduate instruments much more rapidly and accurately than could be done by hand. For this invention, he received from the Board of Longitude a premium of £615. He constructed the theodolite used by General Roy (q. v.), and also telescopes for the observations of Blenheim, Mannheim, Dublin, Paris, and Gotha, and mural quadrants for those of Padua and Vilna, the accuracy of all of which was a matter of admiration and delight among astronomers. He was one of those who strongly recommended the introduction of the mural circle in place of the Quadrant (q. v.), and he constructed two of the former instruments for the observatories of Palermo and Dublin. The minor scientific instruments invented or improved by him are also numerous. He died at Brighton, 5th November 1800, leaving a moderate fortune, a large portion of which was, in accordance with the terms of his will, divided among his workmen. R. was a member of the Royal Society, a Fellow of the Imperial Acad-

emy of St. Petersburg, and the possessor of a Copley medal (the gift of the Royal Society).

RA'MSEY, a town in the Isle of Man, lying 16 miles north of Douglas, and which, from the beauty of its situation and the salubrity of its climate, is rapidly becoming a favorite resort of tourists and pleasure seekers. It stands on the margin of a spacious bay, and has a background of lofty and well-wooded hills. The anchorage in the bay is good, and the waters abound in mackerel, herrings, salmon, and other fish. An extensive ship-building yard has recently been opened here, which gives occupation to about 300 men. A public promenade and inclosure on the foreshore have been made; and extensive harbor-works erected. Steam-packets run regularly from R. to Liverpool and to Whitehaven, and the town is connected with Douglas by railway. Pop. (1871) 3984.

RA'MSGATE (*Rium's Gate*; *Rium* is the British name of Thanet), a seaport and watering-place in the south-east of the Isle of Thanet, 97 miles east-south-east of London by railway. Anciently, it was a small fishing-village; but it began to increase in importance about the beginning of the 18th c., when a number of its inhabitants opened up a successful trade with 'Russia and the east country.' The recently-built portion of the town consists of well-arranged streets, crescents, and terraces; and the older part is situated in a natural depression or cutting in the chalk-coast, opening out toward the sea, and called in this district a 'gate' or 'stair.' R., as a watering-place, is slightly more aristocratic than Margate (q. v.); and during the season, which lasts from the middle of summer to the end of autumn the charges are very high. At the height of the season, the population of R. is increased to above 20,000. The climate is much more bracing than that of the southern coast, and exercises a salutary influence in cases of scorbutic disorder.

The harbor of R.—40 acres in extent, and enclosed on the east by a splendid pier 8000 feet in length, and on the west by another pier 1500 feet long—serves as a harbor of refuge for the Downs. About 1½ miles west of R. is Osengall Hill, on which a number of Saxon and several Roman graves have been recently discovered, and a large number of most interesting relics, as spear-heads, coins, ornaments in silver, &c., armor, glass and amber beads, &c., found. (See Wright's *Wanderings of an Antiquary*.) Ship-building and rope-making are here carried on, and coal is imported. In 1880, 875 vessels, of 112,216 tons, entered the port. Pop. (1871) 14,640; (1881) 22,605.

RAMSHORNS, in Fortification, are semicircular works of low profile in the ditch, which they sweep, being themselves commanded by the main works. They were invented by M. Belidor, a great French engineer, and when used, take the place of *Tenailles* (q. v.).

RA'MSKIN, a species of cake, which consists of grated cheese of some dry kind, such as Parmesan or the white hard English varieties, incorporated with dough as prepared for fine puff-pastry; then rolled out, and cut into shapes, glazed with white of egg, and baked for a quarter of an hour. It is usually eaten hot. This dish is said to have been invented at Croxteth Hall, the seat of Lord Sefton, whence it is sometimes called 'Sefton fancy.'

RAM-TIL (*Guizotia oleifera*), a plant of the natural order *Compositæ*, suborder *Corymbifera*, a native of the East Indies and Abyssinia, much esteemed for the bland oil which is obtained from the seeds, and which is employed for the same purposes as olive oil. The R. is extensively cultivated in India, chiefly in Mysore, and to some extent also in Abyssinia.

RAMUS (Latinized form of *La Ramée*), PIERRE, an illustrious French 'humanist,' was the son of a poor laborer, and was born at the village of Cuthi, in Vermandois, in 1515. His thirst for knowledge was so great, that twice before he had reached his 12th year, he traveled on foot to Paris, with the hope of getting into some school there, but the misery of want twice drove the brave boy home again. In his 12th year, however, he got a situation as servant to a rich scholar at the Collège de Navarre; and by devoting the day to his master, obtained the night for study, and made rapid progress. The method of teaching philosophy then prevalent dissatisfied him, and he was gradually led to place a higher value on 'reason' than on 'authority,' contrary to the mental habit of his time. His contempt, indeed, for 'authority' blinded him (as is often the case with a young reformer) to what truth 'authority' might contain, and when taking his degree of M.A., in his 21st year, he maintained the extravagant thesis, that 'all that Aristotle had said was false' *quoniam ab Aristotele dicta essent, commentitia esse*. It says a great deal for the ability he showed on this occasion, that his judges, although themselves Aristotelians, were compelled to applaud him. Immediately after, R. became a teacher in the Collège du Mans, and along with two learned friends opened a special class for reading the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a

teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to 'reform,' and no one acquainted with his system, will deny that many of his innovations were both rational and beneficial. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Dialectica Partitiones*) appeared in 1543, it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by a royal edict, and even barbarously demanded that its author should be sent to the galleys. But R. had (at this time) two powerful friends, Cardinals Charles de Bourbon and Charles de Lorraine, who protected him from personal injury, and through whose influence he was, in 1545, appointed principal of the Collège de Presles, which he raised from a condition of decay to the most splendid prosperity.

In 1551, Cardinal Lorraine succeeded in instituting for him a chair of Eloquence and Philosophy at the Collège Royal; and his inaugural address (*Pro Philosophica Disciplina*, Par. 1551) is reckoned a masterpiece of the kind. He devoted the first eight years of his teaching to the first three of the 'liberal arts' (Grammar, Rhetoric, and Logic), which he called elementary or exoteric, and published three grammars successively, Greek, Latin, and French. He also mingled largely in the literary and scholastic disputes of the time, and on account of his bustling activity, came under the satire of Rabelais. But though R. had innumerable adversaries, he might have defied them all, so great was his influence at court, had his love of 'reformation' not displayed itself in 'religion' as well as in logic. In an evil hour (for his own comfort), he embraced Protestantism. He had long been suspected of a leaning that way, and, as we have seen, his intellect was by nature scornfully rebellious towards the *ipse dixit* of 'authority'; but he had for years decently conformed to the practices of the Catholic cult, and it was only after Cardinal Lorraine, in reply to the Conference of Poissy (1561), frankly admitted the abuses of the church and the vices of the clergy, that he ventured formally to abjure the older faith. The outbreak of the religious wars in France plunged him into the dangers of the time, and he finally perished in the fatal massacre of St. Bartholomew, August 1572. It is believed that he was assassinated at the instigation of one of his most violent and persistent enemies, Charpentier, Rector of the Collège de Presles.

R. holds a most honorable place in the list of intellectual reformers. His assault on scholasticism as a *method of thinking* is vigorous, and, on the whole, well directed; his exposure of its puerile and useless subtleties is thorough, and entirely in accordance with later criticism. In his contempt for the illiterate worship of Aristotle, in his admiration for Plato and of the ancient orators and historians, he ranks (though late) with the scholars of the Renaissance; but in his assertion of 'reason' as the supreme criterion of truth, he must be regarded as the forerunner of Descartes and the modern world. His system of logic, by which perhaps his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but (like every pre-Baconian system) it fails to realize the supreme importance of the inductive method. What strikes one most, however, in R. is not so much his particular achievements, as his universal intellectual activity. He was the first mathematician of his age in France, and wrote treatises on arithmetic, geometry, and algebra, which were text-books for a hundred years; he was among the earliest adherents of the 'Copernican' system of astronomy, and in natural philosophy avowed himself an enemy to hypotheses and abstractions; rhetoric, morals, theology, all engaged his pen, and he seldom handled a subject which he did not to some degree elucidate. His followers were a widespread, and for long a powerful body of thinkers and teachers. France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain, had their *Ramists*, as they were called, and they have disappeared chiefly because their tendencies are embraced in the broader and more critical methods of modern scientific inquiry. A list of his writings is given in the *Novelle Biographie Universelle*, article 'Ramus.'—See Waddington's *Ramus, sa Vie, ses Ecrits, et ses Opinions* (Paris, 1855); E. Saisset's *Les Précurseurs de Descartes* (Paris, 1862); and C. Desmazes's *P. Ramus, Professeur au Collège de France, sa Vie, ses Ecrits, sa Mort* (Paris, 1864).

RA'NA and RA'NIDAE. See FROG.

RANCE, ARMAND JEAN LE BOUTHELIER DE, the well-known founder of the reformed order of La Trappe (see TRAPPISTS), was born January 9, 1626, at Paris, where he was educated. Having taken his degree in the Sorbonne with great applause, and embraced the ecclesiastical profession, he soon became distinguished as a preacher, and through the favor of Cardinal Richelieu, obtained more than one valuable benefice. He succeeded, while yet a young man, to a large fortune, and for a time, notwithstanding his clerical character, was carried away by the gaiety and dissipation of Parisian life. After a time, however, having forfeited the favor of Cardinal Mazarin, and being deeply moved

by the death of a lady, the Duchess de Montazon, to whom he was much attached, he withdrew from Paris, and after a time resolved to sell all his property, to distribute the proceeds among the poor, and to devote himself exclusively to the practice of piety and penitential works. Finally, he resigned all his preferments (of which, by the abusive practice of the period, he held several simultaneously), with the exception of the abbacy of La Trappe, to which convent he retired in 1662, with the intention of restoring the strict discipline of the order. The history of the reforms which he effected will be found under the head TRAPPIST. He lived in this seclusion for 33 years, during which he published a large number of works, chiefly ascetical. The only remarkable event of his literary life was his controversy with Mabillon, in reply to his *Etudes Monastiques*, on the subject of the studies proper for the monastic life. R.'s work is in 4to, 1692. In his youth, he had edited *Anacron*, in one volume octavo (Paris, 1639), with a dedication to Cardinal Richelieu. He died October 27, 1700.

RANCHE'ROS (from the Spanish *rancho*, comradeship) is the name given in Mexico to a mixed breed of Spanish and Indian blood, who inhabit the country, and may almost be said to live in the saddle from their youth, are splendid riders and hunters, and form the bravest part of the Mexican army—its irregular cavalry. The importance of their services was seen in the wars with the United States. The R. are lank in frame, with brown weather-stained faces and muscular limbs, hardy, temperate, and always ready for the boldest enterprises. They practice polygamy.

RANCIDITY. See OILS AND FATS.

RANDA'ZZO, a town of Sicily, in the province of Catania, at the base of Mount Etna, and eight miles north-by-west from its summit, on the Cantara. It crowns the summit of a low cliff of lava, and ascends the slope above, with brown battlemented walls and Norman towers, so medieval in its whole appearance, that it has been likened to 'a town of the middle ages preserved as a curiosity.' R. is believed to have been founded by the Lombard adventurers who assisted Count Roger in his conquest of Sicily. Pop. (1871) 7945.

RA'NDERS, a town in Jutland, chief town of the *Amt* or bailiwick of the same name, is situated on the Guden, at its entrance into the Randers-Fiorde, 20 miles from the mouth of the latter in the Cattegat. Though still fortified, it has much declined from its early *prestige* and importance. Brewing, distilling, and the manufacture of gloves, which are in high repute, and of stockings and cloth, are carried on. Pop. (1870) 11,854; (1880) 13,457.

RANDOLPH, JOHN, OF ROANOKE, an American statesman, was born at Cawsons in Chesterfield County, Virginia, June 2, 1773. He was descended from an ancient and wealthy family, and boasted that the Indian princess Pocahontas was one of his ancestors. Educated at Princeton and Columbia Colleges, he embraced the profession of the law, and in 1799 was elected to Congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity, and for thirty years was more talked and written of than any American politician. Tall and meagre, peculiar in dress and manners, he was described as a strange mixture of the aristocrat and the Jacobin. He was the Democratic leader of the House of Representatives, but quarrelled with Jefferson, and opposed the war of 1812, and the Missouri Compromise, and stigmatized the Northern members who voted for it as 'Dough-faces.' In 1822 and 1824, he visited England where his eccentricities attracted much notice. In 1825, he was chosen United States' senator from Virginia, and in 1830 appointed Minister to Russia. By his will, he manumitted 318 slaves, and provided for their maintenance in a free state. He died in Philadelphia, June 24, 1838. See *Life of John Randolph*, by Garland (2 vols., New York, 1850).

RA'NELAGH, a village forming part of the suburb of Dublin, is situated two miles south from the center of the city. It consists of one principal street with a square, but is surrounded by villas. The pop. is about 3500.

RANGE, in Gunnery, is the distance between a point on the ground vertically below the muzzle of the piece and the point on the same level at which the projectile touches in its descent. The point-blank range is when the piece is fired in a horizontal position; the range then increases with the elevation; and if the air opposed no resistance, the greatest range would be attained with the piece elevated at an angle of 45°; but in practice this angle is found to be, on an average, a little over 30°. As the resistance of the atmosphere increases as the square of the velocity of the shot, being also in the direct ratio of its front section, while the momentum is as the velocity multiplied by the weight; it follows that a heavy shot should have a greater range than a light one; that of two shots of the same weight, an elongated cylinder of small diameter has a longer range than a spherical ball of greater diameter. On the other hand, from the rapid increase in a duplicate ratio of the resistance, as compared with the initial velocity, the

range only increases to a certain point, in consequence of a more rapid flight of the projectile. The longest range yet attained has been by Sir Joseph Whitworth with a 9-inch rifled gun, with which he sent a bolt a distance of 11,243 yards, or 6 miles 683 yards.

RANGOON, the principal seaport and chief town of Pegu (q. v.), is built on the left bank of the Rangoon River, the eastern branch of the Irrawaddi, at the distance of 26 miles from the sea, in lat. 16° 42' N. and long. 96° 18' E. R. was founded or rebuilt by the great Alompra in 1755. The British flag was first planted in the town, May 1824, when the Anglo-Indian troops took possession of it at the commencement of the first Burman war. The second Burman war began with the bombardment of R., April 11, 1852, and it was captured April 14, by the united forces of Bengal and Madras. At the close of the contest Pegu was annexed to British India, and R. became a part of the same territory. Pop. (1869) 87,553; of whom 1627 were Christians, 11,997 Mohammedans, 5998 Hindus, 62,054 Burmese, and 5887 others. Pop. (1872) 98,745. A great change has taken place in R. under the dominion of the British, and large sums have been expended on its improvement. Capital roads and streets now intersect every part of the town. The native town is of a very mean appearance, but many substantial buildings of brick or stone have been erected by the European inhabitants. R. possesses a government naval yard, and a patent slip for repairing ships.

R. is a stronghold of Buddhism, and on every side are seen gigantic monuments, that from age to age have been erected by the followers of Gau-ta-ma; pagodas, temples, images, wonderful in their vastness and grotesque splendor. Of these, the most notable is the famous *Shogy Dagon*, or Golden Dagon dagoba, or shrine, the foundation of which is said to have been laid 2300 years ago. It lies about two miles north of the town, on elevated ground, and the area on which it stands is 800 feet square. The dagoba itself is a stupendous mass of solid masonry, tapering gradually from an octagonal base of 1355 feet to a spire of small circumference, which is surmounted by the sacred *tee*, or umbrella of open iron-work. The whole building is one dazzling blaze of gold, and altogether forms a most magnificent object, its magnitude and massiveness being very remarkable. This celebrated monument derives its peculiar sanctity from being the depository, according to Burman tradition, of relics of the last four Buddhas—viz., the staff of Kan-tha-than, the water-dipper of Gau-na-gon, a garment of Ka-tha-pa, and eight hairs from the head of Gau-ta-ma. The shrine is surrounded by numerous temples, containing colossal images of Gau-ta-ma, richly gilt, and sitting in solemn conclave, cross-legged, like so many tailors at a Quaker's meeting.

R., possessing a continuous water-communication with the upper provinces and the Burman kingdom, is very favorably situated for internal as well as for foreign commerce. There are 5 lighthouses on the Burmese coast to guide vessels to the port. Teak-timber and rice are the principal exports by sea, but they also include cotton, cutch, hides, ivory, jade, kerosine, petroleum, precious stones, shell lac, and tobacco. The imports by sea consist of betelnut, cotton twist, cotton piece goods, crockery, cutlery, hardware, silk and woollen piece goods, raw silk, spirituous liquors, and wines. The annual value of exports from R. amounts to above £2,500,000, and this sum is exceeded by the value of the imports. The town is fortified and garrisoned. An English newspaper is published here.

RANK.—*Army rank* is somewhat confusing from its varieties, and from the fact that the same officer may hold at once three different ranks. The first and only rank up to the grade of captain is *regimental* or *substantive* rank. Above this, officers may advance in two ways: first, up to the rank of lieutenant-colonel by substantive or regimental rank; second, up to colonel by obtaining rank in the army, generally called *brevet rank*, and above that by army rank through the several grades of general officers. In his regiment, the officer holds only his regimental rank, whatever his brevet rank may be; but among officers of the army generally he takes precedence according to his brevet rank. In describing an officer who has brevet rank, his regimental rank is placed first—as, Captain and Brevet-lieutenant-colonel Brown, which means that the officer named Brown, who holds rank in a regiment as captain, has for his services been promoted in the army to be lieutenant-colonel. Officers of the Foot-Guards have higher rank in the army. See FOOT-GUARDS. Another class of rank is *relative rank*, which attaches to certain offices. Thus, Captain Brown aforesaid, in addition to regimental rank as captain, and army rank as lieutenant-colonel, may possibly hold a staff appointment which confers on him the relative rank of colonel. *Local rank* is a common expedient for advancing comparatively junior officers to important duties, a higher rank than that properly held in the army being assigned to an individual within certain geographical limits, as in the East Indies, the Crimea, &c. *Temporary rank* is similarly limited by time, and is conferred usually for the period during which some appointment is

held, as the officer acting as Director of Ordnance ranks as major-general while so employed. *Honorary rank* carries neither duty nor emoluments; it is commonly given to the amount of one step to an officer who has served the time necessary for retirement; thus, a captain, after thirty years' service, may retire (on the pay of captain) with the honorary rank of major. Officers who have quitted the army are also allowed to retain as honorary the last rank they held.

Navy rank has no irregularities; it is plainly what it professes to be. The marines rank with corresponding grades in the army; and their and the army rank, as compared with the navy, will be shown under RELATIVE RANK (q. v.).

RANK AND FILE, the body of soldiers constituting the mass of the army, and including corporals, bombardiers, and privates. Rank and file means literally the lines of men from side to side, and from front to back—a rank being a row of men standing side by side, and a file of soldiers a line of men standing one behind another. The strength of a force is reckoned by its rank and file; the non-commissioned and commissioned officers forming the supernumerary ranks charged with the direction of the mass.

RANKÉ, LEOPOLD, one of the most distinguished modern historians of Germany, was born at Wiehe in Thuringia, 21st December 1795, and educated for a schoolmaster. In 1818, he was appointed Rector of the gymnasium at Frankfurt-on-the-Oder; and in 1824 published at Berlin his first work, *Geschichte der Roman. und German. Völkerschaften von 1494—1535*. It attracted considerable notice; and in the following year he was called to Berlin as Extraordinary Professor of History at the university, where his lectures soon began to be numerously attended. About this time, his attention was directed to the historical value of the reports sent home by the Venetian ambassadors at the different European courts during the 16th and 17th centuries, and the result of his studies and investigations among these was his *Fürsten und Völker von Südeuropa im 16 und 17 Jahrh.* (Berl. 1827), in which the affairs of Turkey and Spain are specially handled. Immediately after the publication of this work, he commenced a four years' tour through Europe, for the purpose of examining the archives of the different nations.

The fruit of his varied researches partly appeared in his *Serbische Revolution* (Berl. 1829), *Versuchung gegen Venedig im J. 1688* (Berl. 1831), and *Vorlesungen zur Geschichte der Ital. Poesie* (Berl. 1837); but a much greater and more valuable performance than any of these was *Die Röm. Päpste, ihre Kirche und ihr Staat im 16. und 17. Jahrh.* (3 vols., Berl. 1834—1836; 3d ed. Berl. 1844—1845), a work which, on account of its important conclusions regarding the character and policy of the papacy, many of which it may be said to have almost placed beyond controversy, was not only received with unbounded applause in Germany, but was translated again and again in Holland, England, France, and America, and may be regarded as one of the most widely-circulated and influential histories of modern times. It was followed up by his *Deutsche Geschichte im Zeitalter der Reformation* (6 vols. Berl. 1839—1847), considered in Germany his most finished and thorough production, and in the composition of which he was enabled to avail himself of many documents never before published or made use of. In a still higher degree than in his earlier writings, we find displayed here his skill in grouping events together in a vivid and intelligent manner, placing them before the eye of the reader in their whole significance, with all their causes, relations, and consequences. R.'s next effort, *Neun Bücher Preuss. Geschichten* (1847—1848), remodelled and re-issued in 1875 under the title *Genesis des Preussischen Staates*, may be regarded as continuing his history of Protestantism, and was worked up from the Prussian historical archives, opened to literature for the first time.

The stormy period of 1848 found him in the Frankfurt parliament; but he did not acquire any distinction in that arena of babbling and incompetent patriots, and soon betook himself again to more familiar and more valuable labors. His *Franz. Geschichte vornehmlich im 16 und 17 Jahrh.* (1852—57) is an admirable work, full of new information and enlightened views; and his *exposé* of the reign of Louis XIV. is put, even by French critics, on a level with that of Voltaire. Still later are his *Englische Geschichte vornehmlich im 16 und 17 Jahrh.* (1859—67, Eng. trans. 1875); *Die Deutschen Mächte und der Fürstenbund*; and his memoir of *Hardenberg* (1877). A collected ed. of his works was begun in 1874. R. became ordinary professor in 1834, and was ennobled in 1866. He has trained a numerous body of historical students.—R. has three brothers, FRIEDRICH HEINRICH RANKE (born 1797), KARL FRIEDRICH RANKE (born 1802), and ERNEST RANKE (born 1814), who have also risen to eminence as churchmen and scholars.

RANKING AND SALE is, in Scotch Law, an action whereby the land or heritable property of an insolvent person is sold, and the proceeds divided among the creditors. The main object is to sell the property in spite of the debtor, and have the proceeds

distributed among the creditors, for which purpose it is necessary to arrange or rank the creditors according to their respective legal priorities. The sale takes place in the Parliament House at Edinburgh, one of the macers acting as auctioneer. If no offerers appear, the sale is adjourned, and the upset price is lowered.

RANKNESS, an excessive luxuriance of growth in vegetables, a condition as unfavorable as its extreme opposite to their health and to the productiveness of crops. It is often caused by injudicious manuring, and is most frequent in moist seasons. The decay of mushrooms in pastures, as in Fairy Rings (q. v.), sometimes produces a rankness of grass which causes all animals to refuse it; such herbage abounding to an unusual degree in Chlorophyll (q. v.), but being very deficient in those qualities which render herbage most palatable and nutritious to cattle. Rankness in grain-crops is attended with a diminished production of grain, the flowers often proving abortive, and with a much increased liability to the attacks of parasitic fungi. In fruit-trees, it displays itself, even when the soil is only a little too rich, in a tendency to the production of shoots and foliage, instead of blossoms and fruit, and is to be counteracted by withholding manure, by root-pruning, or by cutting away portions of the bark. In wall-trees, deep cuts may even be made into the wood, although in standards this would involve a danger of destruction by the next storm.

RA'NNOCH, MOOR AND LOCH. The Moor, in the north-west extremity of Perthshire, with a mean elevation of about 1000 feet above the sea-level, is a wild waste, 28 miles long and 16 miles broad, and is one of the largest and most desolate and dreary moors in Scotland. Its surface is for the most part a broad, silent, and featureless tract of bog, heath, and rock, girdled by distant and gloomy mountains. In its western part is Loch Lydoch, which winds amid flat and dismal scenery. Stretching eastward from the Moor is Loch R., about 9 miles long by from 1 to 2 miles broad. It is surrounded by mountains, contains two islands, and is drained of its surplus waters by the Tummel, a tributary of the Tay.

RA'NSOM—corrupted from the Latin *redemptio*—is the price paid by a prisoner-of-war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare, the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors; but those for princes, or great nobles, to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I, for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and King John of France for £500,000, payable in instalments.—In modern warfare, where the fighting is performed by professional soldiers, pecuniary ransoms are scarcely ever resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

RA'NULA is a term applied to an encysted tumor, containing a glairy fluid, and lying under the tongue. The ordinary method of treating such tumors is by free incision or by cutting out a piece of the sac; and if this is not sufficient to effect a cure, the interior should be touched with nitrate of silver, or a small seton should be passed through it, with the view of destroying it by supuration. The name of the tumor is due to the supposed frog-like form which the swelling assumes.

RANUNCULA'CEÆ, a natural order of exogenous plants, mostly herbaceous, rarely shrubs, and generally natives of cold damp climates. Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species is about 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated sheathing stalks. The calyx is of 3–6 deciduous hypogynous sepals; the corolla of 3–15 hypogynous petals, in one or more rows, sometimes assuming very remarkable forms, as in larkspur, aconite, and columbine; rarely absent, in which case the sepals are gaily colored. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil; the ovary with one or more ovules. The fruit either consists of dry achena, or is berry-like or follicular.—Acridity is the prevailing character of the order, and the leaves of some species readily produce blisters; but this property disappears when they are dried or heated.

Many are narcotic and poisonous; some are used in medicine, as aconite and hellebore. The seeds of *Nigella sativa* were formerly used instead of pepper. The fruit of the May Apple or Wild Lemon (*Podophyllum peltatum*) of North America may be eaten, but is very acid.—Many of the order produce flowers of great beauty, as some species of *Ranunculus* (q. v.), *Anemone* (q. v.), *Larkspur* (q. v.), *Paony* (q. v.), *Columbine* (q. v.), *Olemais* (q. v.), &c.

RANU'NCULUS, a genus of plants of the natural order *Ranunculaceæ*; having five sepals; five petals, with a nectariferous pore at the base of each petal, often covered with a scale; many stamens situated on a receptacle, and germens accumulated into a

Garden Ranunculus.
(From a drawing by Holland.)

head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers, familiarly known as *Buttercups*; others, known by the name of *Crowfoot*, are troublesome weeds in gardens and pastures. Many, as the Spearworts, are found chiefly in moist places, and some are altogether aquatic, covering the surface of ditches, ponds, and rivers, where the water is shallow, with a carpet of verdure exquisitely studded with beautiful white flowers.—One species, the **ASIATIC R.**, or **GARDEN R.**, exclusively the R. of florists, a native of the Levant, has been cultivated in Europe for almost 300 years. From clusters of small tubers it sends up several bipartite leaves, and an erect branched stem, with terminal flowers, which, in the cultivated varieties, are often double or semi-double, yellow, white, red of various shades, or of mixed colors, very brilliant, and from an inch and a half to two inches and a half in diameter. The cultivated varieties are extremely numerous. The R. is propagated by seed, by offset tubers, or by dividing the clusters of tubers. The roots are often taken up in summer, after the leaves die, and kept in a dry place till the beginning of the ensuing winter or spring. Protection by frames and glasses, shading from strong sunshine, and other such means, are employed in order to increase the beauty of the flowers.

The R. loves a free and rich soil.—Double-flowered varieties of some other species, with taller stems and smaller white or yellow flowers, are cultivated in flower-gardens, sometimes under the name of *Bachelors' Buttons*.—The acridity of many species of R. is such that the leaves, bruised and applied to the skin, produce blisters; and those of *R. sceleratus*, a pretty common British species, are said to be used by beggars to cause sores, in order to move compassion. *R. thora*, a Swiss species, is of extreme acridity, and hunters were accustomed, in former times, to poison darts and arrows with its juice. Water distilled from the leaves of *R. flammula*, a British species, with rather tall stem and ovato-lanceolate leaves, common by the sides of ditches, &c., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning.—Yet the leaves of *R. ficaria*—sometimes called *Philewort* and *Lesser Celandine*, a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pastures in which *R. acris*, *R. repens*, &c., are very abundant, are injured by them, and they ought to be diligently grubbed out; they are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage, is even advantageous, and that they may act as a condiment. Their acridity is lost in drying, and they are not injurious to hay. The small tubers of *Philewort*, or *Lesser Celandine*, are used for the cure of hæmorrhoids; but their acridity also disappears when they are boiled, and they are then a pleasant article of food.

RANZ DES VACHES (in German, *Kuhreigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on an instrument called the *Alphorn*, consisting of a wooden tube somewhat bent, about three feet long, widened out into a bell, and bound by a pitched cord. The associations of pastoral life recalled by these airs to the Swiss in foreign countries, have been said to produce that unaccountable longing for home, or *nostalgia*, which has been remarked among the Swiss soldiers abroad. The bands of the Swiss regiments in foreign service have, on this account, to be prohibited from playing the Ranz des Vaches. The Emmenthal, Entlebuch, the Bernese Oberland, the Grisons, Appenzell, and other pastoral districts of Switzerland, have each their respective Ranz des Vaches. A collection of Ranz des Vaches, along with other Swiss melodies (*Sammlung von Schweizer Kuhreigen und Volksliedern*), was published at Bern in 1818; and these airs are also to be found in the *Allgemeines Schweizer Liederbuch*, 1851. The Ranz des Vaches of Switzerland are ruder in their character than the mountain melodies of the Tyrol, with which they are sometimes confounded.

RAPA'LLO, a maritime town of Northern Italy, province of Genoa, and 17 miles east of the city of that name, with 5350 inhabitants. It was first called Tigulia. Its only object of interest is the Sanctuary of the Madonna, on the Monte Allegro, erected in 1557. R. is a thriving commercial town, and has manufactures of wax and of soap, and of laces in thread and in cotton; it has fisheries of coral and tunny.

RAPE, or **COLESEED** (*Brassica napus*; see **BRASSICA**), a biennial plant much cultivated both on account of its herbage and its oil-producing seeds. It is a native of Europe, and perhaps of England; but it is hard to say where it is truly indigenous and where naturalized. It is so nearly allied to *Brassica rapa* (Turnip), *B. campestris* (Swedish Turnip, Colza, &c.), *B. oleracea* (Kale, Cabbage, &c.), and *B. praecox* (Summer Rape), that botanical distinction is difficult, particularly as to some of the cultivated varieties. Dr. Lindley gives the following synoptical view of the most characteristic differences of these species, in Morton's *Cyclopedia of Agriculture*:

Leaves bright green.....	<i>B. rapa</i> .
Leaves glaucous—	
Leaves hispid when young.....	<i>B. campestris</i> .
Leaves never hispid—	
Siliques spreading.....	<i>B. napus</i> .
Siliques erect—	
Calyx erect.....	<i>B. oleracea</i> .
Calyx spreading.....	<i>B. praecox</i> .

The root of R. is slender, or in cultivation sometimes becomes carrot-shaped (see **NAVEW**), but it never becomes turnip-shaped. The stem is taller than that of the turnip, or Swedish turnip, and the foliage more luxuriant. The cultivation of R. is very general in many parts of the continent of Europe, from which it

Rape (*Brassica napus*):
a, silique.

seems to have been introduced into England at least as early as the 16th c.; and in the 17th c., if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the continent, it is not unusual to sow R. in order to *green-manuring*, ploughing its herbage into the soil, a mode of enriching land much more common in some parts of Europe than it is in Britain.

R. delights in a rich alluvial soil, and is particularly suitable for newly reclaimed bogs and fens, in which the turnip does not

succeed well; but it is also extensively cultivated in the chalk and oolite districts of the south of England. The mode of cultivation does not differ much from that of turnip, and similar manures are used. In rich soils, R. sometimes attains a height of three or even four feet, so that the sheep turned in are hidden beneath the leaves, and seem to eat their way into the field. They eat the stalks even more greedily than the leaves. A too exclusive feeding on R. is, however, apt to produce diseases, which a sprinkling of salt, a supply of hay, &c., are found useful in preventing. When R. is cultivated for seed, it is sown in autumn. When the seed is ripe, R. is cut with the sickle; and after a short time allowed for drying, the seed is thrashed out, when the haulm is often burned, a wasteful practice, as its decay affords more abundant and useful manure, and indeed cattle are fond of it as food. *Rape-cake*, the mass of seeds from which oil has been obtained by crushing, is used for feeding oxen and sheep, but is very inferior to linseed-cake, and some other kinds of oil-cake. Ground into dust, it is a very valuable manure. *Rape-oil* is extensively used for machinery and for lamps; but the oil and cake so called are not exclusively obtained from this plant, nor are the names *Colza-oil* and *Rape-oil* used to discriminate the produce of different plants, although in some parts of Europe the name Colza is given to varieties of *Brassica campestris* and *B. oleracea*, which are cultivated in the same way as rape. *B. praecox* is also cultivated in some places, being sown in spring, and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names. See **OILS**.—The name *Rape* is from the same root as *Ger. repa*, and *Lat. rapa* (a turnip); *Cole-seed* and *Colza* from the same as *kale*.

RAPE is the crime of having carnal knowledge of a woman against her consent and by force. The essence of the offence is that force be used, and it is immaterial what is the age of the woman, and whether she is single or married, chaste or unchaste. The only difference caused by the habitual unchastity of the woman is that in such a case it is less easy to satisfy the jury that the element of consent was wanting. The two elements of rape are the carnal knowledge and the force used. As to the element of resistance on the part of the woman, or force on the part of the man, several niceties often occur in the application of the law, from the great variety of circumstances attending this crime. With regard to an idiot woman, it has been held that it is not necessary to prove resistance on her part, and that the crime may be committed though she made no resistance. If consent be extorted by fear and threats, or where several men join together, and resistance is useless, this is the same as using violence to overpower the woman. Where the woman is stupefied by drink, so that the power of resistance is annihilated, it is the same as knocking her down. In a case, however, where force is used in the first instance, but the woman afterwards in some degree consents, the crime of rape will not be committed, though the evidence may establish the crime of assault. Some difficult cases have occurred with reference to married women who have been beguiled by men personating their husbands, and so been in a certain sense, cheated out of their consent. But it has been repeatedly decided by a majority of the court, both in England and Scotland, that such an offence was not rape.

One of the important circumstances attending the crime of rape is the mode of proof, and in this respect it differs from other crimes. It is held to be all but essential, as a corroboration of the woman's story, that if her cries of resistance were not heard, at all events she should have, immediately after the offence, complained on the first opportunity to her friends or relations. It is not allowed to give in evidence the particulars of such complaint, but merely the fact that she made a complaint against some person. Unless this important particular be proved, her evidence is looked upon with great suspicion, and may be discredited by the jury, unless there were peculiar circumstances to account for the want of such complaint. One of the common defences to a charge of rape is the unchastity of the woman, the object being to render it unlikely that she did not consent, and hence it is in practice considered a proper question for the prisoner's counsel to put to her, whether she had not had connection with the prisoner before or with other men; but at the same time she is cautioned by the judge that she is not bound to answer such questions unless she likes. If, however, she denies the accusation, witnesses may be called to contradict her on that point.

The crime of rape is felony by the law of England, and is punishable by penal servitude for life, or for not less than three years, or by imprisonment not exceeding two years, with or without hard labor. Of late, attempts have been made to add flogging or corporal punishment to the other punishment, but bills having that object have been thrown out of parliament. There are several other crimes in the same category as rape, but punishable under separate enactments. Thus, the crime of having carnal connection with a girl under the age of ten years is felony, and punish-

able like rape. Whoever has carnal connection with a girl who is between the age of ten and twelve years, is guilty of a misdemeanor, and liable to penal servitude for three years, or imprisonment for two years with hard labor. Consent of the girl in these two cases is immaterial. The forcible abduction of women is divided into two offences. Wherever a woman of any age has property, and is forcibly taken away with intent to marry or carnally know her, the offence is felony punishable by penal servitude of three to fourteen years, or two years' imprisonment. Again, if a girl, though having no property, is under the age of twenty-one, and is fraudulently allured or taken away out of the possession of her parents or guardians, with intent to marry or carnally know her, this is felony, punishable as in the preceding case. In order to the commission of the latter offence, an improper motive is necessary on the part of the man, but the consent of the girl is of no consequence.

RAPHAEL, or RAFFAELLO SANTI or SANZIO, called by his countrymen *Il Divino*, 'the Divine,' is ranked by almost universal opinion as the greatest of painters. He was born at Urbino in 1483, and in 1497, on the death of his father, Giovanni Santi, who was his first instructor, he was placed under Pietro Perugino, the most distinguished painter of the period, who was then engaged on important works in the city of Perugia. In 1504, R. visited Florence, and improved his style by studying composition and expression in the works of Masaccio, and color and effect in those of Fra Bartolomeo. He seems to have lived in Florence till 1508, when he went to Rome, on the invitation of Pope Julius II. His celebrated frescoes in the Vatican and numerous important works were then commenced. Julius died in 1513; but his successor, Leo X., continued R.'s services, and kept his great powers constantly in exercise. The works of R. are generally divided into three classes: his first style, when under the influence of Perugino's manner; his second, when he painted in Florence from 1504 to 1508; and his third style, which is distinguishable in the works executed by him after he settled in Rome. Each of these styles has its devoted admirers. Those who incline to art employed in the service of religion, prefer the first manner, as embodying purity and religious feeling. His last manner, perfected when the taste for classical learning and art was strongly excited by the discovery of numerous valuable works of the classic period, is held by many connoisseurs as correctly embodying the highest art; while his middle or Florentine style is admired by some as exemplifying his powers, freed from what they deem the rigid manner of Perugino, and untainted by the conventionalism of classic art. In all these different styles, he has left works of great excellence. 'The Coronation of the Virgin,' in the gallery of the Vatican, and 'The Sposalizio,' or Marriage of the Virgin, in the Brera Gallery at Milan, belong to the first period. The 'St. Catherine,' in the National Gallery, London; 'The Entombment,' in the Borghese Gallery, Rome; 'La Bella Jardinière,' in the Louvre, to his second period. While the 'St. Cecilia,' at Bologna; the 'Madonna di San Sisto,' at Dresden; 'The Cartoons,' at Hampton Court; 'The Transfiguration,' and all the Vatican frescoes, except 'Theology, or the Dispute on the Sacrament,' the first he executed on his arrival from Florence, are in his third manner, or that which peculiarly marks the Roman school in its highest development. R. died at Rome on April 6, 1520, the anniversary of his birthday.

RAPHA NIA, or ERGOTISM, is a disease which was much more prevalent some centuries ago than it is at present. It is defined as 'a train of morbid symptoms, produced by the slow and cumulative action of a specific poison peculiar to wheat and rye, and which gives rise to convulsions, gangrene of the extremities, and death' (Aitken's *Science and Practice of Medicine*, 1858, p. 332). It has been described under various names. From the 10th to the 14th c., it was known as *St. Anthony's Fire*, a title which has been since associated with erysipelas. It was then described as epidemic gangrene. The name *Raphania* was first given to it by Linné, who thought the morbid symptoms were dependent upon the mixture of *Raphanus Raphanistrum*, or jointed charlock, with the wheat used as food. It was suspected, as early as the end of the 16th c., that the disease was due to the development of a fungus on the grain, and this fact is now established beyond doubt, although some writers hold (like Linné) that this morbid state is also produced by the admixture of poisonous plants, especially *Lolium temulentum*, or darnel, being mingled with the grain. Although rye is the ordinary seat of the poisonous fungus, wheat, rice, and other grains are liable to be similarly affected, and to produce similar results. For an account of the fungus, see ERGOT.

There are two forms of the disease—the spasmodic and the gangrenous. The spasmodic form begins with tingling or itching of the feet and hands, and sometimes of the head. Violent contractions of the hands and feet, giving rise to intense pain in the joints, are a common symptom. The head is much affected, the patient complaining of drowsiness, giddiness, and indistinct vision.

If coma or epileptic convulsions supervene, there is little hope of recovery. The appetite is usually enormous; spots like those of purpura appear on the face, and there are seldom any signs of improvement for some weeks. The gangrenous form begins with extreme lassitude, and is accompanied by some febrile disturbance. The extremities are painful, cold, almost insensible, and not readily moved; and after a varying time, gangrene supervenes.

With regard to treatment, the first thing to do is to replace the poisonous flour by easily digested, nourishing, wholesome food. The pain must be relieved by opiates, the blood purified by the administration of chlorate of potash, and the general tone of the system improved by tonics, such as the preparations of iron, bark, &c. In the spasmodic form, warm baths and gentle friction would probably prove serviceable. Whatever be the form of treatment adopted, the mortality in the gangrenous form is usually 90 per cent. The spasmodic form is much less destructive to life.

RA'PHIDÈS are crystals found in the interior of the cells of plants. The word is the plural of the Greek *raphis*, a needle, and was originally used to denominate crystals of an acicular form, which are often collected together in bundles. But crystals of various forms are found in the cells of plants, consisting chiefly of phosphate or of oxalate of lime. In many kinds of plants, they very much abound, and often in a particular manner in particular parts of plants. They are very minute, and are found in such delicate tissues as the petals of the Pelargonium.

RA'PIDAN. See RAPAHANNOCK.

RA'PIER is said to have had distinct meanings at different times, and in ancient fencing to have been a long cutting broadsword; but for the last century at least, the rapier has been a light, highly-tempered, edgeless, thrusting weapon, finely pointed, and about 3 feet in length. It was for long the favorite weapon in duelling, and was worn by every gentleman. At present, it is worn only on occasions of court ceremonial, and answers no other purpose than to incommode the wearer. In war, a rapier could never have been of any service.

RAPIN DE THOYRAS, PAUL DE, a French historian of England, was descended from a Protestant Savoyard family, which settled in France in the 16th c., and was born at Castres, in Languedoc, March 25, 1661. He studied at the Protestant college of Saumur, and passed as advocate in 1679, but had no liking for the profession; and when the Edict of Nantes (1685) forced him to leave France, he sought employment first in England (where he was unsuccessful), and afterwards in Holland, where he enlisted in a corps of volunteers at Utrecht, formed by his cousin-german, Daniel de Rapin. With his company, he followed the Prince of Orange to England in 1688, was made ensign in the following year, and distinguished himself by his bravery at the siege of Carrickfergus, the battle of the Boyne, and the siege of Limerick, where he was shot through the shoulder by a musket-ball. In 1693, he was appointed tutor to the Earl of Portland's son, with whom he traveled in Holland, Germany, and Italy, after which he took up his residence at the Hague; but in 1707, withdrew with his family to Wesel, in the duchy of Cleves, where he devoted the remaining 17 years of his life to the composition of his great work. The severity of his labors is believed to have shortened his days. He died May 16, 1725. R.'s *Histoire d'Angleterre* was published at the Hague in 8 vols., the year before his death. It was undoubtedly, as Voltaire has said, the best work on English history that had until then appeared: full, minute, careful in citing authorities, clear, rapid and accurate in narration, methodical in the arrangement of its materials, comparatively impartial in spirit, and yet betraying on the part of the author an honorable reverence for law and liberty. R. begins with the invasion of Britain by the Romans, and ends with the death of Charles I. The work was continued to the death of William III. by David Durant (Hague, 2 vols., 1734). The best edition of the *Histoire* in its augmented form is by Lefebvre de Saint-Marc (Hague, 16 vols., 1749 et seq.). The original was translated into English by the Rev. Nicholas Tindal, M.A. (Lond. 15 vols., 1725—1731), and subsequently by John Kelly, barrister (in 2 vols. fol.).

RAPP, JEAN, Count, a French general, was born at Colmar, in the department of Haut-Rhin, France, 27th April 1773. He was intended for the church, but his taste for a military life led him to enrol himself (1788) in the mounted 'chasseurs' of the French army. R. distinguished himself by dashing gallantry in Germany and Egypt, and on the death of Desaix at Marengo, he became aide-de-camp to Napoleon. His brilliant charge at Austerlitz upon the Russian Imperial Guard, which put the latter to a complete rout, was rewarded with the grade of general of division (24th December 1805). But R. joined to the utmost bravery and coolness, a quick and unerring judgment, which enabled him not only fully to comprehend Napoleon's plans, and execute to the spirit the duties intrusted to him, but also at times to amend and

even disobey his orders with the happiest results. The latter was the case at Lobau, where R.'s disobedience decided the battle in favor of Napoleon; and for this service, he was named a Count of the Empire (1st August 1809). He opposed the Russian expedition with the utmost earnestness, but, notwithstanding, accompanied the Emperor throughout the whole of it, adding on many occasions to his own reputation and the glory of the French arms. His obstinate defence of Danzig for nearly a year against a powerful Russian army, placed him in a high position among military men; and his chivalrous and considerate treatment of the unfortunate inhabitants during the siege was so warmly appreciated by them, that they presented him with a magnificent sword enriched with diamonds. The Russians, contrary to the articles of capitulation, sent R. and his garrison prisoners to Russia, and he did not return to France till July 1814. On reaching Paris, he was well received by Louis XVIII.; and in March 1815 was one of those appointed to oppose the return of Napoleon, but deserted, along with his troops, to his old master, and was appointed commander-in-chief of the army of the Rhine (16th April), and peer of France (2d June). After Waterloo, R. again submitted to Louis, but retired to Switzerland for two years, returning in 1817, and receiving a full pardon in the following year. He was re-created a peer of France (5th March 1819), and held various offices about the court; but broken in health by constant hard service and numerous severe wounds, he died at Paris, 8th November 1821. A volume of Memoirs (1823, in 8vo) has been published under his name.

RAPPAHANNOCK, a river of Virginia, formed by the union of the North fork and the Rapidan, which rise in the Blue Ridge of the Alleghany Mountains, and flow eastwardly to their point of union, 40 miles above Fredericksburg, where the falls afford water-power. The river is navigable from this point south-east to Chesapeake Bay, which it enters by a broad estuary, 70 miles long. The R. and the Rapidan were the scenes of some of the most sanguinary battles of the War of Secession, at Fredericksburg, Chancellorsville, and the Wilderness.

RAPPAREE, a wild Irish plunderer, so called from his being generally armed with a *rapary*, or half-pike. The term was in common use in the 17th century. See *Notes and Queries*, August 17, 1861.

RAPPEE, a coarse-grained species of **SNUFF** (q. v.). The word is of French derivation, and arose from this species of snuff being manufactured from dried tobacco by means of the *rappe* or *raspe*, an instrument by which the thin parts of the leaf were cut from the veins and fibres, the latter alone being used in the manufacture of rappee.

RA'PPEN, a small Swiss coin, made of an alloy of copper and tin, forming the $\frac{1}{100}$ th part of the modern Franc (q. v.), and therefore equivalent to the French centime. The old Swiss franc (= about 1s. 2d. sterling) was also divided into 100 rappen. The rappen was first coined at Freiburg, and took its name from the head of a raven (Ger. *rabe*, pronounced in some parts *rape*) impressed upon it.

RAPTO'RES. See **ACCIPITRES**.

RARATON'GA. See **COOK ISLANDS**.

RAS (= Heb. *rosh*), an Arabic word, signifying 'head,' 'promontory,' occurs in the names of many capes on the Arabian and North African coasts, and also in Sicily and Malta; as Rasi-elbi (corrupted from Rasi-calbo) 'the dog's cape,' on the north coast of Sicily; Ras-el-Abyad, 'white cape,' on the coast of Palestine; Ras Bab-el-Mandeb, 'cape of the gate of tears,' at the Strait of Bab-el-Mandeb; Ras-el-Jezriah, 'cape of the peninsula; Ras-el-Had, the eastern point of Arabia.

RASHES, affections of the skin, characterized by a red superficial efflorescence, diffused or in patches, disappearing under pressure, and usually ending in desquamation. To this division of cutaneous disorders belong Rubella (or Measles), Scarlatina (or Scarlet Fever), Erysipelas (or St. Anthony's Fire), Erythema, Roseola (or Scarlet Rash), and Urticaria (or Nettle Rash). Of these rashes, Rubella, Scarlatina, and Erysipelas are rather to be regarded as fevers or blood diseases, than as cutaneous diseases, in the true sense of the word.

RASHI (i. e., Rabbi Solomon [Shelomo] Izaaki, or Ben Izaak, often erroneously called Jarchi), the greatest Jewish commentator and exegete, was born about 1040, in Troyes, in France. The range of his studies was as extraordinarily wide as were his early developed faculties brilliant, and his industry and perseverance enormous. Philology, philosophy, medicine, astronomy, civil and canonical law, exegesis, were the chief branches of his learning; and to a rare proficiency in them, he united a complete mastery over the whole range of Scripture and the Talmudical sources. In order further to perfect himself for his gigantic task he traveled for seven years, visiting the academies of Italy, Greece, Germany, Palestine, Egypt, where he sat at the feet of

the great masters of the age, collecting their sayings and legal decisions. His chief work—and one universally recognized as the principal work of all Scriptural exegesis—is his Commentary to the whole of the Old Testament. Up to this day, it has not been superseded by any other, although in the province of philology and antiquities, investigation has been much furthered since his time. R.'s style is extremely brief and concise, yet clear and pregnant; obscure and abstruse (as it has been pronounced by some) only to those who lack the necessary preliminary knowledge.

According to the fashion of its day, it is replete with allegorical or rather poetical illustrations, gathered from the wide fields of the Midrash within and without the Talmud; and many a passage is thus preserved to us, which, in the disordered state of those manuscripts, would probably otherwise have been lost. This Commentary—entirely transplanted into Latin by Breithaupt, and partly also into German—was the first book ever printed in Hebrew (Reggio, 1474), and has since been reprinted with almost every complete edition of the Hebrew Bible. Of his numerous other works is first to be mentioned his Commentary to 23 treatises of the Talmud, supplemented after his death by his grandson, Samuel ben Meier; further, a Commentary to the Pirke Aboth; the *Pardes*, treating of Laws and Ceremonies; a Collection of Legal Votes and Decisions; a Commentary to Midrash Rabbah; a Book of Medicine; a Poem on the Unity of God, &c., &c. He died about 1105; and such was his piety and surpassing eminence, that later generations wove a shining garland of legends around his head. The confusion of R. with two Jarchis, who lived long after him, has not hitherto been properly accounted for. They bore that surname because they were born at Lunel, Jerach being the Hebrew for moon, *Lune* in French.

RASK, **RASMUS CHRISTIAN**, a distinguished Danish philologist, was born at Brendekilde, near Odense, in the island of Fünen, 22d November 1787, studied at Copenhagen, and in 1808 published his first work, *Vejledning til det Islandske eller gamle nordiske Sprog* (Rules of the Icelandic Language or the Ancient Language of the North). During the years 1807—1812, he occupied himself with drawing up grammatical systems for most of the Germanic, Slavic, and Romanic tongues, and in comparing them with those of India. He then visited Sweden, where he commenced to study Finnish; and in 1813 proceeded to Iceland, where he lived for two or three years, perfecting his knowledge of the language, the history, and the sagas of the inhabitants. On his return to Copenhagen, he was appointed sub-librarian to the university; and in 1818 published a splendid work, *Undersøegelse om det gamle nordiske eller Islandske Sprogs Oprindelse* (Researches concerning the Origin of the Icelandic or Ancient Language of the North), which led Grimm to his famous discovery of the displacement of consonants in the Teutonic languages.

Previous to this, however, he had resolved to visit Asia; and after spending a year (1817) in Stockholm, where he published his admirable *Angelsaksisk Sproglaere* (Anglo-Saxon Grammar), and the first critical and complete edition of the two great monuments of Scandinavian mythology, the *Snorra Edda* and the *Edda Saemundar*, he went to St. Petersburg, where he devoted himself for two years, with intense eagerness, to the study of the oriental languages, principally Sanscrit, Persian, and Arabic, but not failing to acquire, at the same time, a competent knowledge of Russian and Finnish. Thus equipped, he proceeded to Astrakhan, where he stayed six weeks, to study the language of the Tartars, and then commenced a journey through the country of the Turkomans, the Caucasus, Persia (where he added the Mongol and Manchou dialects to his already enormous linguistic acquisitions), Hindustan (cultivating in the last-mentioned country the society of learned Brahmans, and visiting all their great schools), and finally Ceylon, where he made himself acquainted with Cingalese and Pali, and wrote his *Singalesisk Skriftlaere* (Colombo 1822). In 1823, R. returned to Copenhagen, laden with learning and rare manuscript treasures, of which the greatest part was presented to the university. In 1825, he was appointed Professor of 'Literary History,' and in 1828, of Oriental Languages. Next year, he was made chief custodian of the university library; and in 1831, Professor of Icelandic. But his immense labors had exhausted his energies, and he died 14th November 1832, at the early age of 45, a victim of hard work. Besides the productions already mentioned, R. wrote *Frisisk Sproglaere* (Cop. 1825); *Den gamle Aegyptiske Tidsregning* (The Ancient Egyptian Chronology, 1827); *Denaeldste Hebraiske Tidsregning* (The Oldest Hebrew Chronology, 1828); besides grammars of several languages, and a great number of miscellaneous articles in the learned journals of the North, which were collected after his death, and published (Cop. 3 vols. 1834—1838), together with a life by Petersen.

RASKO'LNK (Russ. *separatist*), the name of a variety of sects in the Russian Church, which date from an early period, and must be regarded rather as a general designation of dissenters from the established church of Russia, than as a description of

any specific form of doctrinal belief. Such dissent is traceable from the very earliest period of the distinct organization of the Russian Church. A monk, named Andrew, in 1003; another, called Demitry (Demetrius), in the 12th c.; an Armenian monk, named Martin, who was burned as a heretic at Constantinople in the end of the same century; Leo, Bishop of Rostow in the beginning of the 14th, and Strigolnik and Nikita towards its close—are all mentioned as having originated or propagated heresies of various kinds. A still more remarkable and more formidable organization—a form of Crypto-Judaism—was introduced in the 15th c. by a concealed Jew, called Zacharias, who succeeded in gaining many followers. One of these, called Zosima, is particularly noticeable, as having obtained much popularity, and even managed to have himself elected metropolitan of Moscow. His sect, which studiously concealed itself wherever this concealment seemed necessary, was condemned by a synod (1490), and repressed with great rigor; but it continued to maintain a concealed and precarious footing, and is said to possess disciples even to this day, especially in the government of Irkutsk, under the name of Selesnewschtschina. A sect, whose leading principles were borrowed from the German reformers, was founded in 1553 by Matthias Baschkin; but it was condemned at a synod in Moscow, and does not appear to have taken much hold on the people.

But it is from the middle of the 17th c. that—the separation of the sects from the national church having become more tangible, from its involving nonconformity with the established worship—the designation of R. finds its fullest application. At that period, a complete revision of the ancient Slavonic liturgical and ritual books, which had suffered grievously from the ignorance, and probably also from the heterodoxy of transcribers, was undertaken by the Patriarch Nikon. See PHILIPPINS. The revised books were introduced into the churches by the authority of the czar as well as of the patriarch; but many of the clergy and people resisted the innovation, and refused the new liturgies. Foremost among the recusants, or non-conformists, were those who had already been sectaries upon other grounds; but all differences were to some extent merged in this common ground of protest, and all were known under the common appellation Raskolniks.

In later Russian history, the Raskolniks are sometimes called by the name, which they themselves affect, of Starowierzi ('Men of the Old Faith'), or Prawaslawniye ('orthodox'). Each sect has its specific doctrinal peculiarities; but most of them follow certain common observances, in which lies their tangible difference from the national church. They cross themselves with the first and middle finger, and not with the first three fingers; they use only the unrevised service-books; they repeat Halleluiahs only twice; in church ceremonies, they turn from left to right, and not from right to left; they use seven and not five altar-breads in the Eucharistic offering; they pay worship only to ancient pictures, or those painted by themselves; they use an eight-pointed instead of the ordinary cross; they attend only their own churches, and hold no communion of worship with the members of the national church; they never shave or cut their hair, and adhere strictly to the old Russian costume.

They may be divided, in general, into two classes—those which have popes (priests), and those who do not recognize the priestly order. The former are in every respect more moderate and more free from fanaticism than the Raskolniks who discard the ministry of priests. Their priests, however, have often been outcasts of the orthodox church, who betook themselves to the rival communion. The most notable among the Raskolniks of this class are those called the Peremasnowschina, who re-ordain all popes joining their communion; the Jewlewschtschina, who are said to permit freedom of divorce and exchange of wives; Dosithewschtschina, so called from their founder, a monk named Dositheus; and Tschernobolzi, whose chief distinction consists in refusing to take an oath, and to say the prayer for the emperor prescribed in the liturgy. Of the popeless Raskolniks, the chief are the Philippins (q. v.), the Pomorenians or Rebaptizers, the Theodosians—an offshoot of the Pomorenians—and a sect of mystic spiritualists with strong Protestant and rationalistic leanings, called Duchoborzen. A curious development of the R. movement is found in the Samokrischtschina (Self-baptizers) and the Samostrigolschtschina (Self-ordainers), among whom each one administers baptism to himself, each priest ordains himself, and each monk or nun performs the ceremony of their own consecration without the interposition of the regular ministry. It may be added, in conclusion, that with a considerable proportion of these various sectaries, there is found largely mixed up with religious fanaticism an element of communism and of disaffection towards the reigning dynasty, or, more properly, towards the established order of things. The latter may be in part explained by the rigorous measures of repression under which the Raskolniks have suffered for many successive generations. The former is an ordinary accompaniment of the sectarianism of the poor, and is especially frequent amongst sectaries of the present class.

RA'SPBERRY (*Rubus Idæus*), the most valued of all the species of *Rubus* (q. v.). It has pinnate leaves, with 5 or 3 leaflets, which are white and very downy beneath, stems nearly erect, downy, and covered with very numerous small weak prickles; drooping flowers, and erect whitish petals as long as the calyx. The wild R. has scarlet fruit, and is found in thickets and woods throughout the whole of Europe and the north of Asia. It is common in Britain. The R. has long been in cultivation for its fruit. There are many cultivated varieties, with red, yellow,

Raspberry (*Rubus Idæus*).

and white fruit, much exceeding the wild kind in size. The stem in a wild state is 3–4 feet high; in cultivation, 6–8 feet or upwards. Some of the cultivated varieties are also more branching than is common in a wild state, the stem of the wild plant being simple or nearly so. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. Plantations of raspberries are most easily made by means of suckers. The R. loves a light rich soil, and is rather partial to a shady situation. The tall kinds are unsuitable in situations much exposed to winds, as the stems are easily broken. The rows are generally about 4 feet apart, the plants 8 to 4 feet apart in the rows. The young stems are thinned out to allow free access of air to those which are left. Stakes are often used to support the stems, or they are variously tied together. The fruit is used for dessert; for jams, jellies, &c.; for making or flavoring many kinds of sweetmeats; and mixed with brandy, wine, or vinegar, for the preparation of *R. Syrup*, *R. Vinegar*, &c. Different preparations of it are used in medicine in cases of fever, inflammation, &c. R. vinegar is a particularly grateful and cooling drink in fevers. Raspberries, fermented either alone or along with currants and cherries, yield a strong and very agreeable wine, from which a very powerful spirit can be made.—Some of the other species of *Rubus*, most nearly resembling the R., produce also agreeable fruits. *R. odoratus* is a highly ornamental shrub, a native of Canada and the northern states of America, is frequent in gardens both in Europe and America, but rarely produces its fruit in Britain.

RASPBERRY VINEGAR, a culinary preparation, consisting of raspberry juice, vinegar, and sugar. It is best made by putting carefully gathered and very ripe raspberries into jars, and when as full as they will hold of the fruit, fill up the jar with good vinegar; after eight or ten days, pour off the vinegar, and let the fruit drain for some hours. The mixture of vinegar and juice thus obtained is added to another quantity of fruit, and treated in the same way. This is sometimes repeated a third time, and then the liquid is gently boiled for about five minutes with its own weight of refined sugar. Added to water, it forms a most refreshing summer drink, and is a useful cooling drink in sickness.

RA'STADT, a town and fortress in Baden, stands on the river Murg, 3 miles from its junction with the Rhine, and 15 miles south-west of Karlsruhe. It is a station on the Baden Railway. Steel wares, weapons, and tobacco are manufactured. From 1725 to 1771, the town was the residence of the Markgrafs of Baden-Baden. From 1840 till 1866, the fortress of R. was occupied by the troops of the Germanic Confederation. R. is memorable for two congresses—the former in 1714, when a treaty of peace, which brought the war of the Spanish Succession to a close, was signed between Marshal Villars and Prince Eugene; and the latter in 1799. On the breaking up of the congress of 1799 without any definite result, the three French plenipotentiaries set out for Strasbourg on the evening of April 19; but they had scarcely got beyond the gates of R., when they were attacked by a number of Austrian hussars; two of the three were slain, and the third sabred, and left for dead in a ditch. The papers of the legation were carried off, but no further spoil was taken. This flagrant violation of the law of nations roused the indignation and horror not only of

France, but of all Europe. The instigator and conductor of the assault were never known. Pop. (1880) 12,356. R. is now officially spelt *Rastatt*.

RAT, the popular name of all the larger species of the genus *Mus*. See MOUSE. Two species are particularly deserving of notice, the only species found in Britain, or, indeed, in any part of Europe, and both very widely distributed over the world: the BLACK RAT (*M. rattus*) and the BROWN RAT (*M. decumanus*). Extremely abundant as these animals now are, their introduction

Black Rat (*Mus rattus*); Brown Rat (*Mus decumanus*).

into Europe—which, if at all through human agency, was unintentionally so—took place within recent times. Neither of them was known to the ancients. Both appear to be natives of the central parts of Asia, where other nearly allied species are also found. The black rat found its way to Europe about the beginning of the 16th c.; the brown rat first appeared at Astrakhan in the beginning of the 18th c., and reached Britain and the western countries of Europe about the middle of the century. The Jacobites of Britain were accustomed to delight themselves with the notion that it came with the House of Hanover, and chose to call it the *Hanoverian Rat*. It also received the name of *Norway Rat*, from a belief, unquestionably erroneous, that it was introduced from Norway, a country which it did not reach until long after it was fully established in Britain.

These two species are like one another, and very similar in their habits. The brown rat is the larger and more powerful of the two, and has waged war against the other with such success as to cause its total, or almost total, disappearance from many places where it was once very abundant; so that in many parts of Britain, where the black rat was once plentiful and troublesome, it would now be difficult, perhaps impossible, to obtain a single specimen. Rats, when pressed by hunger, do not scruple to devour the weaker even of their own kind. The extirpation of the black rat does not, however, always follow from the introduction of the brown rat, each probably finding situations more particularly suited to itself. In their native regions, they exist together; and in some parts of Europe the black rat is still the more plentiful of the two. Both infest ships, and are thus conveyed to the most distant parts of the world, some of them getting ashore at every port, and establishing new colonies, so that they are now common—and particularly the brown rat—almost wherever commerce extends.

The black rat is nearly seven inches and a half in length, exclusive of the tail, which is almost eight inches long. The brown rat attains a length of more than ten inches and a half, with a tail little more than eight inches long. Besides its larger size and comparative shortness of tail, it differs from the black rat in its smaller ears and less acute muzzle, as well as in its lighter color and shorter hair. The tails of both are covered with a multitude of rings of small scales.

Both species are extremely prolific, breeding at a very early age, several times in a year, and producing from 10 to 14 at a birth. The excessive increase of their number, where abundant food is to be found, and there are few enemies to interfere with them, is thus easily accounted for. They sometimes multiply amazingly in ships; and perhaps nowhere more than in the sewers of towns. But in the latter situation, they really render good service to the promotion of public health, acting as scavengers, and devouring animal and vegetable substances, the putrefaction of which would otherwise be productive of pestilence. Such, indeed, seems to be the great use of the rat in the economy of nature; and it is perhaps worthy of notice, that the visits of the plague to Western Europe and to Britain have ceased from the very time when rats became plentiful. The brown rat, inhabiting sewers, is generally larger, fiercer, and of coarser appearance than the same species in houses or barns. Rats are also often found inhabiting burrows in dry banks, near rivers, &c. They feed indiscriminately on almost any kind of animal or vegetable food; they make depredations in fields of grain and pulse, from which they often carry off large quantities to be stored in their holes; they

devour eggs; they kill poultry, partridges, &c.; they make most unwelcome visits to dairies and store-closets; and they multiply enormously in the vicinity of slaughter-houses and knackers' yards, which afford them great supplies of food. Their strong rodent teeth enable them to gnaw very hard substances, such as wood and ivory, either for food, or in order to make their way to more tempting viands.

They are creatures of no little intelligence. Many curious stories are told of the arts which they employ to attain desired objects, of the readiness with which they detect the approach of danger, and the skill with which they avoid it. Their sense of smell is very acute, and the professional rat-catcher is very careful that the smell of his hands shall not be perceived on the trap. They are very capable of being tamed, and have in some instances proved interesting pets.

The flesh of rats is eaten, but only by rude tribes, or when food is scarce. The skin is used for making a fine kind of glove-leather.

The name rat is often popularly given, not only to the species nearly allied to these, but to other species of the *Murida*, now ranked in different genera, some of which are noticed in other articles.

RAT, WATER. See VOLE.

RATAFIA, the generic name of a series of cordials, prepared usually by mixing an alcoholic liquor with the juice of some fruit or some flavoring material, and sugar or syrup. The name is of French origin, and is said to have been given in consequence of the former habit of preparing a choice drink to be used at the ceremony of *ratifying* a treaty. A favorite flavoring for ratafias is the almond—hence, bitter almonds, cherry, peach, apricot, plum, and other similar kernels, are much used, and hence small almond-flavored cakes are called ratafia cakes; but many other flavors are used, as orange flowers, gooseberries, raspberries, aniseed, angelica stalks; chocolate; black currants, coffee, &c.

RATCH, or RATCHET, in Machinery, is a small piece of metal, so placed with one end on a pivot, that the other can fall into the teeth of a wheel, as in the fig. Being perfectly free to move up and down, its own weight makes it drop into tooth after tooth as the wheel revolves. But, as will be seen from the peculiar shape of the teeth, which have the form of an inclined plane on one side, and a perpendicular face on the other, the wheel can only revolve in the direction of the arrow.

Ratch.

RATE, or ASSESSMENT, is a money payment levied upon the owners or occupiers of real property, in respect of some benefit to such property, or in discharge of some legal liability attaching to it. The power of rating proprietors or tenants of lands is a power not existing by the common law of England, except for the repair of the parish church or of the parish highways; for poor rates, county rates, &c., are all authorized by some statute or statutes. A rate is in the nature of a local tax, and therefore so far contrary to the law, that clear authority must always be shown for levying it. Hence, whenever a statute prescribes the conditions under which a rate may be imposed, it invariably states by whom the rate is to be made, and how it is to be enforced, and what appeal is to be allowed in case of an individual being aggrieved. These conditions must all be strictly complied with to the letter, otherwise the party rated can raise objections, and resist the rate. It may be said to be a general rule, that all rates must be so entitled that the parties rated are informed even by its heading whence the authority is derived. It is almost an invariable rule that the payment of rates is enforced in a summary way by justices of the peace, and this is one of the chief functions performed by justices. The mode in which this is practically done is by the party who has power to rate, or the agent or collector, applying to the justices for a summons, calling on the ratepayer to pay it. If payment is refused or neglected, application is next made for a distress-warrant to enforce payment, which means, if the payment is not made forthwith, or within a short specified time, the constable may seize the goods and chattels of the ratepayer, and sell them to make up the amount; and if there are no goods to seize, the party may be imprisoned for a specified time. As a general rule, imprisonment is only allowed after all means of recovering the rate by distress or seizure of the goods have failed. Owing to the strictness with which the machinery of rating must be carried on as directed by the statute, the ingenuity of the ratepayers, whetted by the natural indisposition of mankind to pay taxes, constantly prompts them to detect flaws in the proceedings, and litigation in various shapes is thereby produced throughout the country. As a new rate is almost invariably made every year, and sometimes every half year, constant opportunities for displaying this spirit of resistance are afforded.

RA'TEL (*Mellivora*), a genus of quadrupeds of the Bear family, *Ursidae*, nearly allied to the Gluttons (q. v.), from which it differs in having one false molar less in each jaw, and the upper tubercular teeth slightly developed. The general aspect is similar to that of the badgers, but heavier and more clumsy. Two species are known, one of which, the **CAPE R.** (*M. ratel* or *Capensis*), inhabits the south of Africa, and is said to feed much on bees and their honey, its thick fur protecting it against their stings; the

Ratel (*Mellivora ratel*).

other inhabits the north of India, prowls about by night, is a voracious devourer of animal food, and often scratches up recently interred bodies from their graves. The Cape R. is about the size of a badger; gray above, black below. It is easily tamed, and is amusingly active in confinement, continually running about its cage, and tumbling strange somersaults to attract the attention of spectators, from which it seems to derive great pleasure.

RATEL-ICOUM, a Turkish sweetmeat, which has become common in confectioner's shops under several names, but chiefly that of 'Lumps of Delight.' Its composition is starch and syrup, sometimes colored. It is imported in the form of small cakes, about an inch thick, and one or two inches square, and evidently cut from a mass. These pieces have been sprinkled with powdered white sugar, to prevent them from sticking together in the small boxes in which they are packed.

RA'THENAU, or **RATHENOW**, a town of Prussia, in the province of Brandenburg, on the right bank of the Havel (here crossed by a stone bridge), 45 miles west-north-west of Berlin. It consists of two portions, one old, and surrounded by walls, and the other new. Weaving, spinning, and brick and tile making are carried on, and there are three factories for making optical instruments. Pop. (1880) 11,394.

RATHKEA'LE, a market and post-town of the county of Limerick, Ireland, situated on the river Deel, 17 miles south-west of Limerick. R. is a place of some inland commerce, but possesses no manufactures of any note. It is remarkable as a chief center of the Palatine settlers introduced into Ireland soon after the close of the Jacobite war. Several of the families still remain in the district. The population in 1861 numbered 2761, and in 1881 had decreased to 2549.

RATHLI'N, ISLAND OF, an island $6\frac{1}{2}$ miles in length by $1\frac{1}{2}$ miles in breadth, in the barony of Carey, county of Antrim, Ireland, $6\frac{1}{2}$ miles distant from the coast at Ballycastle, lat. $54^{\circ} 36'$ N., long. $9^{\circ} 15'$ W., supposed to be the Ricinia of Ptolemy, and Ricinia of Pliny, and called variously by later writers Rathi, Raghlin, and Ragheren, or Ragh Erin, fortress of Ireland. R. has been known in history since the days of the first religious migrations of the Irish monks under Columba; it was the scene of more than one struggle in the Danish wars, and it afforded shelter, after his defeat in Scotland, to Robert Bruce. In 1558, the Scottish colony which then inhabited the island was attacked by the Lord-deputy Sussex, and expelled from the island with such slaughter, that in 1590 R. was said to be entirely uninhabited. The geological formation of R. is basalt with limestone, and on the east side the basalt takes a columnar form, similar to that of the Giant's Causeway on the Irish, and of Staffa on the Scottish shore. The soil is light, but in the sheltered valleys productive. Formerly, a considerable industry existed on the island in the manufacture of kelp; but since the cessation of that trade (see **KELP**) the population, which in 1841 amounted to 1039, had, after a lapse of 30 years, been reduced to less than half that number.

RA'TIBOR, a town of Prussia, in Upper Silesia, stands on the left bank of the Oder, 44 miles south-south-west of Oppeln. It is a growing town, and a station on the Breslau and Vienna Railway. Pop. (1880) 18,373, who are employed in the grain and timber trade and in the manufacture of tobacco.

RATIFICA'TION is a legal term used in the law of Scotland to denote the acknowledgment made by a married woman apart from her husband, and before a justice of the peace, that a deed executed by her is voluntary, and made with full knowledge of its legal effect. In this sense, the term corresponds to what is

technically called in England an acknowledgment by a married woman. With regard to minors, the term is also technically used to denote the kind of confirmation or approval given by a person arrived at majority to acts done by him during minority, and which has the effect of conclusively establishing the validity of the act, which would otherwise be voidable.

RATING OF MEN, in the Navy, signifies the grade in which the man is entered on the ship's books; as, rated a petty officer, rated an able seaman, &c.

RATINGS of ships are classifications by which certain allowances, the complement of officers, and other arrangements, are regulated. This rating is for merely official and administrative purposes, and gives no idea of the force of the ships. The classification at present is as follows: 1. Rated ships. *First-rates*—all ships carrying 110 guns and upwards, or 1000 men and upwards. *Second-rates*—one of the Queen's yachts; all ships above 80 guns and under 110, or with crews of from 800 to 999 men. *Third-rates*—the Queen's other yachts; vessels bearing the flag or pendant of any admiral-superintendent or captain-superintendent of the Royal Dockyards; all ships of 60 to 80 guns, or carrying 600 to 799 men. *Fourth-rates*—all frigate-built ships carrying from 410 to 600 men. *Fifth-rates*—all ships of from 300 to 400 men. *Sixth-rates*—all other ships bearing captains. 2. Sloops—comprising all vessels bearing commanders, and having the principal armament on one deck in broadside ports. 3. Gun-vessels—all vessels having commanders, and carrying their principal armament on one deck amidships. 4. All other ships and smaller vessels commanded by lieutenants.

RA'TIO. See **PROPORTION**.

RATION, in the Army and Navy, is the allowance of provisions granted to each officer, non-commissioned officer, soldier, or sailor. The army ration at home is $\frac{1}{2}$ lb. of meat, and 1 lb. of bread ('best seconds') if in barracks, or $\frac{1}{2}$ lb. of meat with $1\frac{1}{2}$ lb. of bread if in camp. If a grocery ration is also issued, $1\frac{1}{2}$ d. for each such ration is deducted from the pay of the recipient. When men are not supplied with rations, an allowance of 6d. per diem is granted. Abroad, the ration is 1 lb. of bread, or $\frac{1}{2}$ lb. of biscuit, and 1 lb. of fresh or salt meat, except at certain stations, where, for climatic reasons, a different ration is specially provided. The bread ration may be increased during operations in the field, though not above $1\frac{1}{2}$ lb. of bread or 1 lb. of biscuit. During active operations, the officer commanding may direct the issue, in addition to the above, of wine, spirits, or any other article of subsistence equivalent thereto. The stoppage for this foreign ration is 1d. The families of soldiers accompanying them abroad are allowed the following rations: the wife (married under regulation), half a ration; each legitimate child under 7, a quarter ration; from 7 to 14, a third part of a ration. When officers receive a colonial allowance in lieu of rations in kind, each is subjected to a daily stoppage of 2½d. A ration of forage at home consists of 10 lbs. of oats, 12 lbs. of hay, and 8 lbs. of straw for each horse. Cavalry soldiers receive this without stoppage; but their officers suffer a deduction of 8½d. per ration. Staff-officers and mounted officers of infantry provide their own forage, and are granted a pecuniary allowance of 1s. 10d. per day to enable them to do so.

The full navy ration consists of the following articles: Daily— $1\frac{1}{2}$ lb. of ship-biscuit, or $1\frac{1}{2}$ lb. of soft bread, $\frac{1}{4}$ pint of spirit, 2 oz. sugar, 1 oz. chocolate, $\frac{1}{2}$ oz. tea; 1 lb. fresh meat, and $\frac{1}{2}$ lb. of fresh vegetables, when these are procurable; otherwise, 1 lb. salt pork, with $\frac{1}{2}$ pint split peas, or 1 lb. of salt beef, with 9 oz. flour, $\frac{1}{2}$ oz. suet, and $1\frac{1}{2}$ oz. of currants or raisins. On alternate salt beef days—2 oz. preserved potatoes. Weekly— $\frac{1}{4}$ pint oatmeal, $\frac{1}{2}$ oz. mustard, $\frac{1}{2}$ oz. pepper, $\frac{1}{2}$ pint vinegar.

The sailor's ration is issued free of any stoppage.

RA'TIONALISM (Lat. *ratio*, reason) strictly signifies that method of thought which in matters of religion not only allows the use of reason, but considers it indispensable. The term has now, however, acquired a wider meaning, and stands in opposition to *Supranaturalism*, or the belief in that which either transcends, or, as others view it, contradicts, both nature and reason as, for example, miracles. To comprehend rightly the struggle between Rationalism and Supranaturalism, in modern Protestant theology, one must look at it from a historical point of view. The German and Swiss divines, in maintaining their polemic against Roman Catholicism (after the original enthusiasm of the Reformation had cooled down), took their stand on the absolute authority of the Bible as a purely divine book, containing no admixture of error of any kind, either in form or substance—the very vowel-points of the Hebrew (an innovation long posterior even to Christianity) being expressly held to be inspired. This, the oldest and most stringent kind of Protestant orthodoxy, gradually fell to pieces, partly on account of its unscientific character, and partly because it was demonstrated that the Bible itself put forth no pretensions to such infallibility. The first con-

cessions to Rationalism were the admissions that the biblical writers differed in regard to their style and literary merit; next (as a logical inference from the foregoing), that they exercised a certain amount of independent power in the composition of their works.

But gradually other points were assailed, some of which have been surrendered, while others are still tenaciously held, as that, in matters of physical science, the sacred writers spoke according to the conceptions and belief prevalent in their age, and not according to any supernatural enlightenment; that, on historical points, their information might be either erroneous or defective, or both; that they might err in anything except religious doctrine or sentiment; finally, that they might err in such too, and that the Bible is not the 'Word of God,' but only contains that 'Word,' which it is the province of human reason to discover, and to separate from whatever accretions of fable, myth, symbolism, or error have grown over it through the agency of man or the lapse of time. This is properly the theological Rationalism of modern times, and is held in Germany, France, Holland, England, and America by many divines, who, nevertheless, look upon themselves as essentially Christians in their creed. But as most investigators that proceed so far, take yet a further step, and deny the presence of any element other than human in the Bible, or that there is any satisfactory evidence of the truth of its alleged supernaturalism, the word Rationalism has, in vulgar parlance, come to be synonymous with infidelity. It may also be added that the term Rationalism is also employed in a restricted sense to denote the method of substituting for the miraculous and supernatural in Scripture, something considered reasonable—e. g., the miracle of the crossing of the Red Sea is explained by the hypothesis that the Israelites crossed when the tide was out, while Egyptians hurriedly pursuing them, were taken in the returning waters. The leader of this school was *Panlus* (q. v.), whose system after a time, gave way to the more scientific mythical theory of Strauss (q. v.).

RA'TIOS, PRIME AND ULTIMATE. There can be little doubt that Newton discovered by means of fluxions, of which he was in possession at a very early age, the greater part of that extraordinary series of theorems regarding motion, &c., which he first published in the *Principia*. He had, however, a great partiality for the synthetic form of demonstration, employed with such success by the Greek geometers; and the consequence was that, in the *Principia*, he avoided entirely the use of analysis by fluxions, and invented for synthetical applications, the closely allied method of Prime and Ultimate Ratios. The fundamental idea involved in fluxions, prime and ultimate ratios, and the differential calculus, is the same, that of a *Limit* (q. v.).

To give an idea of the nature, as well as to show the origin of the name, of the method, we may take a very simple case. Let a particle be projected in the direction AP; it will move uniformly in that line for ever, unless deflected from it by some external force. See **MOTION, LAWS OF**. Suppose that gravity alone acts upon it, then (see **PROJECTILES**) it will describe a parabolic path, AQ, to which AP is the tangent at A; and the line PQ, which joins the disturbed and undisturbed positions of the particle at

Fig. 1.

Fig. 2.

any instant, is vertical. Now, the lengths of AP and AQ are not, in general, equal, but they are more and more nearly equal as both are smaller; and, by taking each small enough, we may make the *percentage* of difference between them as small as we choose. In other words, their *prime ratio*, just at A, is unity. Again, the inscribed square is less than a circle; the octagon greater than the square, but less than the circle; the regular polygon of 16 sides greater than the octagon, but less than the circle; and so on, constantly doubling the number of sides. But it can be shown that the difference of area between the polygon and the circle may be made as small a percentage of the area of the circle as we please, by making the sides of the polygon numerous enough. Hence, the *ultimate ratio* of the areas of the circle, and inscribed polygon with an indefinitely great number of equal sides, is unity.

The basis of the method, which is implicitly involved in the foregoing illustrations, is Newton's *First Lemma*: 'Quantities, and the ratios of quantities, which tend constantly to equality, and may be made to approximate to each other by less than any assignable difference, become ultimately equal.' In other words,

if we can make the *percentage* of difference of two quantities as small as we choose, we must produce ultimate equality.

From this, in his second and third Lemmas, Newton proves the fundamental principle of the integral calculus as applied to the determination of the areas of curves, by showing that if a set of parallelograms, as in the figure, be inscribed in any curvilinear space, the percentage of difference between the sum of their areas and that of the curve may be made as small as we please by diminishing indefinitely the breadth of each parallelogram, and increasing their number proportionally.

Next, he shows how to compare two curvilinear spaces, by supposing them filled with such parallelograms, each of the first bearing to one of the second a constant ratio.

Next, that the homologous sides of similar *curvilinear* figures are proportional.

The sixth Lemma is merely a definition of continuous curvature in a curve, as distinguished from abrupt change of direction.

The seventh, eighth, and ninth Lemmas are of very great importance. The general principle involved in their proof is this—to examine what occurs in indefinitely small arcs, by drawing a magnified representation of them such as always to be on a finite scale, however small the arcs themselves may be. Thus, to show that the chord of a small arc is ultimately equal to the arc—of which we have in Trigonometry (q. v.) as a particular case, the ultimate equality of an arc and its sine—he proceeds somewhat as follows: Let AB be an arc of continued curvature, AC the tangent at A. Produce the chord AB till it has a *finite* length, Ab. Describe on Ab, as chord, an arc similar to AB. This, by a pre-

Fig. 3.

vious lemma, will touch AC at A. Now, as B moves up to A, let the same construction be perpetually made, then b will approximate more and more closely to AC (because the arc AB is one of continuous curvature), and the magnified arc will constantly lie between AC and Ab. Hence, ultimately, when Ab and AC coincide in direction, the arc Ab (which is always between them) will coincide with Ab. Similarly, AD being any line making a finite angle with AC, draw DBE cutting off a finite length from AD; this process enables us to prove that the triangles AED, and the rectilinear and curvilinear triangles ABD, are all ultimately equal.

Finally (and this is the step of the greatest importance in the dynamical applications), if the lines AD, DE, D'E' be drawn under the above restrictions, the ultimate ratio of the curvilinear or

Fig. 4.

rectilinear triangles AEB, AE'B' is that of the squares of corresponding sides. From this, in the ninth and last Lemma, it is easily shown that the spaces described under the action of a finite force have their prime ratios as the squares of the times; whence we pass at once to the ever-memorable investigation of the *Principia* regarding the orbits described under the action of various forces.

The method of prime and ultimate ratios is little used now (except in Cambridge, which does honor to itself in making part of the *Principia* a subject of study), as the differential and integral calculus help us to the required results with far greater ease. But to the true student of natural philosophy, the synthetic method of Newton is of very great value, as it shows him clearly at every step the nature of the process he is carrying out, which is too apt to be lost sight of entirely in the semi-mechanical procedures common to all forms of symbolical reasoning.

RA'TISBON. See REGENSBURG.

RA'TLINES, or RATLINGS, are steps in the ladders by which sailors ascend from the deck to the mast-heads. They consist of thin cords fastened horizontally across the shrouds at an easy step apart, thus forming a convenient ladder. To prevent the ratline slipping, it is commonly tied to the shroud in a peculiar knot commonly called a clove-hitch.

RAT-SNAKE (*Coryphodon Blumenbachii*), a serpent of the family *Colubridæ* (see *COLUMBER*), which is often kept in a state of domestication in Ceylon, on account of its usefulness in killing rats. Like the rest of its family, it is destitute of poison-fangs. It is capable of being rendered very tame, and displays considerable intelligence.

RAT-TAIL MAGGOT, the larva of a dipterous insect, *Eristalis tenax*, of the family *Muscidæ*. It inhabits mud, and breathes by means of tubes attached in telescope fashion to the tail, which terminates in a brush of hairs, and is always held up to the surface of the water, being elongated when the depth of water increases. The perfect insect is very like a bee.

RATTA'N, RATAN, or ROTTANG (*Calamus*), a genus of palms very different in habit from most of the order; having a reed-like, slender, often jointed, and extremely long stem, sometimes even 1000 feet or upwards in length. The name R. is extended to others of the same tribe of palms, having the same general habit, although constituted by botanists into different genera. The stem, which is very smooth, and hard and silicious externally, is either erect, or ascends and descends among trees; often laying hold as it ascends by means of hooked prickles, the extremities of the midribs of its leaves, which are scattered at considerable intervals along its whole length, and envelop it by their sheathing stalks, and then descending in graceful festoons to climb again a neighboring tree. Sometimes, however, there are no leaves scattered along the stem. Sir James E. Tennent says, in his work on Ceylon: 'I have seen a specimen 250 feet long, and an inch in diameter, without a single irregularity, and no appearance of foliage other than the bunch of feathery leaves at the extremity.' The leaves are always pinnate, and very beautiful. The fruit is a dry berry, covered with imbricated scales, and generally one-seeded.

The species are very numerous, all natives of the East Indies. A few species are found in the southern parts of India; but they abound along the southern foot of the Himalaya, in Chittagong, Silhet, Assam, the south-east of Asia, and many of the islands of that region. They are all very useful, are much employed in their native countries, for making plaited work, ropes, &c., and are very largely imported into Britain and other parts of the world, generally under the name of *Cane*, and chiefly in order to be used for plaited or wicker work.—Bridges of great strength are made, in some parts of the East, of the stems of these palms. They are twisted into ropes in some parts of the East, which are used for binding wild elephants, and for other purposes requiring great strength; the vessels of Java, Sumatra, and neighboring regions, are very generally furnished with cables made of them, which are extensively manufactured at Malacca; and the Chinese make ropes of rattans by splitting them longitudinally, soaking them, and attaching them to a wheel, which is kept in motion, whilst new rattans are added, one by one, to increase the length of the rope.—The species called *Calamus rudensium*, which has very long stems, is much employed in rope-making. Many species probably furnish the canes of commerce, one of which, *C. verus*, a native of India, is only about 20 feet in length.

The elegant walking-canes called *Malacca Canes* are believed to be the produce of *C. scipionum*; the plant, however, does not grow in Malacca, but in Sumatra.—Small stems of R. are used as a substitute for whalebone in umbrellas.—The fruit of some species of R. is a delicate article of food; and the young shoots, variously dressed, are equal to the finest of vegetables.—A very fine kind of *Dragon's Blood* (q. v.) is obtained from a species of R. (*C. Draco*), and particularly from the fruit, on the surface of which it appears as a resinous exudation. Various methods are employed for collecting it.

The canes of commerce are usually imported in bundles of 100 canes, each cane from 15 to 20 feet in length; from 200,000 to 300,000 of these bundles are annually imported into Britain.

RA'TTANY, or RHATANY (*Krameria triandra*), a half-shrubby plant of the natural order *Polygalæ*, a native of the cold sterile table-lands of the Andes in Peru and Bolivia. It is called *Ratanhia* in Peru. It is valued for the medicinal properties of the root, which are shared more or less by other species of the same genus, also natives of South America. The dried root is a powerful astringent, and a useful tonic; and is employed in mucous discharges, passive hæmorrhages, and cases of relaxation and debility. It is also used as a tooth-powder, often mixed with orris-root and charcoal. R. root is imported from different parts of South America, but chiefly from Lima. It is extensively imported into Portugal in order to communicate a rich red color to wines.

The peculiar properties of R. root are supposed to be chiefly owing to an acid called *Krameriac Acid*.

RATTAZZI, URBANO, an Italian statesman, was born in the middle ranks of life, at Alessandria (Piedmont), in 1810. He was an advocate at Casale, where, in 1847, he was President of the Agricultural Committee. After the proclamation of the constitution in 1848, he was elected member for Alessandria, and began his political career as a democrat. His knowledge, eloquence, and liberal principles raised him to the ministry, and his first act was to write to the bishops, threatening to have them arrested, if they should preach against liberty. He resisted his chief, Gioberti, who wished to send Piedmontese soldiers into Tuscany and Rome, to prevent the occupation of these places by the Austrians and French; urged Charles Albert into a new war with Austria, and after the defeat of Novara, was obliged to retire from the ministry. After Napoleon's *coup d'état*, the liberty of Piedmont was threatened, and Cavour, R., and their parties joined together to defend it. This union was called *convincio*. R. took the portfolio of Minister of Justice in the Cavour Ministry in 1854, and presented the bill for the abolition of convents. The priests were up in arms against him, and he was strenuously opposed by the Catholic party. After the Mazzinian movement in 1857, being accused of weakness in suppressing it, he retired. After the peace of Villafranca, he returned to the ministry. He did not wish to accept definitively the annexation of the Duchies, because he knew that the price of it was Savoy and Nice, which he was unwilling to give up; and being, as is alleged, secretly undermined by Cavour and Sir James Hudson, he fell. In 1862, R. was intrusted with the formation of a new ministry. His policy was an attempt to secure the development of Italian liberty and unity by peaceful and diplomatic means. He opposed Garibaldi's expedition against Rome in that year, so that its result was the disaster at Aspromonte. His ministry failed to secure the confidence of parliament, and he accordingly resigned at the end of the year 1863. He returned to office in 1867, but had to resign the same year. He died June 5, 1873.

RA'TTLESNAKE (*Crotalus*) a genus of serpents of the family *Crotalidæ*, distinguished from the rest of that family by the rattle at the end of the tail. They are also characterized by having only one row of plates under the tail. The genus is subdivided by many authors according to the scales and shields with which the head is covered in different species. All the species are American, and are much dreaded for their deadly venom, although they seldom assail man, unless molested, and the rattle often gives timely warning of danger. The R. is often found at rest in a coiled form, with the rattle somewhat erected from the center of the coil; and when it begins to be irritated, the rattle shakes. Rattlesnakes are generally rather sluggish in their movements, but they are most active and most dangerous in the warmest weather, their bite being more formidable at such a time as well as more readily inflicted. The effects of the bite are various, according not only to the condition of the serpent, but also according to the constitution of the person bitten, and the place into which the fangs have been inserted, the worst case being when the poison immediately enters a large vein, and so is carried at once to the most vital parts. Death to human beings has been known to ensue in a few minutes, whilst in other cases, hours or days have elapsed, and sometimes the sufferer recovers. Almost all animals show what may be deemed an instinctive dread of the R., and a great unwillingness to approach it. Hogs and peccaries, however, are so far from regarding it with dread, that they kill and eat it, finding safety from its venom probably not in any peculiarity of constitution, but in their thickness of skin, and the thickness of the layer of fat under the skin. Rattlesnakes are viviparous, and exhibit attachment to their young. It is said of them, as of the viper, that on the appearance of danger, the mother receives her young ones into her mouth and gullet, or stomach, ejecting them again uninjured when the danger is past, but the same doubt attaches to the story as in the case of the viper. The power of Fascination (q. v.) has not been more frequently ascribed to any kind of serpent.

The rattle is a very peculiar appendage. It consists of a number of thin horny cells, jointed together; each, except the terminal one, of a conical form, and in great part covered by that next to it, against the sides of which its apex strikes when the rattle is shaken, so as to produce a rustling or rattling noise. It is generally believed that the number of joints in the rattle increases with the age of the serpent, one being added at each casting of the skin. One species of R. (*Crotalus horridus*), sometimes called the CARCAVELA, is found in the warm parts both of North and South America. Its muzzle is covered by three or four pairs of plates. Its scales have a sharp elevated keel. It attains the length of eight feet, although it is seldom found of so great a size. Its color is yellowish-brown above, with a broad dark streak on each side of the neck, and a series of broad lozenge-shaped spots on the back.—Another species, *Crotalus* or *Tropophis*

durissus, extends further northward, as far as the southern shores of the great lakes. It is of a pale brown color, with a dark streak across the temples, and dark spots on the body, often assuming the form of bands; the keel of the scales not so strongly developed, and the muzzle with fewer shields than in the former

Rattlesnake (*Crotalus horridus*).

species, which it resembles in size. A third species, *Crotalus* or *Crotalophorus miliaris*, having the head completely covered with large shields, is also common in many parts of North America, and is as much dreaded as either of those already named, notwithstanding its much smaller size, because the sound of its rattle is so feeble as not readily to attract attention. It is of a brownish-olive color, with brown spots on the back and sides, the belly black.—In the colder countries which they inhabit, rattlesnakes spend the winter in a torpid state, retiring for that purpose into holes, or hiding themselves among moss.

RATZ BOSZORMENY. See BÖSZORMENY.

RAUCH, CHRISTIAN DANIEL, one of the most distinguished German sculptors, was born at Arolsen, the capital of the principality of Waldeck, in 1777. He early began the study of sculpture; but on the death of his father, in 1797, he was obliged to go to Berlin, where he became valet to Frederick-William II., king of Prussia. On the death of that prince, R. determined to follow the bent of his inclination for the fine arts. In this he was assisted by the new king Frederick-William III., who afforded him facilities for designing and modelling statues, and recommended him as a pupil in the Academy of the Fine Arts. A statue of Endymion and a bust of Queen Luise of Prussia executed at this time, convinced the king of R.'s abilities, and he gave him the means of proceeding to Rome for his further improvement. R. spent six years in that city, working at his profession with much assiduity, to render himself worthy of the friendship of Thorwaldsen and Canova. At Rome, he also enjoyed the friendship of William Humboldt, at that time Prussian minister there.

Among his works at this time were bassi-relievi of 'Hippolytus and Phædra,' a 'Mars and Venus wounded by Diomedes,' a colossal bust of the king of Prussia, and busts of Raphael Mengs and the Count de Wengersky. In 1811, he was called by the king of Prussia to Berlin to execute a monumental statue of Queen Luise. This great work obtained for R. a European reputation. It is placed in the mausoleum of the queen in the garden of Charlottenburg. R. was not, however, quite satisfied with this triumph of his art, but commenced a new statue of the queen, which he finished 11 years afterwards, and which is allowed to be a masterpiece of sculpture. It is placed in the palace of San Souci, near Potsdam. R. after this, lived principally at Berlin, but occasionally visited Rome, Carrara, and Munich. He labored indefatigably in his profession, and by 1824, had executed 70 busts in marble, of which 20 were of colossal size.

R.'s principal works, besides those above mentioned, are—two colossal bronze statues of Field-marshal Blücher, one of which was erected, with great solemnity, at Breslau in 1827; a bronze statue of Maximilian of Bavaria, erected at Munich in 1835; and statues of Albert Dürer, Goethe, Schiller, and Schleiermacher, erected in various places in Germany. His greatest work is the magnificent monument of Frederick the Great, which adorns Berlin. The model for this statue was designed by R. in conjunction with Professor Schinkel, the architect, in 1830; and after 20 years' labor, the statue was finished in 1850, and was inaugurated with great pomp in May 1851.

In his works, R. has the merit of having surmounted the difficulties which modern costume opposes to the ideal representation of personages of the present age; and while he preserved the salient points of his model, he possessed the art of sacrificing the less important details to the exigencies of the beautiful. He died at Dresden on December 3, 1857.

RAUHES HAUS is the name of a great institution founded and hitherto managed by Wichern at Horn, near Hamburg, in

connection with the German Home Mission (*Innere Mission*). It is partly a refuge for morally neglected children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, &c., in promotion of the objects of the Home Mission. The first foundation of this model institution—for such it has become for Germany as well as for France—was laid by a wealthy citizen of Hamburg, who made over to it a piece of land. It was opened on November 1, 1831, by Wichern with 12 morally neglected children. By the addition of new houses, the whole has, however, been very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinder's shop, and bookselling form part of the institution. Recently, about 100 neglected children (one-third are girls) received their education in the establishment. They live in families of 12, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor, manual labor. The watching and care of these children devolve on assistants, who also take part in the instruction, of the institution with a view to prepare themselves for the work of the Home Mission in other institutions. These instructors receive board and clothing, but no salary.

In connection with the R. H., there was founded in 1845 a kind of conventual institute for the education of young men, with a view to become heads or superintendents of similar institutions. Entrance into this institution is limited to the age of 20—30. Besides religious belief and good character, freedom from military duties, bodily and mental health, some scholastic acquirements, and a knowledge of some craft or of agriculture, are required. The boarding-school was established in 1851, and at the same time a seminary was founded, in which 12 brethren of the R. H. are especially prepared for school-work.

RAUMER, FRIED. LUDW. GEORG VON, a noted German historical writer, was born on May 14, 1781, in Wörlitz, near Dessau; studied law and political economy at Halle and Göttingen; filled different law appointments (1806—1811); and in the last-mentioned year was named Professor at Breslau. In 1819, he was called to Berlin as Professor of History and Political Economy. Among his writings may be mentioned—*Sechs Dialoge über Krieg und Handel* (1806); *Das Britische Besteuerungssystem* (Berl. 1810); *The Orations of Æschines and Demosthenes de Corona* (Berl. 1811); *CCI Emendationes ad Tabulas Genealogicas Arabum et Turcarum* (Heidelb. 1811); *Handbuch merkwürdiger Stellen aus den lat. Geschichtschreibern des Mittelalters* (Handbook of Remarkable Passages in the Latin Historians of the Middle Ages, Bresl. 1813); *Vorlesungen über die alte Geschichte* (Lectures on Ancient History, 2 vols. Leip. 1847); *Geschichte der Hohenstaufen und ihrer Zeit* (History of the Hohenstaufen dynasty and their Time, 6 vols. Leip. 1823—1825); *Ueber die geschichtliche Entwicklung der Begriffe von Recht, Staat und Politik* (On the Historical Development of the Ideas of Law, State, and Politics, 2d ed. Leip. 1832); *Prussian Municipal Law* (Leip. 1828); *Briefe aus Paris und Frankreich*, 1830 (2 vols. Leip. 1831); *Briefe aus Paris zur Erläuterung des Geschichts des 16th und 17th Jahrh.* (2 vols. Leip. 1831); *Geschichte Europas seit dem Ende des 15 Jahrh.* (History of Europe from the End of the 15th Century, vols. 1—8, Leip. 1832—1850); *England*, 1835 (2 vols. Leip. 1836); *England*, 1841 (3 vols. Leip. 1842); *Beiträge zur Neuern Geschichte aus dem Brit. Museum*, &c. (5 vols. Leip. 1836—1839); *Italie: Beiträge zur Kenntniss dieses Landes* (2 vols. Leip. 1840); *Die Vereinigten Staaten von Nordamerika* (2 vols. Leip. 1845); *Antiquarische Briefe* (Leip. 1851); *Handbuch zur Geschichte der Literatur* (1864—1866). He also edited the *Historisches Taschenbuch*, &c. The unfavorable reception of an oration of R. in honor of King Frederick II. compelled him, in 1847, to resign the secretaryship of the Academy of Sciences at Berlin. R. was a member of the Frankfurt parliament, where he belonged to the right center. Subsequently he became ambassador at Paris, and then member of the first chamber at Berlin. In 1853, he became Professor Emeritus at the university of Berlin. He died in June 1873.

RAUMER, KARL GEORG VON, brother of the preceding, was born April 9, 1783, in Wörlitz, studied from 1801—1805 at Göttingen and Halle, then at the Mining Academy at Freiberg, and was appointed Professor of Mineralogy at Breslau University in 1811. He took part as a volunteer in the War of Liberation (1813—1814), was translated in 1819 to the university of Halle; and finally, in 1827, was appointed Professor of Mineralogy and Natural History in the university of Erlangen, where he died in 1865. R. obtained a wide reputation by his geographical and geological writings, among which are *Geognostische Fragmente* (Geognostic Fragments. Nürnb. 1811); *Der Granit des Riesengebirges* (The Granite of the Riesengebirge, Berl. 1813); *Das Gebirge Niederschlesiens* (The Mountains of Lower Silesia, Berl. 1819); *A B C Buch der Krystallkunde* (The A B C of Crystallography, 2 vols. Berl. 1817; sup-

plein. 1821). His interest in literary and scholastic education is evinced in his valuable *Geschichte der Pädagogik* (History of Pedagogy, 4 vols. Stuttg. 1846—1855). Other works are his *Lehrbuch der allgemeinen Geographie* (Manual of Universal Geography (Leip. 1848); *Palestine* (Leip. 1850); *Beschreibung der Erdoberfläche* (Description of the Earth's Surface, 6th ed. 1866); and *Kreuzzüge* (1840—64). His autobiography appeared after his death, 1866.

RAUPACH, ERNST BENJ. SAL., a German dramatist, born on May 21, 1784, in Straubitz (Silesia), received his education in the Gymnasium at Leignitz, studied theology at Halle, was for ten years tutor in Russia, held lectures at St. Petersburg University, and was subsequently (1816) appointed there Professor of Philosophy, German Literature and History. R. left Russia in 1822, and died at Berlin, March 18, 1852. Among his early plays, the following are noteworthy—*The Princes Chawansky* (1818); *Die Gefesselten* (The Enchained, 1821); *Der Liebe Zauberkreis* (The Magic Ring of Love, 1824); *Die Freunde* (The Friends, 1825); *Isidor und Olga* (1826); *Rafaele* (1828); *Die Tochter der Luft* (The Daughter of the Air), after Calderon (1829). Among his comedies may be mentioned—*Critic und Anticritic*; *Die Schleichhändler* (The Smugglers); *Der Zeitgeist* (The Spirit of the Time); *Das Sonnett*; and the farces; *Denk an Cäsar* (Remember Cæsar), and *Schelle im Monde*. Of his posthumous works, the principal are—*Jacobine von Holland* (1852); *Der Kegelspieler* (The Player at Nine-pins); the tragicomedy, *Mulier taceat in Ecclesia* (1853); and *Seed and Fruit* (1854). R.'s writings display great knowledge of stage-effect, a happy talent for the invention of new and interesting situations, a power of vivid dramatic diction, and a fine play of verbal wit.

RAVAILLAC, FRANÇOIS, a native of the French province of Angoulême, where he was born in 1578, has acquired an obnoxious reputation as the murderer of Henri IV. of France. In early life, R. was in turn clerk to a notary and master of a school; but having fallen into debt, he was thrown into prison, the confinement and restraint of which preyed upon his health, and produced hallucinations of mind. Under the influence of this mental excitement, he renounced all secular pursuits; and on his release from prison, after having served for a time in the order of the Feuillants, he fell under the influence of the Jesuits, through whose instrumentality it is believed that his insane hatred of the Huguenots, as the enemies of the church, was directed more especially against Henri of Navarre, their former leader. Having resolved to assassinate the king, he eagerly watched his opportunity, and on the 14th of May 1610, as the king was passing in his coach through the narrow street of Laferrière, got upon the right hinder-wheel of the carriage at the moment that its further advance was hindered by a heavy wagon in front of it, and leaning forward, he plunged a knife into the breast of the king. The first blow glanced aside, but at the second thrust, the knife entered the heart. R. escaped in the confusion, but being soon captured with the knife still in his hand, he admitted his guilt; and having been formally tried and condemned, he was put to the torture; and suffered death on May 27, in the Place de Grève, under circumstances of great cruelty, his body being torn asunder by horses. R. refused to the last to acknowledge whether he had had instigators or abettors, and hence the widest scope was given to conjecture, suspicion being in turn directed to the queen, Marie de' Medici, and her favorites, the Concini, to the Duc d'Epéron, and to the Spanish court and their Jesuit advisers, but there is no good ground for such suspicions. M. Henri Martin (*Histoire de France*) and M. Poirson (*Histoire de Henri IV., tome II.*) have examined the particulars of the process instituted against R. with scrupulous impartiality, and have come to the conclusion that the real cause of the crime was fanaticism degenerated into monomania.

RAVAN'A (from the causal of the Sanscrit *ru*, cry, alarm, hence literally he who causes alarm) is the name of the *Rākshasa* (q. v.) who, at the time of Rāma, ruled over Lankā or Ceylon, and having carried off Sītā, the wife of Rāma, to his residence, was ultimately conquered and slain by the latter. Ravan'a is described as having been a giant with ten faces, and in consequence of austerities and devotion, as having obtained from S'iva a promise which bestowed upon him illimited power, even over the gods. As the promise of S'iva could not be revoked, Vishn'u evaded its efficacy in becoming incarnate as Rāma, and hence killed the demon-giant. See under VISHN'U and RAKSHASA.

RAVELIN, in Fortification, is a triangular work of less elevation than the main defences, situated with its salient angle to the front before the curtain, which with the shoulders of the adjoining bastions, it serves to protect. It is open at the rear, so as to be commanded by the curtain, if taken, and is separated from that work by the main ditch, while in its own front the ditch of the ravelin intervenes between itself and the covert-way. The guns of the ravelin sweep the glacis, and perform a very important function in commanding the space immediately before the salient angles of the two next bastions, ground which the guns of the bastions themselves cannot cover. The bastions, on the other

hand, flank the ravelin. In the fortifications of Alessandria, designed by Bousmaud in 1808, the ravelins are placed in front of the glacis. See the diagrams in art. FORTIFICATION.

The original name of the ravelin was *riocellino*, which indicates a derivation from *vegliare*, to watch, the ravelin having probably been at first a watch-tower, answering to the still earlier barbican.

RAVEN (*Corvus corax*) a species of Crow (q. v.), remarkable for its large size. It is more than two feet in length from the tip of the bill to the extremity of the tail. The bill is thick and strong, compressed at the sides, the mandibles sharp at the edges; the upper mandible curved at the tip, and exceeding the lower in length. The base of the bill is surrounded with feathers and bristles. The tail is rounded, but the middle feathers are con-

Raven (*Corvus corax*).

siderably the longest. The wings are long—extending from tip to tip to 52 inches—the fourth quill feather being longest. The color is a uniform black, with more or less metallic lustre, which is particularly conspicuous in the elongated throat-feathers of the male, and is wanting in the whole plumage of the female and young.

The R. is a bird of wide geographic distribution.* It is found in almost all parts of the northern hemisphere, but most abundantly in the more northern and the mountainous parts of it. In other parts of the world, and within the northern hemisphere itself, however, other closely allied species have probably been often mistaken for it. There are several species of crow very similar to the R. in color, size, and habits.

The R. is generally to be seen either solitary or in pairs. It is one of the most thoroughly omnivorous of birds. It feeds on fruits and nuts in forests; it picks up worms or molluscs; it sucks eggs; it kills young hares, or even lambs; it rejoices in carrion, and not unfrequently attacks weak or sickly beasts, almost invariably choosing their eyes as its first point of assault. It generally makes its nest of sticks, coarse weeds, wool, hair, &c., in rocky places, on a narrow ledge of a precipice, or in some similar situation. Ravens are occasionally captured when young, and become interesting pets, being remarkable for their impudence and cunning, their look of sage thoughtfulness, their inquisitiveness, their mischievous propensities, which prompt them to destroy everything that can be destroyed, and always as if the fact of its destruction afforded them pleasure, their thievishness, their love of glittering things, and their power of imitating human speech, which is almost equal to that of parrots. The R. is celebrated for its longevity, and instances are on record of ravens which have certainly lived for seventy or eighty years.

The R. has been generally reckoned a bird of ill-omen, probably on account both of its color and its extremely harsh croaking voice, which may sometimes be heard in fine weather as if coming from the sky, the R. being a bird of powerful wing, and often soaring very high in the air.

RAVENNA, an important city of Central Italy, 43 miles east-south-east from Bologna, and 4½ miles from the Adriatic; lat. 44° 24' N., long. 12° 12' E. Pop. (1881) of the commune, 60,573; of the town proper, 12,100. It is situated in the midst of a well-watered, fertile, and finely-wooded plain. R. is surrounded by old bastions, and by walls where may still be seen the iron rings to which the cables of ships were formerly fastened; the sea is now at the distance of about 4 miles from the city. The streets are wide; the squares are adorned with statues of the popes, and the houses have a gloomy appearance. R. is an ancient city, rich in monuments of art. The cathedral, built in the 4th c., was almost wholly rebuilt in 1734; it has five naves, supported by 24 marble pillars. Of the other 14 churches and other architectural antiquities several date from the 5th and 6th centuries. San Francesco possesses the tomb of Dante, erected in the 15th cent.

ury. The library of R. contains 50,000 volumes. It has an archaeological museum, and many educational institutions. R. has manufactures of silk, and its trade is facilitated by a canal to the sea.

R. was probably of Umbrian origin; it was at least an Umbrian city when it passed into the hands of the Romans. Augustus made it a first-class seaport and naval station; 400 years later, the Emperor Honorius took refuge there, and made R. the capital of the empire. The city was taken by Odoacer, then by Theodoric and by Totila; the latter was conquered by Narses, who made it the residence of the exarchs in 553. In 1218, it became a republic. In 1275, Guido da Polenta conquered it, and there established his court, where he received Dante. R. was afterwards taken by the Venetians, who kept it till 1509. Under Charles V., it passed into the hands of the popes.

Under the walls of R., a great battle was fought in 1512 between the French and the Spaniards, in which Gaston de Foix purchased victory with his life.

RAVENSBURG, a town in Württemberg, and capital of a bailiwick of the same name, in the Circle of the Danube, is pleasantly situated in a fertile and romantic valley, the Schlusenthal, at the foot of a hill planted with vines. The principal industries are spinning wool and flax, weaving woollen fabrics, linen, and stockings, bleaching, making paper, playing-cards, furniture, wood-work, sawing wood, &c. Pop. (1880) 9388.

RAVENS-CROFT, THOMAS, an eminent English musical composer. He was born in 1592, received his musical education in St. Paul's choir, and had the degree of Bachelor of Music conferred on him when only 15 years of age. In 1611, appeared his *Melismata, Musical Phantasies*, &c., a collection of 23 part-songs, some of them of great beauty; and three years later, he brought out another collection of part-songs under the title of *Brief Discourses*, with an essay on the old musical modes. Turning his attention to psalmody, he published, in 1621, a collection of psalm-tunes for four voices, entitled *The Whole Book of Psalms, composed into Four Parts by Sundry Authors to such Tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France and the Netherlands*. This was the first publication of its kind, and all similar works of later date have been largely indebted to it. Among the contributors to this collection were Tallis, Morley, Dowland, and all the great masters of the day; the name of John Milton, the father of the poet, appears as the composer of York and Norwich tunes; while St. Davids, Canterbury, Bangor, and many others which have since become popular, are by R. himself. Each of the 150 Psalms has a distinct melody assigned it. Two collections of secular songs similar to the *Melismata*, and entitled *Pammelia* and *Deuteromelia*, have been assigned to R.; but it is probable that only a few of these songs were composed by him, while he may have revised and edited the whole. A selection from the *Melismata, Brief Discourses, Pammelia*, and *Deuteromelia* was printed by the Roxburghe Club in 1823. R. died about 1640.

RAVIGNAN, GUSTAVUS FRANCIS XAVIER DELACROIX DE, a celebrated preacher of the Jesuit order, was born at Bayonne, December 2, 1795. He studied in the Lycée Bonaparte at Paris, and having embraced the legal profession, and obtained his degree, was named auditor of the Cour Royale at Paris, and afterwards, in 1821, received an appointment in the Tribunal of the Seine. The prospect thus opened for him, however, soon lost its attractions, and in 1822 he formed the resolution of relinquishing his career at the bar, and entering the church. Having spent some time in the College of St. Sulpice, he soon passed into the novitiate of the Jesuits at Montrouge, and thence to Dole and St. Acheul for his theological studies, at the termination of which he was himself appointed a professor. On the expulsion of the Jesuits from France in 1830, R. withdrew to Freiburg in Switzerland, where he continued to teach in the schools of his own order; but after some time he was transferred to the more congenial duty of preaching, first in several of the Swiss towns, and afterwards in Savoy, at Chambéry, at St. Maurice, and other places. At length, in 1835, he appeared in the pulpit of the cathedral of Amiens. In the following year, he was chosen to preach the Lenten sermons at the church of St. Thomas d'Aquin in Paris; and finally, in 1837, was selected to replace Lacordaire (q. v.) at Notre Dame, in the duty of conducting the special 'conferences' for men which had been opened in that church. For ten years Père de R. occupied this pulpit with a success which has rarely been equalled, and his 'conferences' are regarded as models of ecclesiastical eloquence. In 1842, he undertook in addition to preach each evening during the entire Lent; and it is to the excessive fatigue thus induced that the premature breakdown of his strength is ascribed. To the labors of the pulpit, he added those also of the press. He published an Apology of his order in 1844; and in 1854 a more lengthened work with the same view, *Clement XIII. et Clement XIV.*, 2 vols. 8vo, which was intended as a reply to the *Life of Clement XIV.*, by the Oratorian

Father Theiner. These, with some occasional sermons and 'conferences,' constitute the sum of the publications issued during his life. In 1855 he was invited by the Emperor Napoleon III., to preach the Lent at the Tuilleries. On the 26th February 1858 he died in the convent of his order at Paris, in his 63d year. His Memoirs have been published by his brethren, and a collected edition of his works and remains has been for some time in progress.

RAVINA'LA. See TRAVELER'S TREE.

RAWAL PINDI, a large, walled town of the Punjab, in the doab between the rivers Indus and Jhelum. It contains a large bazaar, and carries on an active transit-trade between Hindustan and Afghanistan, but is not otherwise noteworthy. Pop. (1868) 19,222.

RA'WICZ, a town of Prussia, in the government of Posen, close to the Silesian frontier, 64 miles south of Posen by railway. It is surrounded by walls. Spinning, weaving, brewing manufactures of tobacco and leather, and a considerable trade, are carried on. Pop. (1880) 12,260.

RAWLINSON, SIR HENRY, K.C.B., oriental scholar and diplomatist, was born at Chadlington, Oxfordshire, in 1810, and educated at Ealing, Middlesex. He entered the East India military service in 1826, and served in the Bombay presidency until 1833, when he was appointed to assist in reorganizing the army of the Shah of Persia. He had early devoted himself to eastern languages and antiquarian researches, and when stationed at Kermanshah, in 1835, he began to study the cuneiform (q. v.) inscriptions of Persia. He announced his cuneiform discoveries in 1837—1838 to the Royal Asiatic Society of London, and published his travels in Susiana in the *Geographical Society's Journal*. He also made a translation of the Behistun inscription, a most important event in the history of the study of the old Persian languages. After residing as political agent at Candahar (1840—1842) and Bagdad (from 1843), he returned to England with the rank of Consul-general in 1855. In January 1858, he was elected M.P. for Reigate, but vacated his seat in September, on being appointed a member of the Council of India. In 1859, he proceeded to Teheran as envoy-extraordinary and minister-plenipotentiary to the court of the Shah. He was returned to parliament as member for Frome, and retained his seat till the general election of 1868. In 1871, R. became president of the Royal Geographical Society, an office which he retained until June 1873.

R. is the author of a large number of most valuable papers on geography, archæology, history, and modern politics, chiefly connected with Persia and the surrounding countries. The greater number of these have been read to learned societies, but others have appeared in periodical publications. He is also the author of a work entitled *England and Russia in the East* (1875). R. has not confined his attention to eastern subjects, and his addresses to the Geographical Society, and on geography and history generally to the Midland Institute at Birmingham on October 6, 1873, show how varied and extensive his acquisitions are. R. was admitted as corresponding member of the Institute of France in 1837, and in 1852 was made Chevalier of the Order of Merit by the king of Prussia.—RAWLINSON, REV. GEORGE, brother of the preceding, graduated at Oxford, and was elected a fellow and tutor of Exeter College. Appointed Bampton lecturer in 1859, he published his lectures in the following year under the title of *Historic Evidence for the Truth of Christian Records*. Other works of R.'s are an edition of Herodotus, in which many of his brother's discoveries are incorporated; *The Five Great Monarchies of the Ancient World—Chaldaea, Assyria, Babylonia, Media, and Persia; Manual of Ancient History*, 1869; the *Sixth Oriental Monarchy—Parthia* (1873); and the *Seventh Oriental Monarchy—the Sassanians* (1875).

RAY (*Raia*), a Linnean genus of cartilaginous fishes, belonging to the order *Plagiostomi* (q. v.) of Müller, and now divided into a number of genera, which form the family *Raidæ* of many naturalists, and the suborder *Raioi* of some. The true rays have a flat body; the pectoral fins are large and fleshy, appearing as lateral expansions of the body, and along with it forming a circular disc or a rhomboid, to which is attached a rather long and slender tail. The pectoral fins are prolonged till they meet in front of the snout, and backwards till they join the ventral fins. The eyes look upwards and the spout-holes or spiracles are also directed upwards. The gill-openings, which are five in number, are on the under side of the body, where also the mouth is situated. The gills are close behind the mouth; and towards the tail are the stomach, intestines, and other viscera, in a circular cavity. The males are furnished with claspers. The eggs are large, resembling those of sharks, but more rectangular in form; thin horny cases, with projections at each of the four corners, having such a resemblance to a hand-barrow, that on some parts of the English coast they receive the name *Skate-barrows*. They

are also familiarly known as *purses*, and are very often to be seen cast up by the waves upon the beach.

Rays live mostly near the bottom of the sea, and where the bottom is sand or mud. When disturbed, they glide in an undulating manner, and defend themselves against assailants by lashing with the tail, which is generally armed with spines, and in some species—called *Sting Rays* (q. v.), the family *Trygonidae* of some naturalists—carries a single long and strong spine, notched on both sides, a formidable weapon, which is used somewhat as a saw. Rays are very voracious; they devour fishes, molluscs, and crustaceans. Many of the rays are popularly called *SKATE*. All of them are edible; some, however, are much better than others; and whilst, on some parts of the British coast, they are regularly used for food and brought to market, on other parts of the coast, they are rejected, and are thrown out to rot on the beach. Of British species two of the most common are the Thornback (q. v.) and the Homelyn (q. v.). Another is the Common Skate, also called the Blue Skate or Gray Skate (*Raja Batis*), which is better than either the Thornback or Homelyn as an article of food. The Long-nosed Skate (*R. mucronata*) and the White Skate (*R. oxyrinchus*) are also common. The skates sometimes attain a very large size, more than eight feet in breadth.—*Torpedo* (q. v.) *Cephaloptera* (q. v.), &c., are genera of rays.

RAY (or, as he himself occasionally spelt it, WRAY), JOHN, an eminent naturalist, was born at Black-Notley, near Baintree, in Essex, 29th November 1627. He went to Cambridge University, where, after having finished his course, he was elected a Fellow, and appointed Greek lecturer, and afterwards mathematical tutor in Trinity College; but after a time began to devote himself entirely to the study of natural history. Accompanied by a kindred spirit Francis Willughby, a friend and former pupil of his own. R. traveled over most of the United Kingdom, collecting and investigating botanical and zoological specimens; and in 1663, they started on a tour through the Low Countries, Germany, Italy, and France, with a similar object, Willughby taking the zoology under his charge, leaving R. the botany. In 1667, R. was elected a Fellow of the Royal Society, to whose *Transactions* he occasionally contributed valuable papers. In 1672, his friend Willughby, with whom R. had lived ever since he had left the university, died, leaving him guardian to his two young sons (the younger of whom was afterwards raised to the peerage as Baron Middleton), an office which R. discharged, and then, after several changes of residence, settled down in his native village, where he died, January 17, 1705.

As a botanist and zoologist, R. ranks very high, being distinguished for his patience, acuteness, and sagacity; and in knowledge he seems to have been far in advance of his time, as the new method of classification of plants which he proposed, though little appreciated or adopted by his contemporaries and immediate successors, was eagerly laid hold of by Jussieu and others, under whose hands it became the foundation of what is now known as the 'Natural System' of classification. R.'s zoological works are considered by Cuvier as the foundation of modern zoology. In zoology, as in botany, R.'s works are remarkable for the precision and clearness of the classification which he adopts, his divisions in the former subject being founded on the structure of the heart and the organs of respiration. The chief of his works on botany are *Methodus Plantarum Nova* (1682, 2d edition, revised and amended by himself, in which he details the principles of his new method of classification of plants; *Catalogus Plantarum Angliæ* (1670), the basis of all the subsequent floras of this country; and a second (1677), third (1690), and fourth (1696) edition of which was published by himself; *Historia Plantarum* (3 vols. 1686–1704), a compilation, including descriptions of all the species which were then known. His zoological works include the *Synopsis Methodica Animalium Quadrupedum et Serpentinæ Generis* (1693), and three posthumous volumes on Birds, Fishes, and Insects, published by Dr. Derham. He was also the author of some theological works. His friend Willughby having collected the materials for an extensive work on the animal kingdom, left to R. the task of arranging and classifying them, and the work accordingly appeared in 3 vols., the *Ornithologia* in 1676, with an English translation by R. in the following year, and the *Historia Piscium* in 1686 (2 vols.). In these volumes were described a large number of species of birds and fishes, which had escaped the observation of previous naturalists.

RAYNOUARD, FRANÇOIS, JUSTE MARIE, a French poet and philologist, was born at Brignoles, in Provence, September 8, 1761. He studied at Aix, and came to Paris to cultivate literature at the age of 23, but soon went back to the south, and joined the bar at Draguignan, where he acquired a high reputation. In 1791, he was elected a member of the Legislative Assembly; but after the fall of the Girondins, whose opinions he shared, he was thrown into prison, and fortunately forgotten. Released from confinement after the fall of Robespierre, he resumed his profession of advocate, and in the course of five or ten years, acquired a modest

competency. He then returned to Paris, and devoted himself anew to literary pursuits. His first poem, *Socrate au Temple d'Aglaure* (Par. 1803), was followed by the tragedies, *Éléonore de Bavière* and *Les Templiers*, the latter of which was brought on the stage in 1805, and met with unbounded success. Two years later, R. was chosen a member of the Academy, of which he became perpetual secretary in 1817. He had been made a member of the imperial legislative body in 1806, and Napoleon, it is said, even meditated appointing him to the presidency, but could not get over R.'s brusque manner and fearless independence of spirit. The principal dramas which he wrote during the régime of Napoleon, besides those already mentioned, are *Scipio*, *Les États de Blois*, *Don Carlos*, *Charles I.*, *Debora*, *Jeanne d'Arc à Orléans*. Towards the fall of the Empire, his attention was turned to linguistic studies, particularly to the study the Provençal language and literature; and his researches into the origin, grammatical rules, and transformations of the Romance tongue, led to many valuable discoveries, though his theories as to the relation of the language of the troubadours to the other tongues derived from Latin, have been shown to be erroneous (see ROMANIC LANGUAGES). His chief writings in this department are—*Éléments de la Grammaire Romane* (Par. 1816); *Choix de Poésies Originales des Troubadours* (Par. 6 vols. 1816–1821); *Grammaire comparée des Langues de l'Europe Latine dans leur Rapports avec la Langue des Troubadours* (Par. 1821); *Observations Philologiques sur le Roman du Rou* (Rouen, 1829); *Influence de la Langue Romane* (Par. 1835); and *Lexique Roman, ou Dictionnaire de la Langue des Troubadours* (Paris, 6 vols., 1838–1844). R. died at Passy, near Paris, October 27, 1836.

RAZOR, the sharp-bladed instrument used for shaving the beard, has been in use from very ancient times; it is alluded to by Homer, and shaving was in fashionable use by the Greeks and Romans (see BEARD), as a mark of civilization. Razors are almost universally metal blades, made exceedingly sharp; but an exception to this is found in some of the razors used by savage nations, as, for instance, the Tahitians, who use pieces of shells and sharks' teeth, upon which they grind very fine edges, sufficiently sharp to remove the beard. The Chinese and Japanese, who shave the head as well as the chin, use razors similar to the European, except that they rarely have handles. The steel of which they are made is of a remarkably fine quality.

The manufacture of razors, in Great Britain, is chiefly carried on in Sheffield, which place also supplies a large export trade. Great care is exercised in choosing the steel for making the blade, but notwithstanding this, there is scarcely an article made by cutlers which is so uncertain in quality when used. Nearly 20 operations are required to produce a razor; nevertheless, such is the perfection to which manufactures are brought by a division of labor, and the application of machinery, that the razors supplied to the army (at the contract-price of 4*d.* each) cannot be surpassed for quality.

RAZOR-BILL, or RAZOR-BILLED AUK (*Alca torda*), a species of Auk (q. v.), also called the Black-billed Auk, very common on the coasts of Britain, and of all the northern parts of

Razor-Bill (*Alca torda*).

the Atlantic Ocean, frequenting lofty precipices, from which its eggs are taken, with those of guillemots, &c., by persons who are let down by ropes for that purpose. The eggs are esteemed a delicacy; and the flesh of the bird itself is much used for food. Great numbers of razor-bills are annually killed for the sake of their feathers, particularly on the coast of Labrador, where they are extremely abundant. The R. is about 17 inches long, from the extremity of the bill to that of the tail. It is a very fierce bird, and if seized, will lay hold of the hand in return, and submit to be choked ere it will let go. The egg is about three inches long. The bird lays one or two, upon ledges of rock or in fissures.

RAZOR-FISH, or RAZOR-SHELL. See SOLEN.

RAZOR-STROP, an article used for the purpose of sharpening razors. It usually consists of a piece of wood, an inch and a half broad, and 10 or 12 inches long, upon each side of which is glued a piece of leather; one of the pieces of leather is usually dressed with a composition of carbonate of iron and grease, which is used first, and the sharpening is finished on the undressed leather of the other side. A leathern strop is frequently used without fixing on wood. In the West Indies, razor-strops are commonly made of pieces of the wood of *Yucca gloriosa*, *Eriodendron anfractuosum*, *Agave vivipara*, *Ochroma lagopus*, and *Anona palustris*, all of which contain minute deposits of silica in their cellular structure, which render them very efficient for the purpose. Species of *Boletus* are used in Britain.

RÉ, ÎLE DE (*Rex insula*), is a small island on the coast of the French department of Charente Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton. It is about 18 miles long, and 4 miles broad. It contains 5600 inhabitants, most of whom are engaged in fishing. The island is skirted by high cliffs, and strongly fortified by four forts. It has several good harbors and two light-houses; but there are neither springs nor wood on the island, and next to fishing, the culture of the vine constitutes the chief occupation of the islanders. Brandy made from the wines of Ré, and sea-salt, are the principal articles of the trade on the island. St. Martin, which ranks as the capital of Ré, is a well fortified little town with a good harbor, is the chief seat of the trade, and has (1872) 1916 inhabitants. Oyster-farming has of late become an important branch of industry. See **OYSTER**.

REACTION, a term used in reference to the political history of a nation; to designate that tendency, often showing itself, to recoil from the effects of reform or revolution, and to seek a restoration of the previous state of things, or even of one still more antiquated and despotic. The causes that lead to reaction are various. Sometimes it springs, partly at least, from mere disappointment at the smallness of the *visible* results of those changes advocated with so much eloquence, and waited for with so much enthusiasm and hope. The inconsiderable imagination of the people expects a millenium to follow every important change; and when, after the event, men find they are still in the old world of imperfections, hardships, and sorrows, they are prone to believe that they have been deluded, and are only too willing to lend an ear to the insidious misrepresentations of those who are opposed to all progress. But more frequently political reaction springs from immature, or injudicious, or extravagant revolution. The times are not yet ripe (as in the first Italian revolts), or the leaders are unfit (as in the German and Hungarian struggles of 1848—1849), or excesses are committed (as in the great French outbreak of 1789), and so a revolution is tipped in the bud, or overthrown on the battle-field; or, inflamed with sanguinary thirst of revenge, it goes mad in a 'reign of terror,' and exhausting itself in unprofitable frenzies, falls at last an easy prey to any bold and unscrupulous adventurer whom the crowd may elect out of desperation and disgust of anarchy, and whose rule is as absolute as any that preceded it. A reaction, may thus, in certain cases, be useful, in so far as it teaches reformers and revolutionists the point beyond which nature forbids them to go; but its agents are almost invariably base in character, odious in their principles, and selfish in their projects. Religious reactions exhibit the same characteristics as political ones, and proceed from the same causes.

REACTION is the term employed in Medicine and Surgery to indicate the process of recovery from a state of collapse. The subjects of Collapse, Reaction, and the general effects of Shock upon the system, are considered in the article on **SHOCK**.

READE, CHARLES, D.C.L., one of the more distinguished novelists of the day, was born in 1814. He is the youngest son of the late John Reade, Esq., of Ipsden House, Oxfordshire. He received his college education at Oxford, and so distinguished himself as to secure a Fellowship. In 1843, he was called to the bar as a member of Lincoln's Inn; but his legal studies may be presumed to have been merely nominal, and in no long time it became obvious that his chosen career was that of literature. The books by which he first became known as a writer of distinct mark and promise were his *Peg Woffington* and *Christie Johnston*, both full of talent, though as yet somewhat crude and immature. In 1856, he fairly established his reputation in the novel in 8 vols., *Never too Late to Mend*, the first of a series of novels each illustrating some social or public evil. Among his subsequent works are a tale in one volume, *The Course of True Love*, remarkable for a rare nicety and subtlety in the delineation of its leading female character; *White Lies* (8 vols. 1858); *The Cloister and the Hearth*; *Hard Cash* (1863); *Griffith Gwaint* (1866); *Put Yourself in His Place* (1870); *A Terrible Temptation* (1871); *A Simpleton* (1873); and *A Woman Hater* (1877). He is besides the author of several dramas, which have had success on the stage; the most general favorite, perhaps, being that entitled *Masks and Faces*. Mr. R. is by common consent a writer of marked ability. He has much

of the true talent of the *raconteur*, along with considerable dramatic instinct, and from all his later novels, a sense of general intellectual vigor is strongly borne in upon the reader; while a certain wayward crotchitness and odd aggressive eccentricity from time to time cropping out, serve rather to give to his writing some relish and sting of individuality, than seriously to mar its effect.

REA'DING, a flourishing municipal and parliamentary borough of England, capital of Berkshire, stands on the left bank of the Kennet, 1½ mile above the junction of that river with the Thames, and 86 miles west of London by the Great Western Railway. It is irregular in plan, though recently it has been improved in this respect. The tongue of land immediately above the confluence of the rivers, is the chief business part of the town. The church of St. Lawrence, with a tall flint tower, still shows traces of its original Norman character; and the Benedictine Abbey, now a mere shell, was founded in 1121, and was at one time the third in size and wealth in the country. Of the numerous educational establishments, the free grammar-school, to which are attached two fellowships at St. John's College, Oxford, and two scholarships, has an endowment of £50 per annum. R. is an important mart for corn and other agricultural produce, carries on manufactures of silks, silk-ribbons, &c., and has extensive iron-works and a large biscuit factory. Pop. (1871) 32,324; (1881) 42,050.

READING, a city of Pennsylvania, U.S., on the left bank of the Schuylkill River, 68 miles north-west from Philadelphia, pleasantly situated on an ascending plain, and supplied by a mountain behind it with streams of pure water. R. has regular streets, public offices, several newspapers, blast-furnaces, rolling-mills, foundries, manufactories of steam-engines and machinery, cottons, woollens, nails; also flour and saw-mills, with a large trade in coal. Pop. (1870) 33,980; (1880) 43,280.

READING AND SPEAKING. Reading is the delivery of language from writing; speaking is the utterance of spontaneous composition. Reading is merely mechanical when words are intelligibly but unimpressively delivered; and it is oratorical in effect when the sentiment proper to the utterance is expressed by pauses, tones, emphasis, &c. Recitation from memory is another form of reading, the matter being delivered from a mental transcript. This mode is highly favorable to oratorical effect, but it is limited in application, and untrustworthy where exactness of phraseology is important. Speaking from spontaneous composition is the highest form of oratory. The qualities requisite for these are very different.

To read well involves a perfect understanding of the construction of sentences, and ability to analyse complex forms of composition, and discriminate between essential and expletive words; it also involves a nice perception of the qualities of modulation, and their relation to expressiveness, together with ability to regulate the voice so as exactly to suit the sound to the sense. The study of the art of reading is thus valuable as a means of improvement in composition, as well as for its influence in refining the taste, and exercising all the faculties of perception, expression, and adaptation.

In good reading, the thoughts of the writer must first be taken into the reader's mind, and then delivered as the writer himself might have uttered them immediately on their conception. Children, when set to read language above their comprehension, are of necessity merely mechanical readers; and in this way they acquire habits of unintelligent reading, which are seldom perfectly thrown off in after-life. In silent reading, or the perusal of language for our own information, we gather the sense as we proceed, and correct misapprehensions by reflection; in reading aloud for the information of others, we must perfectly comprehend the matter before we utter it, so as to avoid misleading the hearer. A practised reader can, no doubt, exercise sufficient prevision at the time of reading, by keeping his eye in advance of his utterance, to read any ordinary composition fairly at first sight; but for public reading this would be insufficient. Whatever is to be read in public should first be well studied in private. The reader thus knowing definitely what he has to express, will give forth no uncertain sounds, and his manner will have the freedom of memoriter delivery, without the disadvantage of its constraint upon the mind. His whole attention will be concentrated on the object of his reading, the effective conveyance of the matter and spirit of the composition. The presence of the book before him will be necessary chiefly to give confidence, and prevent the possibility of rambling. The eye, assisted by memory, will take in clauses and even sentences at a glance, so that it may be freely raised during utterance.

If the eye of a reader is fixed on the book, he seems to be perusing it for his own information; but if he looks his hearers in the face, as, with due preparation, he should be able to do, his delivery may have all the qualities of spontaneous oratory, and be to the hearers speaking rather than reading. This effectiveness is rarely exemplified, because the requirements for public reading are so little understood, and so habitually neglected in our

systems of education. The tameness, monotony, and rythmical singsong so generally associated with reading, have created a prejudice against the use of 'paper' in pulpit addresses, in consequence of which, in some churches, the practice of reading sermons is discountenanced, while in others it is positively interdicted. The quality of sermons, as compositions, is seriously impaired under such circumstances; but the cure for bad reading—against which the prejudice is directed—is *good* reading. All men cannot be orators, but all may be taught to read oratorically; and were students systematically trained in this art, the services of the church would be rendered far more attractive and influential. In the absence of this training, preachers are the most ineffective of public speakers; and discourses prepared to be delivered from memory are among the meanest species of literary compositions.

The chief points of difference between ordinary reading and the utterance of spontaneous composition, are the uniform force and time, and continuative tones of the former, as contrasted with the reflective breaks and varying modulations and emphases of the latter. The speaker feels what he wishes to say, and he conveys with definiteness the felt relation of each word to the idea which is dominant in his mind. Expletive and explanatory phrases are given parenthetically; ellipses, interpolations between grammatically related words, smiles, quotations, and all other elements of rhetorical style, are indicated by changes of modulation; and the *point* of every sentence is made unmistakably apparent. The reader sees all the parts of a sentence level to his eye, and he is apt to deliver them with a corresponding indiscriminateness of manner; either without variety of time, tone, and stress, or with mere alternation of force and feebleness, or the equal indefiniteness of emphasis on every phrase.

The first requisite for effective reading is a clear conception of the author's intention, together with such a command of the voice as may enable the reader to express that one meaning to the exclusion of all other possible meanings. For every cluster of words is like a many-sided crystal, which may be made to throw light from any of its facets, according as one or another of them is present uppermost. The most prominent word in the utterance of a sentence is not necessarily the most important grammatical word, but that which is new in reference to the context; and such words as are already before the mind—whether directly stated, inferentially included in former expressions, or otherwise implied—are pronounced with subordinateness of manner. Thus, in the following lines:

The quality of mercy is not strained,
It droppeth as the gentle rain from heaven
Upon the place beneath. It is twice blessed:
It blesseth him that gives and him that takes.

If the first line were read independently, it would be emphasized as follows:

The quality of *mercy* | is not *strained*;

but if read in connection with the preceding context, the emphasis would be different. Thus:

Portia. Then must the Jew have mercy.
Shylock. On what compulsion must I? Tell me that.

'Mercy' and the 'compulsion' of mercy being thus already before the mind, the chief point in Portia's reply will now be:

The quality of mercy *is* not strained,
It droppeth, &c.

But, as to 'drop' is the natural characteristic of 'rain,' and as rain always falls 'from heaven,' and necessarily 'upon the place beneath,' these implied words will be pronounced subordinately, thus:

It droppeth as the *gentle rain* from heaven
Upon the place beneath.

Bearing in mind, further, that mercy is of necessity 'blessed,' the reader will proceed:

It is *twice* blessed :

and as the object of the speech is to *solicit* mercy, he will give prominence to the word that advances the suit. Thus:

It blesseth him that *gives*, and him that takes.

On this principle, the reader shows that he has, in his own mind, performed the writer's process of thought, and so made the language which he interprets virtually his own. But in order to express with definiteness the thoughts and sentiments thus adopted, the reader must have the *instrument* of expressiveness perfectly under control. His voice should have no more predisposition to any particular tune than the flute or violin of a musician. Tones have an inherent value, which is above and independent of language, so that assertive construction may be made to convey interrogative meaning, and interrogative language

may have assertive or imperative force. The modulations of the voice unravel all the complexities of composition; separating words from their immediate context, or connecting them with others from which they are most widely separated in the sentence. Thus, in the following lines:

Slowly and sadly we laid him down,
From the field of his fame fresh and gory,

the clause 'fresh and gory,' is, by relative modulation, shown to refer to 'him' in the preceding line, and not to the nearer words 'fame' or 'field.' So, also, in the following passage: 'And they came with haste, and found Joseph and Mary, and the babe lying in a manger.' Here the series, 'Joseph and Mary | and the babe' is divided by a modulation of the voice, so as to show that the last word 'babe' is alone the grammatical antecedent to the clause 'lying in a manger.' From such illustrations it will be obvious that good reading involves close thinking, and that the governing qualities of tone demand accurate appreciation and careful culture.

The tones of the speaking voice are all more or less *inflected*, in which respect they differ essentially from singing tones, which are level, and only varied in pitch. The term 'modulation,' as understood by elocutionists, has reference to the general pitch of the vocal inflections in a passage. The inflections themselves are all either rising or falling. The rising turn of voice carries on the hearer's attention to what is to *follow*—the falling turn directs attention to what has gone *before*; the former asks, or appeals to the hearer—the latter affirms or enjoins from the speaker; the former is negative—the latter is positive. Simple inflections rise or fall directly from their accentual pitch to their termination, and the range of the inflection may have any extent, from less than a semitone to more than an octave. The strongest rising tones are expressive of interrogation, incredulity, or entreaty, and the strongest falling tones of affirmation, assurance, or command. Compound inflections unite the two vocal movements—falling before a rising termination, and rising before a falling termination—with one accentual impulse; and the effect of this opposition of tone is to add to the expressiveness of the termination a suggestion or *inference* in accordance with the expressiveness of the commencing turn. Thus: 'Not one,' with compound rising tone, implies 'but more.' 'Even one,' with compound falling tone, implies 'and not more.'

The emphatic force of tones depends on their accentual pitch in relation to that of preceding tones, as well as on the extent and the direction of the inflection. The amount of possible variety in these degrees is exceedingly great, but the peculiar expressiveness of individual modes of inflection is definite, traceable to systematic principles, and of limited extent, depending principally on three qualities—

1. Rising or falling accent as well as termination; as
Constant, Constant.
2. Rising or falling accent with opposite termination; as
Constant, Constant.
3. Accent higher or lower than preceding pitch; as
die? To To dream.

To sleep. sleep? Perchance to

These three sources of vocal variety the student of elocution should have under ready and perfect control.

The art of elocution has received comparatively little attention in modern times. The value of a good delivery is certainly not less now than it was among the orators of ancient Greece and Rome; but the assiduity with which the art was cultivated by the latter, and the estimation in which it was held by them, present a strong contrast to the negligence and apathy of modern speakers in regard to delivery. This fact is not easily accounted for; the influence of elocution being such, that an inferior address well delivered never fails to create a stronger impression on an audience, than the most masterly composition that lacks the graces and enforcements of effective utterance and action.

The model for effective reading is to be found in the ordinary style of animated conversation. The speaker's tones are not governed by the laws of punctuation, or by formal grammatical periods. Every clause in a sentence is, to the speaker, a period. The most complex sentence is only an aggregation of correlative sentences, each of which is a separate act of thought, and should be delivered as such in reading, as it always is in speaking. Modulation will show the relation of each part to the whole, but inflection should at the same time show each part to be in itself complete, as the statement of a distinct though subordinate fact or circumstance.

The rules which some elocutionists have laid down for the reading of sentences, are clearly at variance with this natural principle of intonation, and they lead to an artificiality of manner which is at best a pedantic tune. The formal arrangements of inflections

which have been gravely prescribed for 'simple' and 'compound,' 'commencing' and 'concluding' serieses, 'penultimate' and 'ante-penultimate' clauses, &c., have done much to discourage students from paying proper attention to the art of elocution, and have almost justified the denunciations of some authors, who have declared elocution to be altogether unworthy of study. Thus, Archbishop Whately, in his disgust at the jerking alternations of ups and downs prescribed in elocutionary rules, counsels students to have nothing to do with rules, but simply to be 'natural.' To be natural, however, is to follow those laws or principles which undoubtedly are to be deduced from the operations of the voice in spontaneous speaking; and these must be studied by all who would be 'natural' in practising the art of reading. In elocution, as in painting and in every art, the highest attainment of the finished artist is to be natural.

Nature and art are not opposites; the former is the *end* of the latter; the latter *means* to the former. To be natural does not 'come by nature,' but by art; and 'art itself is nature.' Elocution, therefore, is none the less 'natural' that it must be studied as an art; and the study of this art is not justly to be condemned, whatever condemnation may be due to the errors of elocutionists.

To acquire a natural style of reading, the chief point to be attended to is the logical clausuring of sentences, so as to present, with separate completeness to the hearer's mind, every fact and every associated circumstance, whether principal or subordinate. Punctuation is not a sufficient guide for this purpose; it will sometimes even mislead. Thus, in the following sentence from Macaulay's *Essay on Milton*: 'Even when a system has been formed, there is still something to add, to alter, or to reject'—the logic of the sentence is not brought out by the punctuation. The reader should make a modulative break after the word 'something,' where no comma is placed, and he should, notwithstanding the separating commas, unite the three subsequent clauses by a modulative tie, to show their expletive nature, and the equal relation of each of them to their common antecedent. Thus: 'There is still *something* | to add, to alter, or to reject.'

In the following sentence from the same *Essay*, no comma occurs, but the reader will nevertheless divide the period into at least three modulative clauses: 'The blaze of truth and liberty | may at first dazzle and bewilder | nations which have become half blind in the house of bondage.' Here the first section contains the *subject* of the sentence, the second the *predicate*, and the third the *object*, with its dependent clauses. It is to be observed that the object 'nations' is separated from its governing verb 'bewilder,' only because the former is itself the governing antecedent to a new but subordinate sentence.

These illustrations are sufficient to show that the clausuring of sentences for effective reading is dependent on a different principle from that which regulates punctuation.

Nor is any particular mode of vocal inflection necessarily associated with any of the marks of punctuation. This is particularly to be noted in connection with the sign of interrogation. The position of this mark, too, at the end of a period often misleads readers into an unnatural tone. The interrogative part of the sentence may not extend beyond a single clause, and this may be followed by many clauses within the same period. The mark of interrogation would therefore be better placed at the beginning of a sentence. But, as above shown, interrogative language may sometimes require for its just expression any one of all the tones in the gamut of speech. Thus: 'Will you?' if pronounced with a simple rising tone, this question asks or appeals; and with an extended range of inflection, it expresses doubt or surprise. But the form of words does not necessitate the rising tone. Thus: 'Will you?' If pronounced with a simple falling turn, the question expresses desire or expectation on the part of the speaker; and with an extended range of inflection, it conveys more or less of authoritative injunction.

The same question may legitimately, also, take either of the compound forms of inflection. Thus: 'Will you?' If pronounced with a compound rising turn, it infers some cause of opposition or hindrance; and with an extended range of inflection, insinuates more or less of threatening or penalty. With a compound falling tone, thus: 'Will you?' it suggests more or less of defiance and contempt, according to the pitch of the commencing turn, and the extent of the concluding inflection.

The principles of vocal expression, clausal pronunciation, emphasis, &c., as above sketched, apply equally to speaking as to reading; but it is in connection with the latter chiefly that they require to be studied, as they are generally applied instinctively in spontaneous speaking, even by those who are most enslaved by vicious habits in reading. The management of the voice, however, should be more than an instinct to the orator; and there is much in the philosophy of vocal expression that will be studied with equal advantage by both speakers and readers.

Extemporaneous speaking is greatly assisted by a good habit of elocution, and it is at the same time strongly conducive to the

formation of such a habit. The deliberate utterance which weighs every phrase, gives the mind time to revolve its ideas, and choose the most effective words for their expression; and the evolution of a continuous train of thinking in coherent sentences compels deliberation and guarded delivery. But while the grandest triumphs of oratory are thus to be achieved, the requisites for success are such that great orators must ever be few in number. The ancient rhetoricians describe their model speaker as one who is accomplished in all knowledge, and esteemed for every virtue, and who has devoted more than the average duration of human life to laborious preparation; for they held that the oratorical faculty could not attain its full development and influence until hoary hairs had added the venerableness of age to a reputation for learning, sagacity, and unimpeachable morality.

Speaking from memory admits of the application of every possible element of effectiveness, rhetorical and elocutionary; and in the delivery of a few great actors, the highest excellence in this art has been exemplified. But speaking from memory requires the most minute and careful study, as well as high elocutionary ability, to guard the speaker against a merely mechanical fluency and thoughtlessly rhythmical utterance. This mode of delivery is therefore only appropriate to special efforts, for which due preparation can be made. Otherwise, memoriter delivery—as of sermons composed and learned at the rate of one or two every week—is altogether incompatible with excellence either of matter or of manner.

That the art of reading, which is on all accounts worthy of the highest position among the exercises of students for the oratorical professions, should be so utterly neglected in our systems of education, is a reproach to the enlightenment of our age; and it is especially a scandal to our universities, in which the examples of the famous orators of antiquity, and the lessons of their experience, are so fully known, yet practically dishonored.

RE'AL is a phrase much used in the law of the United Kingdom in combination with various other terms. In the law of England and Ireland, real property or real estate, or realty, constitutes one of the great subdivisions of all property, consisting of what is popularly known as land and houses, which are not legal terms; personal property or personalty, includes all the other kinds of property, as goods and chattels, money, &c. The same or a similar distinction pervades the laws of all countries. In the Roman law, things were divided into movable and immovable. In the law of Scotland, the division is into heritable and movable. The division into realty and personalty comes into operation in the event of the death of an owner of property, especially when he dies intestate, in which case his realty goes to the heir-at-law, and the personalty to his administrators or executors. See SUCCESSION. A division also exists in England of actions into real and personal actions, the object of the former being to recover real property, and of the latter to recover damages, or the possession of personal property; while there is also a class of actions called mixed actions, which partake of the nature of both. With regard to chattels, there is also a subdivision into real chattels and personal chattels, the former consisting of contracts and interests affecting real estate, such as leases and mortgages, while personal chattels include corporeal movables. Then there is a division of assets into real assets and personal assets, the former being the real estate, so far as it can be made according to the rules of law liable for the debts of the deceased. In Scotland, the word is also frequently used technically, though not in the same sense as in England. Thus, real actions in Scotland mean actions the object of which is to recover possession of the property itself, whether heritable or movable, and a real right is a right to the property itself in a like sense. A real burden, in the law of Scotland, means the right to a sum of money, or other obligation, so secured on land that the land cannot be sold or alienated except as subject to the burden, and until the burden is discharged.

RE'AL, a silver coin and money of account in Spain, Mexico, and other old Spanish possessions. It is the $\frac{1}{4}$ th part of the piastre (*peso duro*), or $\frac{1}{4}$ th of the *peseta*, the franc of the new Spanish decimal system, and has a value, varying with the exchange, of about 2½d. Of the old Spanish reals now disused, the *real de plata* was the $\frac{1}{4}$ th of the piastre or *peso duro* (see *PIASTRE*); and the copper-real or *real de vellón*, was the $\frac{1}{16}$ th part of the piastre. The real was first coined in Spain in 1497, and has since that time frequently varied in value. At the present day, in Mexico, Peru, and the Central American Republics, the piastre is divided into 8 reals, and silver coins of one real are current, while in Colombia, it is divided into 10 reals, and silver reals and half-reals are coined. The real is also a money of account in Portugal, being the equivalent of 40 reis; and in Batavia, it is the name of a weight for gold and silver articles corresponding to 17 dwts. 14 grains troy weight.

REA'LGAR, a mineral consisting of about 70 parts of arsenic and 30 of sulphur. This native sulphuret of arsenic is of a very

brilliant scarlet color, generally translucent, but sometimes transparent; and occurs in the vicinity of volcanoes, and in many igneous rocks; massive, disseminated, or crystallized. Its crystals are prisms, sometimes needle-like. It yields to the pressure of the nail.

REALISM. See NOMINALISM.

REAL PRESENCE, in the Eucharist, a doctrine forming an article in the belief of the Roman, the Greek, and other Eastern churches, and of some bodies or individuals in other Christian communions, according to which it is held that, under the appearance of the Eucharistic bread and wine, after consecration by the priest, Christ himself is really and substantially present, body and blood, soul and divinity. The word *really* is used in opposition to 'figuratively,' and the decree of the Council of Trent, which is the authoritative expositor of the Roman Catholic belief, conjoins with that word the terms 'truly' and 'substantially,' the former being used in order to exclude the notion of a barely typical representation, such as is recognizable in the Paschal Lamb and the other Messianic types of the Old Law; and the latter for the purpose of meeting the view ascribed to Calvin, that Christ, as apprehended by the faith of the believer, was, for such believer, rendered virtually present in the Eucharist, and that his body and blood were received in virtue and efficacy, although not in corporeal substance. The belief of the Roman and Eastern churches as to the reality of the presence, was shared by Luther, who, however, differed from Catholics as to the mode; and has always been followed also by one school of divines in the Anglican Church, whose doctrine became very prominent in the time of Laud, and has been revived in the late Tractarian movement. But between Catholics and all the non-Catholic schools of whatever class, one marked difference exists. According to the former, the presence of Christ in the consecrated Eucharist is *permanent*; so that He is believed to be present not alone for the communicant who receives the Eucharist during the time of his communion, but also remains present in the consecrated hosts reserved after communion. On the contrary, all the Lutherans, and almost all Anglicans, confine their belief of the presence to the time of communion, and all, with hardly an exception, repudiate the worship of the reserved elements, as it is practised by Catholics.

The question as to the reality of Christ's presence in the Eucharist is quite distinct from that which regards the *mode* of the presence, for which see TRANSUBSTANTIATION.

REAM, a certain quantity of paper, consisting of 20 quires, each quire containing 24 folio sheets. A *printer's ream* should consist of 21½ quires. The word appears to be derived from the Saxon *ream*, a band, and was probably applied in consequence of the bundle of paper being held together by a band.

REAPING, the act of cutting corn, has been performed from time immemorial with an instrument called a reaping-hook or sickle. The sickles in use among the ancient Jews, Egyptians, and Chinese appear to have differed very little in form from those employed in Great Britain. The reaping-hook is a curved instrument of about a foot and a half in length, tapering from a breadth of about two inches at the but-end, where it is fixed into a wooden handle. The edge is sometimes serrated, but, as a rule, it has long been made plain and sharp like a knife. In reaping, the harvester takes the corn in his left hand, and then with the hook cuts the stalks as close to the ground as possible; but when a grass crop has been sown down with the grain, the stubble is often left rather longer, in order to preserve the young grass. The corn is placed handful by handful in a band usually made of the corn, and when as much has been cut as will form a sheaf, it is tied up by the 'bandster.' The most expert reapers slash down the corn with the hook in the right hand, using the left merely to keep the corn from falling, until sufficient to make a sheaf has been cut, when the reaper places his hook under the corn, and supporting it with his left arm, deposits it all at once in the band. A bandster (one to every three or four reapers) binds the grain, and sets it up in stooks of generally 12 sheaves. It was surprising to see women of sixty years and upwards, handling the 'hook' with great dexterity, accomplishing their 20 and sometimes 24 stooks of 12 sheaves each per day. After such a day's work, these women appeared much fatigued, but a night's rest seemed to set them on foot, vigorous as ever. They divested themselves of much of their clothing, and really worked hard for their money.

In the principal corn-growing districts of Scotland, a great proportion of the reaping by hand was at one time done by laborers from Ireland, who undertook the work at from 8s. to 15s. per acre, with board and lodging in addition. Their fare was of the simplest kind—consisting in the majority of cases, of porridge morning and evening, and bread and beer for dinner; their lodging at night was the barn or some outhouse, the farmer providing coarse blankets for covering. The quantity of porridge consumed at each meal by those people was sometimes astonishing—no less,

as has been proved by actual weighing, than 5 lbs., with 1½ lbs. of milk besides. In England, most of the corn was cut by piece-work, at prices varying from 10s. to 18s. per acre. On the stronger lands of the midland and southern counties, the stubble is sometimes left knee-high, and afterwards at leisure cut by the scythe, or with a long hook, at a cost of 2s. per acre. In Yorkshire, Derbyshire, Oxfordshire, and on many of the lighter soils in other counties, the operation of faggotting or hacking, to be afterwards noticed, was preferred as being more expeditious than reaping. A good hand cut down from one-third to one-half of an acre of wheat, and often consumed, during his long day's labor, two gallons of good ale.

The scythe in some counties, more than thirty years ago, was preferred to the sickle. The most common varieties were: the Hainault scythe—an importation from Belgium—the cradle scythe, and the common scythe fitted with a cradle. The Hainault scythe consists of a blade about 2 feet 3 inches long, having a handle 14 inches long. This the mower holds in his right hand, while in his left he carries a hook, with a handle of about equal length. 'The reaping,' says the late Mr. Henry Stephens, in his *Book of the Farm*, 'is done by pressing the back of the hook with the left hand against the standing corn, in the direction of the wind, and by cutting with the scythe close to the ground against the standing corn with a free swing of the right arm,' the hook keeping the cut corn from falling until a sufficient quantity to form a sheaf has been cut. This operation was practised in many parts of England, and especially on the lighter soils, under the name of faggotting or hacking, the reaper sometimes using in his left hand, instead of the hook, a stout crooked stick from 2½ to 3 feet long. Beans and oats were the crops most generally fagged.

The cradle scythe is composed of a blade about 8½ feet long, attached to a principal helve or sned about 4 feet long, into which another helve of about 2½ feet in length is tenoned, thus making two handles. The cradle or bow is a piece of wood joined to the heel of the blade, into which are inserted three or four wooden teeth, in a line with the blade, the object of which is to secure the grain being laid evenly in one direction. As skill at the working of the scythe, however, increased, the cradle or bow was discarded in many cases. By the scythe, corn can be cut at a rather less cost per acre than with the hook; but the work is not so neatly done. As nice a stubble will be left by a good hand with the scythe, and often nicer than by the hook, but the sheaves are not, as a rule, so tidy after the scythe, though they will stack rather earlier. Of a fair working crop, an adept at the scythe would cut 2 or 2½ acres per diem. The average area cut per day with the scythe does not exceed 1½ acres. In fact, if the crop is heavy, that extent is a very hard day's work. Those who contract for cutting the crops by the scythe, obtain the services of the best men, and thus generally get about 2 acres per day reaped, and reaped very well too. In the midland and southern counties of England, the scythe, long in general use, was of larger size, and had only one long shaft, on which were fixed two handles. In Bedfordshire, Hertfordshire, and some of the eastern counties, the whole of the cutting, until the introduction of reaping-machines, was done by these scythes. The harvest operations then, from the cutting of the crop to the thatching of the ricks, cost from 18s. to 25s. per acre.

The process of reaping with either the sickle or the scythe is, however, both tedious and expensive; and hence, during the last three-quarters of a century, many attempts have been made to accomplish the work by machinery—attempts which, in the course of the last twenty years, have been crowned with complete success. Reaping by machinery, however, is no modern invention. Pliny the elder, who was born in the 1st c. of the Christian era,

Fig. 1.—Ancient Reaping-machine.

found a reaping-machine in Gaul. He says: 'In the extensive fields in the lowlands of Gaul, vans of large size, with projecting teeth on the edge, are driven on two wheels through the standing corn by an ox yoked in a reverse position. In this manner the ears are torn off, and fall into the van.' Palladius, about four centuries later, found a similar appliance for reaping corn in Gaul. He gives a more detailed but similar description of the machine. The annexed cut, copied from Mr. Woodcroft's *Appendix to the Specifications of English Patents for Reaping-machines*, represents what is conceived, from the descriptions, to have been the form of this ancient reaper.

In modern times, the idea of a mechanical reaper appears to have originated with a Mr. Capel Lloft, who, in 1785, suggested a machine something after the pattern of the ancient one above described. Between that time and the Great Exhibition of 1851, in London, from which the general use of mechanical reapers may be said to date, the patents taken out for reaping-machines were very numerous. Among the most promising of these may be mentioned those of Mr. Gladstone of Castle-Douglas; Mr. Smith of Deanton; Mr. Kerr, Edinburgh; Mr. Scott of Ormiston; Mr. Dobbs, an actor in Birmingham; Mr. Mann of Raby, near Wigton; and the late Rev. Patrick Bell of Carmyle, Scotland. In 1826, Mr. Bell constructed an efficient and simple machine, which long continued in use, and several features of which are observable in the reapers of the present day. The inventor of this, the first machine of the kind in Scotland, received a public testimonial from agriculturists, in consideration of the services he thus rendered to agriculture. In America Mr. Hussey and Mr. McCormick took out patents for reaping-machines of superior character in 1833 and 1834 respectively.

The movements of the cutters of these machines were various. A few were advancing only, some sidelong and advancing, others reciprocating and advancing, a large number continuous and advancing, and others continuous and alternate. The reciprocating and advancing motion is that now employed on the machines in use. The principal difference in the machines now so largely used for cutting corn is in the form and character of the cutters, and in the mode of delivering the grain after it is cut.

The cutting-knives are of two kinds—one, obtuse-angled and serrated; the other, acute-angled and for the most part plain. Both are attached to a bar, and are made to work through another bar of iron fitted with hollow fingers, called guard-fingers, which, projecting forwards, catch the standing corn, and retain it firmly until it is cut. The serrated knife saws through it; the plain knife clips it, as it were; the finger-guard forming the fixed blade of the scissors.

The delivery of the sheaves is effected either by manual or mechanical labor; but the vast proportion of the machines in use are what are termed manual delivery-reapers. The delivery of the sheaves by manual labor is now almost at the back of the machine, the side delivery being generally abandoned, unless in the self-deliveries. In delivering the grain, a man, with a short-handled rake in his hand, sits upon the machine almost opposite the cutting apparatus. With this he inclines the grain towards the knife: and when sufficient to make a sheave has been cut, he rakes it off the platform upon the machine, on to which it has fallen, and deposits it on the ground. The cut subjoined will illustrate the method of raking off. In making a neat and squarely-formed sheaf, the raker is greatly assisted by a hinge in the platform, which enables him, by pressure of the foot, to tip the board over, so as to let the corn slide gently down.

With the back-delivery, the sheaves must be tied up and removed out of the way of the machine before it comes round again. Such a reaper, therefore, always requires a full supply of hands to attend upon it. But it is the best for all that. It does require

Fig. 2.—Hussey's Reaping-machine (cutting part).

a skilful, careful man to 'tilt,' but the fact that the course has to be kept clear for the horses every round, spurs the laborers, who thus do more work than they would otherwise accomplish. Besides, it is a very doubtful advantage to be enabled to slash down the crops irrespective of the gathering capacities. Moreover, with the self-deliveries, it is the distance gone over, and not the quantity of crops collected, that regulates the size of the sheaf. With uneven crops, this is an inconvenience. Sheaves of different sizes are very troublesome in the stock. They will not stand well, and in stacking it is difficult to keep uniformity in building. Large and small sized sheaves are not equally dried, and are not ready for stacking at the same time. Eight people 'lifting' after the manual-reaper will do as much work as nine following the self-delivery, so that the saving of a man's labor claimed by the self-delivery is doubtful. The sheaves are rather better formed by the manual machine than by the self-delivery. Each kind,

has, however, and will likely continue to have its advocates, though the preponderance is in favor of the manual.

The mechanical or self-delivery machines, as they are generally called, are of two kinds—one lays the cut corn in swaths, the other deposits it in sheaves. The latter is decidedly the best and most fashionable of the two.

The automaton sheaf-deliverers best known to the public are those of Samuelson of Banbury; Hornsby and Son; Burgess and Key; Brigham and Bickerton, Berwick; Howard and Co., Bedford. We give a description of Samuelson's sheaf-deliverer

Fig. 3.—Samuelson's Self-delivery Reaping-machine.

(largely used in Great Britain), which will be made plain by the accompanying cut. The self-delivering machinery consists of a series of four rakes—two toothed, and two plain—attached to an upright shaft, in such manner as to admit of a free ascending, descending, and horizontal motion. The two toothless rakes, or 'dummies,' are shorter in the arms by six inches than the other two, and are merely employed to incline the grain towards the cutter. The platform upon which the grain falls after it is cut is of quadrant shape, and is surrounded, on the outer edge, by a rim of about a foot deep. The side of the *cam* next the platform is bent or depressed, so that the rakes on reaching this point, make a sudden fall, or eccentric motion, thus assuming the horizontal attitude necessary to sweep over the platform on the level. The rakes are adjusted so as to lay the sheaves about 12 feet apart, to the side, and out of the way of the horses. This machine has a double-throw knife—an arrangement which reduces the driving speed, and consequently the wear and tear of the machinery.

In McCormick's automatic delivery-machine, a rake is so used that 'during one part of the revolution of the gathering-reel, it acts as one of the vanes of the reel in bending the standing corn to the cutting-blades. When the rake reaches the cutting-blades in front of the platform, it ceases to revolve around the reel-shaft (which continues its rotary motion), and is made to move horizontally upon a vertical hinge, to which one end is attached (the points of the teeth being near the surface of the platform), sweeping the cut corn off at the side, and depositing it on the ground in sheaves ready for the binder.' The Messrs. Brigham and Bickerton's improved machine has a deep upright board of sheet-iron to keep the corn on the platform. Iron rods on these sheets separate the corn. This firm has thrown off two branches lately. The first offshoot was Messrs. Lillie and Elder, and the last was Bickerton and Co. The three firms make good serviceable reapers. Howard and Hornsby's reapers are substantially and simply constructed, embracing slight improvements every other year, formed on experience. Prices range from £20 to £35.

The makers of manual delivery-machines are numerous, including in a prominent degree Kemp, Murray, and Nicholson, Stirling; Jack and Sons, Maybole; Harrison, Macgregor, & Co.; Picksley, Sims & Co.; Ransome, Sims and Head, Ipswich; Samuelson & Co., Banbury; J. and F. Howard, Bedford; and many others of fame. The manual delivery-machines of the first named firm are very popular, strong and ingeniously manufactured, while those of the Maybole firm are not quite so strong, but work with great ease and tastefulness. Carefully handled, the manual delivery-reaper will take up laid and twisted crops admirably. Indeed, all the reapers nowadays, perfected as they are year by year, now do their work remarkably well, leaving a beautiful stubble and a nice sheaf. The sheaves from the reaper, however, are not so easily dried for the stackyard as those from the scythe, but they defend rain better, and are altogether preferable. The number of reapers now in use in Great Britain is enormous, and is growing rapidly every year. They are a most decided improvement. Indeed, they are one of the most valuable introductions that have been made in rural agriculture in this country. At almost every farm of ordinary or even comparatively small dimensions, there is a reaper, and three or four engaged on the larger holdings. The cost of the manual delivery ranges from £18 to £30.

The cost of reaping by machinery is much less than either by

scythe or sickle. Mr. Wilson of Woodhorn, Morpeth, found that the cutting of wheat with the sickle (binding and stooking included) cost him from 11s. to 15s. per acre, and with the scythe 8s., whilst with the machine it only cost him 5s. 9d., exclusive of wear and tear. From data supplied by a large number of their customers, Messrs. Samuelson & Co. make out that the saving by mechanical over hand labor is, as compared with reaping, 4s. per acre, and with mowing, 1s. 9d. per acre; and most farmers who have tried reaping-machines set down the saving at from 20 to 30 per cent. Besides, there is about a like economy in time, which is of immense importance in a variable climate like that of Great Britain.—See Woodcroft's *Appendix to Patents for Reaping-machines*; Mr. Jacob Wilson's 'Essay on Reaping-machines,' in *Transactions of Highland Society* for January 1864; *Book of Farm Implements*, and *Book of the Farm*, by Henry Stephens; J. C. Morton's *Cyclopædia of Agriculture*.

REASON, REASONING. The word Reason denotes that function of our Intelligence having reference to the attainment of a particular class of truths. We know a great many things by immediate or actual experience. Our senses tell us that we are thirsty, that we hear a sound, that we are affected by light. These facts are truths of Sense, or of immediate knowledge, and do not involve the reason. Reason comes into play when we know a thing not immediately, but by some indirect process; as when, from seeing a river unusually swollen, we believe that there have been heavy rains at its sources. Here the mere sense tells us only that the river is high; it is by certain transitions of thought, or by the employment of our thinking powers, that we come to know the other circumstance, that in a remote part of the country there have been heavy rains.

In ascertaining these truths of reason, or of Inference, as they are called, there are various steps of operations, described under different names. Thus we have (1), **DEDUCTION**, or **SYLLOGISM**; (2), **INDUCTION**; and (3), **GENERALIZATION** of Notions, of which **ABSTRACTION** and **DEFINITION** are various phases. These are described under their several designations. The nature of the function or faculty denominated Reason or the Reasoning Faculty, can be explained by showing how it results from the fundamental powers of the Intelligence. See **ASSOCIATION OF IDEAS**.

There is another and peculiar signification attached to the word Reason, growing out of the philosophy of Kant. He maintained the existence of certain principles or cognitions *à priori*, or of intuitive origin, and not derived from experience, such as cause and effect, the axioms of mathematics, &c. See **COMMON SENSE**. It was a function of the reason, according to him, to recognize those principles; while the generalizations of mere experience, as that water extinguishes fire, were proved by the Understanding. Other philosophers give the name 'Noetic faculty' (Greek, *noûs*) to the same function. Hamilton calls it the 'Regulative faculty.'

RÉAUMUR, RENÉ ANTOINE FERCHAULT DE, a celebrated naturalist and physicist, was born at La Rochelle, in the department of Charente-Inférieure, France, 28th February 1683; and studied in the Jesuits' College at Poitiers, and afterwards at Bourges. With an eye observant of facts of every kind, and an indiscriminate thirst for information, he yet specially devoted his attention to physics, natural history, and mathematics. In 1703, he went to reside at Paris, where he speedily attracted general attention by the publication of three geometrical Memoirs on particular cases of the intersection of lines; and in 1708, he was elected a member of the Academy of Sciences, and was charged with the supervision of the work *Description des divers Arts et Métiers*, published under the auspices of the government. R. lightened his labors with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, gold-bearing rivers, and turquoise mines of France. His investigations into the nature of the turquoises of Languedoc led him to the discovery, that they consisted of the fossil teeth of extinct animals. The collections of memoirs of the Academy of Sciences from 1722 till 1725 contain a number of papers by R., in which he details his discoveries of the mode of producing steel from iron (an art till that time unknown in France), of the tendency which fused metals have to become crystallized, and of the mode of tinning iron (also till that time unknown in France). For these brilliant and valuable successes, he received from the French government a sum of 12,000 livres, which he spent in promoting and encouraging the industrial arts in his native country.

R.'s volatile genius next prompted him to take up the subject of pottery; and here also his ingenuity and perseverance were rewarded with success, for though he failed in successfully imitating the porcelain of China, he succeeded in producing (1739) an opaque glass, which was equal to the porcelain of Saxony and Japan. All this time, he occasionally pursued his studies in natural history, at one time propounding a mode for preserving eggs (by coating them with fat), at another giving directions for the production of fowls by artificial incubation. His invention

of the *Thermometer* (q. v.) which bears his name need not be more than mentioned here. He died of a fall from a horse at his estate of Bermondière, in the department of Maine, 17th October 1757, leaving behind him a voluminous collection of works on all the subjects above stated, also a treatise on 'the silk of spiders,' which was translated into Manchu by the command of the Emperor of China; and a number of Memoirs (1731—1740), containing his thermometric researches on air, and on mixtures of fluids with fluids or solids. But by far his most important work is the *Mémoires pour servir à l'Histoire des Insectes* (Amsterdam, 12 vols. 1737—1748), which embodies a number of original observations and discoveries concerning the habits and instincts of insects, sufficient of itself to immortalize their author. Only six volumes of this work have been published, the seventh being very incomplete at the period of the author's death. While collecting materials for this great work, he kept numerous insects of all kinds in his garden, in order to have every opportunity for observing them. The Academy of Sciences obtained, by the terms of R.'s will, his collections of minerals and plants; materials for a History of Quadrupeds and Birds, afterwards made use of by Brisson and Buffon; a History of Arts, in MS.; and an immense number of finished and unfinished MS. Memoirs.

REBA'TE, a longitudinal groove, cut in a piece of timber, to receive the edge of another piece, or the ends of a number of

Rebate.

pieces of wood. A notch, such as that in a door standard for a door, as in the fig., is also called a rebate. In Masonry, such a joint is called a joggle.

REBA'TED, in Heraldry, having the points broken off or cut short.

RE'BEC (anciently *rubibe*, or *rebelle*, Arabic, *rébab*), an ancient musical instrument of the violin kind, of which the body, instead of consisting of two hemispherical enlargements, like other instruments of the same tribe, was narrow towards the neck, and gradually enlarged till it rounded off at the lower end. It had a bridge and three strings tuned in fifths, and was played with a bow. The earliest known representation of the rebec, however, taken by the Abbé Gerbert from a MS. of the 9th c., gives it but one string. The Moors introduced this instrument from the East into Spain, whence it spread over the rest of Europe, and was the precursor of the violin. The four classes of rebecs, treble, alto, tenor, and bass, were favorite instruments of the minstrels of the middle ages, and were used both for the dance and to accompany street-singing. Milton, in his *L'Allegro*, characterizes the instrument as the 'jocund rebec.'

REBE'LLION (Lat. *rebellio*, from *bellum*, war, a revolt by nations subdued in war), an openly avowed renunciation of the authority of the government to which one owes allegiance, or a levying of war to resist the authority of the government. Unlike insurrection, which may be merely an opposition to a particular law, rebellion involves a design to renounce all subjection to the state. A *commission of rebellion* is a commission awarded against a person who treats the sovereign's authority with contempt, by not obeying his proclamation according to his allegiance, and refusing to attend his sovereign when required. It consists of four commissioners, who are ordered to attack the rebel wherever found. In Scotland, by legal fiction, a debtor disobeying a charge on letters of horning to pay or perform in terms of his obligation, was accounted a rebel, as being disobedient to the sovereign's command contained in the writ. This disobedience was called civil rebellion, and the penal consequences of actual rebellion followed it, until they were abolished by 20 Geo. II. c. 50. By the old form of diligence (which is still competent), it has therefore been said that debtors were imprisoned not for debt but for rebellion. The fiction was discarded in the provisions of the statute 1 and 2 Vict. c. 114, simplifying the form of diligence and the steps by which imprisonment for debt is effected.

The expression 'The Great Rebellion,' is generally applied in England to the revolt of the Long Parliament against the authority of Charles I. It began with the votes of the two Houses regarding the militia in 1642, by which they endeavored to seize the military power of the country, and the departure of the king for York, which was immediately followed by the breaking out of hostilities. The civil war was, properly speaking, terminated by the submission of Charles to the Scots, in April 1646; but the period of the rebellion is usually held to include the Commonwealth or Protectorate, and to extend to the restoration of Charles II. in May 1660.

The revolts in behalf of the House of Stuart in 1715 and 1745 are often, particularly in Scotland, spoken of emphatically as 'The Rebellion.' The former rising in favor of the Chevalier de St. George, son of James II. of England, called the Old Pretender, was headed by the Earl of Mar, and put down in 1716; the latter was led by Prince Charles Edward, known as the Young Pretender, who, landing in the Hebrides, was joined by the Highland chieftains and numerous followers, and after taking possession of Edinburgh, and marching to Derby, retreated into Scotland, and was defeated with great slaughter by the Duke of Cumberland at Culloden, on the 16th of April 1746.

REBUS, an enigmatical representation of a name or thing by using pictorial devices for letters, syllables, or parts of words. The term probably originates from the device speaking to the beholder *non verbis sed rebus*. Devices of this kind, allusive to the bearer's name, were exceedingly common in the middle ages, particularly in England. In many instances, they were used by ecclesiastics and others who had not a right to armorial ensigns. Thus, on the rector's lodgings at Lincoln College, Oxford, erected in the 15th c., to which Thomas Becketyngham, Bishop of Bath and Wells, liberally contributed, is carved the rebus of that prelate—a becon and tun, with T, the initial letter of his Christian name.

In Westminster Abbey, Abbot Islip's chapel gives two forms of his rebus—one, a human eye, and a small branch or slip of a tree; the other, a man in the act of falling from a tree, and exclaiming, 'I slip!' Many of the monograms of the artists of the middle ages and early printers were rebuses. That of Ludger von Ring was the letter L inserted into a ring. A large proportion of the early coats of arms were rebuses on the names of the bearer of them, as, for example, three salmon for the name of Salmon, a lock and heart for that of Lockhart, three skenes or dirks for Skene. Family badges are also frequently of the nature of a rebus, and mottoes, as *Ver non semper vires* of the Vernons.

RÉCAMIER, JEANNE FRANÇOISE JULIE ADELAIDE BERNARD, DAME, perhaps the finest representative specimen, in later times, of that character peculiarly French, the 'woman of society,' the potentate in petticoats, who sways the *salon*, and out of it becomes in doing so a sort of 'unacknowledged legislator'—was born at Lyon in December 1777. Her father was a banker of that city, and, as well as her mother, was distinguished by much of the personal grace and charm which, in the daughter, seem to have culminated, as it were, in a form of almost typical perfection. She was beautiful, and in rare measure possessed, as the soul of her beauty, the woman's indefinable fascination, the *je ne sais quoi* of her country. She was educated under the charge of an aunt in the convent of La Déserte; and at about the age of 15, she went to Paris to join her parents, who had some time before migrated thither. Shortly after, she was married to M. Jacques Récamier, a rich banker about thrice her own age. The union is said to have been scarcely in the ordinary sense connubial ('M. Récamier n'eut jamais que des rapports paternels avec sa femme'); but a mutual affection and respect informed it from the first, and consecrated it to the end, as passion might possibly have failed to do.

A record of the splendid social triumphs of Madame R. would involve notice of nearly all that was distinguished in Paris during a space of about fifty years. In that strange, impalpable, yet most real way, of which, in this country, we can have only a faint and also coarse conception, she became a power, and she continued so; and this despite changes of fortune, which, among us, would have involved the extinction of even a more solid celebrity. To the famous Madame de Staël, she was bound by ties of extreme affection and intimacy; and when her friend was banished from Paris, as having drawn on her the little jealousy of Napoleon, she lavished her sympathy on the brilliant exile. Sometime after, the complete ruin of her husband's fortunes induced her to accept an invitation from Madame de Staël to join her at Coppet in Switzerland (1806). Here she was thrown into the society of Prince August of Prussia, and a mutual attachment ensued. It is supposed that, of all her innumerable admirers, he alone succeeded in touching her heart. A marriage was arranged, the necessary condition of which was the consent of M. Récamier to a divorce. This was not refused; but his mild and touching remonstrance sufficed to divert from her purpose a woman, on the one hand, of generous and noble feeling, and probably, on the other, constitutionally incapable of any very vehement passion. The man whose brilliant prosperities she had shared, she shrunk from deserting in the decay of fortune which had by this time befallen him. The devotion of her princely lover continued till his death in 1845; but it does not appear that after his first distinct failure—though he frequently again met his beloved—his efforts to secure her were very vigorously renewed. The lady's genius for love does not seem to have been great; but for friendship, it was almost unexemplified. The most distinguished *ami* of her later years was M. de Chateaubriand, who solaced himself in his peevish decline by an almost daily visit to her. In 1846, he

became a widower, and he then wished to marry Madame R., a widow since 1830; but the lady declined the honor—wisely for herself and for M. de Chateaubriand. Till the last day of Chateaubriand's life, he found—though his hand had been refused by her—in the friendship of Madame R., almost his only source of cheer and satisfaction.

Chateaubriand died July 4, 1848, and Madame R. followed him on the 11th May 1849. She died not so much of grief as of cholera, a disease of which her dread had always been great; and dying, she left behind her a reputation which must continue to give her a historic place among the French Queens of Society. If not quite so brilliant as some of them, she was obviously much more correct than most, on a ground of virtue or of coldness. Specially brilliant she was not; but she seems to have moved in some atmosphere breathed about her of bewildering charm and fascination. Passion, in its fiercer sense, she had not in herself, nor does she seem much to have inspired it; but the genius of refined *philandering*, as it is termed, was probably never more exquisitely embodied. See *Souvenirs et Correspondance tirés des Papiers de Mme. Récamier* (Par. 1859).

RECANA'TI, a town of Central Italy, in the province of Macerata, on the Musone, 14 miles south from Ancona. It is a station on the railway between Ancona and Rome. R. was a powerful military position in the 11th century: great privileges were bestowed on it by the Emperor Frederick II. in 1229, when the whole line of coast from the Potenza to the Munsone was granted to it for the erection of a port. Pop. above 6000.

RECEIPT is the technical as well as popular term signifying a legal acknowledgment of money received in discharge of a debt or demand. It is often popularly believed that a written receipt is the only legal proof of payment; but this is a mistake, the fact being that it is only one mode of proving it. If the money be paid in the presence of witnesses, or even without witnesses, provided a jury or judge believe the statement on oath of the party paying it, this, in England, quite as good evidence of the payment as if a written receipt were given; and even a written receipt is not conclusive, for it is subject to explanation, and if it was obtained in advance of a payment which never followed, or by fraud, it goes for nothing as a discharge of the debtor. If a receipt is in writing, and the sum paid exceeds 40s., it must be stamped with a penny receipt-stamp (which may be an adhesive stamp), otherwise the receipt is inadmissible as evidence of payment.

Not only is a receipt proper subject to stamp-duty, but also any note or memorandum given to a person on payment of money, and acknowledging payment of any part of a debt or demand, whether signed or not; so receipts given on payment of bills of exchange or promissory-notes, are liable to stamp-duty. But there are several exceptions from liability to stamp-duty. Such are receipts for deposits with bankers (except when paid on allotment of shares, or in respect of calls on shares); receipts as to the assessed taxes—for land-tax, income-tax, and payments to the crown; receipts by officers, seamen, marines, or soldiers for wages or pay; receipts for purchase of government stock; receipts written on the back of duly stamped bills of exchange or promissory-notes, or upon the back of duly stamped purchase-deeds. Where a debtor tenders money, but requires a stamped receipt at the same time, he ought to provide himself with paper, and stamp, and writing materials, for the creditor is not bound to supply these. In Scotland, the receipt of money cannot be proved by witnesses, where the debt was created by writing, and it is not allowed to dispute the validity of a written receipt, except in cases of fraud.

RECEIVING STOLEN GOODS is a criminal offence, distinct from larceny. It implies that the goods were received with the knowledge that they were stolen. The offence is felony, and punishable with penal servitude from 3 to 14 years; or 2 years' imprisonment, with or without hard labor. In cases where the stealing is only a misdemeanor, then the receiving is also only a misdemeanor, and where the taking of property is an offence punishable on summary conviction, the receiving with knowledge is punishable in the same way. It is sometimes extremely difficult to distinguish between the case of a receiver and of one who is a party to the stealing, or a principal. The thief may be a witness against the receiver.

RECENT or HUMAN PERIOD, in Geology, is the title given to the epoch that has elapsed since man made his appearance on the globe. The causes that operated throughout the ages of geological time to produce the changes recorded in the various sedimentary deposits, did not terminate with the beginning of human history, but have been ever acting since man was able to observe and to record his observations, and are still in progress around us. The solid earth is being washed away by atmospheric agency, and the abraded portions are continually carried away slowly and imperceptibly by streams and rivers, to form new deposits in the depths of inland lakes or of the ocean. Volcanoes

are throwing up lava and scorïæ, and earthquakes are elevating portions of the earth's surface in one place, and depressing them in another; and plants and animals are, either with their living bodies or their dead exuvie, forming, as in past ages, deposits in various places, as in the foraminiferous ooze of the deep ocean, and the enormous coral reefs of the eastern seas, or the peat-mosses and diatomaceous earths of temperate climes. The record of all these changes, and the remains of man and of the plants and animals which the strata produced by them contain, have for some years received great attention. As they form common ground for the antiquary and geologist, they have been diligently investigated by the students of both sciences. The classification adopted for the subdivision of the Recent Period is based on what is supposed to have been the progress of human civilization. The first rude inhabitants of a country seem to have been acquainted only with stone implements. Their hammers, knives, and spears were made of stone, sharpened by chipping the edges, and subsequently by grinding and polishing. In Denmark, these stone implements are found buried in peat-mosses, associated with the remains of plants and animals that still live in that or neighboring countries.

The common tree in these mosses is the Scotch fir, which has not been a native of Denmark during historical times. Of the same age are the 'kitchen-middens,' found on the coasts of the Danish islands in the Baltic. They are mounds of the shells of the oyster, cockle, periwinkle, and other edible mollusca, like those formed by the North American Indians on the eastern shores of the United States. The implements found in them are formed of stone, sometimes of wood and bone, but never of metal. Similar 'middens' have been described as occurring in various places in the north of Scotland. The people who built the earliest of the lacustrine habitations of Switzerland were also unacquainted with the use of metals. See CRANNOGES. The paucity or almost absence of human bones in such early deposits, whether in Denmark or Switzerland, is attributed by antiquaries to the supposed practice of burning the dead.

While the lower portion of the Danish peat-mosses is characterized by the presence of stone implements and the trunks of Scotch fir, the upper portions of the same mosses abound in trunks and acorns of the common oak, and with these are associated implements and articles of bronze. In many of the Swiss pile-buildings, the bronze implements also supplanted those of stone. The various articles exhibit a considerable advance in civilization, as is to be expected from the using a metal, the possession of which implies the existence of foreign commerce, since it was in ancient times only obtained from Cornwall.

In progress of time, the oak in its turn disappeared from the surface of Denmark, and was followed by the beech, which still continues to flourish luxuriantly in Denmark. The use of bronze also gradually gave way before the now discovered iron. A few of the lake-buildings seem not to have been abandoned until after the inhabitants became acquainted with the use of iron, as some articles made of this metal have been found at Nidau.

While it is useful thus to characterize the various steps in the civilization of man, and to associate them with the strata in which they occur, it would be a source of endless error to suppose that all such strata are contemporaneous; for the various ages have really existed at the same time not only in different countries of the world, but even in contiguous regions, and probably implements of the three materials have been used at the same time by different inhabitants of the same district. See BRONZE, AGE OF. The occurrence, then, of stone implements in several deposits exhibits not a similarity of age, but a similar stage of advancement in civilization, consequently no dependence can be placed on those calculations which trace back the iron, bronze, and stone periods as if they had preceded each other in regular chronological series, and each had occupied a given number of years.

RECE'PTACLE, in Botany, the expanded and abbreviated termination of a floral axis, bearing many flowers close together, as in the heads of flowers of the *Compositæ* and in the fig. The receptacle assumes a great variety of forms, and sometimes as in the fig, becomes a chief part of the fruit. It is the eatable part of the artichoke, and the 'cheese' of thistles, so well known to school-boys. The name receptacle is sometimes also given to that part of a single flower from which the whorls of floral envelopes and parts of fructification, or some of them spring; which, however, is more properly called the *thalamus* or *torus*.

RECE'PTION, RELIGIOUS, of monks, nuns, and other religious persons, is the ceremonial whereby they are admitted to the probationary state called the Novitiate (q. v.). Before the ceremony of reception, a short preparatory stage must be passed through by the candidate (called at this stage a 'postulant'), the duration of which usually ranges from two to six months. The ceremony of the reception, called also 'clothing,' is performed by a bishop, or a priest delegated by a bishop, and consists in blessing the religious dress or habit, and investing the postulant therein with

appropriate prayers, the hair being at the same time cut off, and the secular dress laid aside, in token of the renunciation of the world and its pomps and pleasures. The reception, however, is understood to be only a provisional step; and the novice remains free to return to secular life at any time during the novitiate.

RECI'PROCAL (Lat. *reciprocare*), a term which is employed in Mathematics in a sense analogous to that attached to it in ordinary language. A geometrical proposition is the reciprocal (or *inverse*) of another, when the 'data' of the one are the 'quæsitæ' of the other, and *vice versa*. In Algebra, one quantity is the reciprocal of another, when the one is the result of unity divided by the other; thus, 2 and $\frac{1}{2}$, x and $\frac{1}{x}$, and $(1 \div \frac{a}{b})$ or $\frac{b}{a}$, are reciprocal quantities. The product of a quantity by its reciprocal must always be unity. *Reciprocal or Inverse Proportion*, a term formerly much used in arithmetical treatises, but now, and with much propriety, generally disused, referred to such questions as the following: If a rectangular field be 800 yards long, and 240 broad, what must be the breadth of another rectangular field of equal area which is 960 yards long?—the answer being 200 yards. In this question, we see that the breadths are not proportional to the lengths, but to the reciprocals of the lengths; thus, $\frac{1}{800} : \frac{1}{960} :: 240 : 200$; but in all such problems, it is better for the pupil to be left to exercise his judgment in applying to them the ordinary rule of proportion.

RECITATIVE (Ital. *recitativo*, from *recitare*, to recite), a species of vocal composition which differs from an air in having no definite rhythmical arrangement, and no decided or strictly constructed melody, but approaches, in tonal succession and rhythm, to the declamatory accents of language; it is, in fact, as near an approach as possible to speech delivered in musical sounds. Recitatives are not performed in any strict species of time, the length of the notes depending on the singer, who lengthens or shortens them according to the expression required. It is, however, usual to note a recitative in common time, in order to facilitate the reading; and when any part of a recitative is to be performed in strict time, this is indicated by the words *rec. a tempo*. When a recitative is accompanied merely by a few simple chords of an instrument, to indicate to the singer the pitch and the harmony, it is called *recitativo secco*, or *parlante*, declaimed recitative. When the voice is accompanied by a considerable portion of the instruments of the orchestra, either in sustained chords or florid passages, it is termed *recitativo accompagnato*, *strumentato*, or *obligato*. Recitative was largely used in the ancient drama; and is used in the opera to express some action or passion, to relate a story, reveal a secret or design, &c. It is said to have been first introduced in the opera by Emilio del Cavaliere at Rome.

RECLA'I'MING, in the Law of Scotland, means the appeal from a judgment of the Lord Ordinary to the Inner House. The reclaiming days are ten days after judgment, except against interlocutors disposing in whole or in part of the merits of the cause. The step by which the appeal is commenced is a reclaiming note.

RECLU'SE (Lat. *reclusus*, also *inclusus*, shut up), a class of monks or nuns who, from a motive of special penance, or with a view to the more strict observance of Christian perfection, remained shut up from all converse, even with members of their own order, in a cell or other place of strict retirement. This practice was not allowed, except to persons of tried virtue, and by special permission of the abbot; and the recluse was, with due solemnity, locked up in the presence of the abbot or the bishop, who placed his seal upon the door, not to be removed without the authority of the bishop himself. The celebrated medieval theologian, Rabanus Maurus, was a recluse, when elected Archbishop of Mentz. Nuns also were found to practise the same voluntary seclusion, especially in the Benedictine, Franciscan, and Cistercian orders. A rule, specially designed for female recluses was composed by Eldred of Reresby, and is preserved by Holstenius in his *Codex Regularum Monasticarum*, vol. 1. p. 418, and following.—In a wider sense, the name recluse is popularly applied to all cloistered persons, whether men or women, even those who live in community with their brethren.

RECO'GNIZANCE is a kind of judicial bond entered into with a court of record, the object of which is to secure the doing of some act, as the appearance of witnesses at a criminal trial, or the keeping of the peace by one who has threatened or assaulted another. The form of it is thus: 'A B doth acknowledge to owe to our lady the Queen the sum of ten pounds,' or some other sum to be levied of his goods if he fail in the condition endorsed; and then a condition is added, which states that if the thing secured is done, then the recognizance is to be void. This is the mode by which justices of the peace secure the attendance of the prosecutor

and witnesses at the trial of a prisoner who has been committed for trial, or the future good behavior of one who has committed a breach of the peace. If the thing secured is not performed, then the party bound forfeits his recognizance, that is, a debt of the amount specified becomes forthwith due to the crown.

RECOIL. When the charge of gunpowder contained in a gun is fired, the sudden expansion of the powder into many times its former bulk acts with equal force in every direction. The resistance offered by the ball, which moves more or less easily in the bore, being far less than that of the bulky and heavier gun and carriage, the ball is forced to a great distance; but the gun, with its carriage, must nevertheless feel the reaction, and is driven backwards a certain space, ordinarily a few feet. This retrograde motion is called the recoil, and dangerous accidents sometimes take place from it. After the recoil, the gunners have to work the piece back to its former position for the next discharge. In the Armstrong naval gun, and some other modern cannon, the trunnions of the gun are mounted on an inclined plane, up which the recoil drives them, to run down again by their own weight. See also the description of the Moncrieff GUN-CARRIAGE. Other expedients have been tried with greater or less success; among them may be cited a series of solid India-rubber buffers, which, being compressed by the recoil, drove the gun home again on recovering their shape. The gun and shot remaining the same, the recoil is proportionate to the charge.

The recoil of small-arms is known as their 'kick,' and is felt on the shoulder of the marksman.

RECOLLECT (Lat. *recollectus*, gathered together), a name given to the members of certain reformed bodies of monastic orders, whether of men or women, in the Catholic Church. Among orders of men, an offshoot of the Augustinian hermits, which, under Louis de Montoya, in 1530, obtained considerable popularity in Spain, was called by this name, and the order still exists at Medina Sidonia, Leon, and Pamplona; but outside of Spain, this order is better known under the title of the REFORMED FRANCISCANS, who were established in France under Henry IV. and Louis XIV., and spread thence into Belgium, their houses in these countries and Germany becoming so numerous that they reckoned no less than ten provinces. A reform of the Cistercian order of nuns in Spain was called by the same name.

RECONNAISSANCE, RECONNOITRE, the noun and verb expressive of the operation of inspecting a country in which military operation are intended. This duty devolves on the department of the Quarter-master General, and requires the exercise of qualities of a very high order. The officer deputed to reconnoitre is well mounted, and accompanied by a small escort, also well mounted, in order to escape if noticed by the enemy. His duty is to measure every natural feature in his district by eye, or by more accurate measurement when practicable, and to produce a map, showing hills, valleys, streams, canals, plains, woods, &c. He must at the same time note all obstacles; what resources the country possesses to maintain men or horses; what the disposition of the inhabitants, &c. Reconnoitring is necessarily a very dangerous service; an officer so employed has often to resort to disguises, and if taken, runs some risk of being treated as a spy.—A maritime reconnaissance is analogous.

RECORD, as a legal term, is used in the United Kingdom to signify the formal statements or pleadings of parties in a litigation. In general, the rule is well settled that the pleadings which make up the record do not enter into details of the evidence, but merely set forth the conclusions or inferences, leaving the details of evidence to be supplied at the trial before a jury, or, if there is no jury, at the hearing before the judge or court. All the higher courts file the records in the suits, and are called Courts of Record, and one of the incidents of a Court of Record is, that the court or judge can commit for contempt any person who insults the court, or wilfully obstructs the business. A trial by record means that one of the parties has set up some former decision of the court, while the other denies that such a decision ever existed; whereupon, the only mode of solving the question is by producing the record of the former action, and so settling the dispute. In the Courts of Common Law of England, the parties, by the rules of pleading, come to an issue at last, after mutually answering each other, and the issue is either some short point of fact or of law. No intervention of the judge or court is necessary to come to an issue. In Scotland, however, the closing of the record is a formal step which requires the sanction of the judge, who closes the record after each party has said all he wishes to say by way of statement and answer. See also REGISTRATION.

RECORDS, PUBLIC (Lat. *recordari*, to remember), contemporary authenticated statements of the proceedings of the legislature, and the judgments of those higher courts of law which are distinguished as Courts of Record. It has been a subject of much discussion what constitutes a record, and in a looser sense the term record has sometimes been applied to any public document

preserved in a recognized repository. No country is so rich in public records as England. A committee of the House of Commons, in 1837, described the public records of England as comprised under four classes. 1. Independent series of records of territorial surveys at different periods. 2. Series of enrollments, comprising on one roll varieties of distinct entries, classed together according to their formal character. 3. Records of judicial proceedings. 4. Separate documents, as letters, inquisitions, commissions, and privy seals. Act 1 and 2 Vict. c. 94, sets at rest the question what is legally to be held a record, by providing that the word records shall be taken to mean all rolls, records, writs, books, proceedings, decrees, bills, warrants, accounts, papers, and documents whatsoever belonging to Her Majesty, or then deposited, or which ought to be deposited, in any of certain places of custody, which are enumerated.

The oldest existing English records are Tallies in Exchequer, which, down to 1834, continued to be used both for receipts and for simple records of matters of account. They consist of wooden rods, marked on one side with notches, to indicate the sum for which the tally was an acknowledgment; while on the two other sides were written the amount, the name of the payer, and the date of the transaction; and the tally being divided longitudinally, the one half was preserved in Exchequer, and the other given to the person who had paid the money. This rude contrivance, which came down to us from Anglo-Saxon times, was an effectual safeguard against forgery. Parchment is the material on which the greater portion of the records are written; the skins being, in some cases, as in the rolls of the Exchequer and common law courts, attached at the top bookways; in other cases, as the Chancery and Wardrobe, sewed consecutively. Some records are in the form of books, as *Domesday*; others are filed—i. e., each document is pierced with a string or gut passed through it, the whole being fastened together in bundles. A few records are written on paper. The early parliamentary records and statutes are principally in Norman-French, which continued in partial use till the time of Henry V.; all the other great series of records, except those of parliament, are in Latin down to the reign of George II., or later, except during the Commonwealth, when English was substituted.

Public records, which can be traced in germ before the Conquest, gradually expanded under the Norman and Plantagenet kings. They enabled the subject to defend and maintain those feudal rights and privileges which were gradually trenching on royal prerogative, and to protect himself from arbitrary exactions; while to the king they furnished precedents which could not be questioned for his calls of military service and taxation.

The various courts being the king's courts, and following the sovereign from place to place, their earliest receptacles were the royal palaces in different parts of England; but when the higher courts were permanently established at Westminster, 'treasuries,' or places of custody for the records of the different courts, were appointed there. A portion of the public records were, as far back as Henry III.'s reign, deposited in the Tower of London and New Temple; and in the reign of Edward III. the Tower had become a permanent treasury. The parliamentary committee of 1837 enumerated among the places of deposit a room in the Tower over a gunpowder magazine, and contiguous to a steam engine in daily operation; a chapel at the Rolls, where divine service was performed; underground vaults at Somerset House; damp and dark cellars at Westminster Hall; the stables of the late Carlton Ride; and the Chapter-house, Westminster. From the reign of Edward II. downwards, the attention of parliament has often been called to the safe custody and arrangement of the records as an object of solicitude. The fullest examination in recent times was made by a committee of the House of Commons in 1800, whose Report presents far the most comprehensive account of the records in existence. A commission was appointed to go on with the work which the committee had begun, and renewed six times between 1800 and 1831. All the several record commissions directed the commissioners to cause the records to be methodized, regulated and digested, bound and secured, and to have calendars made, and original papers printed; and numerous valuable publications have been issued by the commissioners from time to time. A full investigation into the proceedings of the Record Commissioners was made by a committee of the House of Commons in 1855, since which time annual Reports have been issued by the deputy-keeper of records.

The most important recent statute regarding the custody and preservation of the records is 1 and 2 Vict. c. 49, which restores to the Master of the Rolls that custody of the records which he had originally possessed, but which had for a long time become nominal. That officer is empowered to appoint a deputy-keeper of the records, and in conjunction with the Treasury, to do all that is requisite in the execution of this service. He makes rules for the management of the office, and fixes what fees may be demanded. He allows copies to be made, which, when certified by the deputy and assistant keepers, and authenticated with the seal

of the office, are producible as evidence in courts of law. The Home Secretary directs from time to time such of the catalogues, calendars, and indexes, and such of the records as he thinks fit, to be printed, and sold at prices fixed by him. The act 1 and 2 Vict. c. 94 contemplates the consolidation of all the records in the large receptacle near Fetter Lane, into which, under Sir John Ronilly, then Master of the Rolls, they began to be gradually collected from their different scattered depositories.

Our limits will not allow us to enumerate more than a very few even of the more important classes of records. One class consists of the various territorial surveys, beginning with *Doomsday* (q. v.), and including, among others, the *Rotuli Hundredorum*, *Extenta Manerii*, *Testa de Nevill*, *Pope Nicholas's Taxation*, *Henry VIII.'s Survey*, and the *Survey of the Commonwealth*. Another extensive class belong to the *Exchequer*, including the *Pipe Roll*, or Great Roll of the Exchequer, beginning with the second year of Henry II., containing the yearly accounts of the revenues of the crown, certain and casual; the *Memoranda* and *Originalia* rolls, records of *First-fruits and Tenths*, records of the *Court of Augmentations*, instituted to decide questions regarding possessions belonging to the crown, on the dissolution of the monasteries, and *Placita*, or records of pleadings and judgments. The *Rotuli Curie Regis* contain the record of the proceedings in the ancient supreme court of law; and there are numerous classes of records of the proceedings in all the various courts of common law and in the Court of Chancery.

The record of *Fines and Recoveries* is an unbroken record of the transfer of lands from 25 Henry II. down to 1833, when this species of conveyance was abolished. The *Charter Rolls* are records of charters, of grants of privileges to religious houses, towns, and corporations, and creations of nobility from 11 Edward II. to Edward IV. The *Patent Rolls* are enrolments of instruments written on open (*patentes*) sheets of parchment, having pendent from them the Great Seal, addressed to the lieges in general. The *Close Rolls* are records of such letters under the Great Seal as were despatched closed or sealed up—royal mandates to particular persons for particular purposes, and not intended for public inspection. The *Liberate Rolls* contain writs issued out of Chancery, ordering the payment of money from the Treasury. The *Fine Rolls* contain accounts of fines paid to the king for license to alienate lands, freedom from knight-service, passing or renewal of charters, wardships, safe-conduct, pardons, &c. The *French Rolls*, *Norman Rolls*, and *Gascon Rolls* relate to the affairs of France, Normandy, and Gascony, when held by the English; and the *Rotuli Scotia* to transactions with Scotland. An important class of the records are those connected with parliament, including *Statute Rolls*, *Parliament Rolls*, *Records of Parliament*, and *Statutes* from 1485 to the present time, with the *Journals of the Lords and Commons* from Henry VIII. to the present time, and the *Writs of Summonses* and returns to parliament.

The *state papers* originally sprung from the Privy Council and Chancery, and include the correspondence of the Privy Council, secretaries of state, and other public departments, with miscellaneous domestic papers from the time of Henry VIII. to George II., a mass of correspondence with foreign powers, and an extensive collection relating to ecclesiastical affairs at and after the Reformation. Since 1855, the State Paper Office has become a part of the Public Record Office, and been placed under the control of the Master of the Rolls. Much has been done in the way of calendaring and arranging the contents of this valuable repository, and several volumes of calendars of state papers are being issued yearly to the public.

By the regulations established by the Master of the Rolls, 5th July, 1858, persons desirous of consulting the public records, including state papers, for a literary purpose, have to apply in writing to the deputy-keeper, stating the objects of their search, which, if necessary, may be more fully explained at a personal interview. If the explanation be satisfactory, a permission is issued to inspect and make extracts without payment of fees.

Scotland.—The public records of Scotland were undoubtedly numerous and multifarious as early as 1282; but the more ancient of them were lost by shipwreck in the reign of Edward I. of England. The control of the records has from very early times been intrusted to the Clerk Register, or Lord Clerk Register, one of the high officers of state, who had a seat in the Scottish parliament, to whom, and his deputies and other officers appointed by him, it was assigned to superintend both their formation and their custody. The earliest records of Scotland were in the inconvenient form of rolls, but in the reign of David II. the practice was introduced of writing them in books. By an act of 1463, the king's rolls and registers were appointed to be put in books; but the accounts in the Exchequer continued, nevertheless, to be kept in rolls till the passing of another act in 1672, appointing them to be written in books. Prior to the reign of Charles II., the public records were deposited, under care of the Clerk Register, in the Laigh Parliament House, now part of

the Advocates' Library; and shortly before the Union, the whole records were transferred to that depository, where they continued till the erection of the large building called the General Register House, which was completed in 1787, and has recently been added to. The Register House serves the purpose of preserving and making available the national monuments, as well as accommodating the whole offices of record connected with the supreme court. The Lord Clerk Register and his depute have now merely the *custody* of the records, their preparation being intrusted to another class of officers.

Under the Scottish records are included the acts of parliament and of Privy Council, and the records of all the various courts of justice; also the records of the Great Seal, Privy Seal and Signet. An important class of records are the *Retours of Services*. A service is by the law of Scotland necessary to transmit a right to real property to the heir from his ancestor. At present this service consists of the decision of the sheriff of the county or the sheriff of the Chancery; but the form in use till 1847 was by retour, a writing which contained the verdict of a jury returned in answer to a brieve from Chancery for finding the heir at the death of his ancestor. The register of retours is not extant further back than 1547.

The registers connected with the transmission of heritable rights are even more important. After several unsuccessful attempts to introduce a system of registration, the great branch of the public records known as the *Register of Sasines* was established by act 1617, c. 16. By the system then introduced, which has since been continued with modifications in detail, all instruments requisite to the transmission of real property must be put on record for publication. Besides the principal register in Edinburgh, there are district registers, and any instrument may be recorded either in the general or district register. Volumes are issued from the General Register House to the district recorders of sasines, which, when filled, are returned to the General Register House. By this means the title to real property can be ascertained with certainty and precision, and may, if necessary, be traced back two centuries and a half. It is also obligatory to record in separate registers all instruments necessary for the constitution, transmission, and extinction of voluntary encumbrances. See **REGISTRATION OF DEEDS AND WRITS**. This system, while confirming the credit of the proprietor, also operates in favor of the security of creditors. There is a special *Register of Entails*, in which, in terms of act 1685, c. 22, deeds of entail must be recorded at the sight of the Court of Session. The object of registration in all these cases is *publication*; but charters by subjects, dispositions, bonds, contracts, and other probate writs may, under act 1698, c. 4, be recorded in the *Register of Deeds for preservation*. A third object of registration is *execution*. Every deed constituting a personal claim of debt, or an obligation to perform some lawful prestation, if intended to be made the subject of personal diligence for payment or performance, must be registered previously to execution being issued on it. Some volumes of calendars of state papers relating to Scotland have been issued to the public.

Ireland.—Many of the records perished during the wars prior to the final reduction of Ireland, and those which survived these commotions were long exposed to mutilation and destruction from the unsatisfactory arrangements for their custody. A commission was appointed in 1810 for the preservation and arrangement of the Irish records, whose labors, conducted with considerable success, were terminated by the revocation of the commission in 1830. In 1847, commissioners were again appointed to investigate the state of the records, in consequence of whose labors a bill for their safe custody was prepared, but afterwards abandoned. There is no general place of custody for the records of Ireland, which are scattered in different repositories in Dublin. Several volumes of calendars from the Irish *patent* and *close* rolls have been published under the direction of the Master of the Rolls.

RECORDE. ROBERT, generally allowed to have been the greatest English mathematician of the 16th c., but now almost forgotten, was born about 1500 at Tenby, in Pembrokeshire, Wales. He completed his education at Oxford, and there distinguished himself in mathematics, rhetoric, music, and anatomy; but wishing to make medicine his profession, he removed to Cambridge, and there, in 1545, he received the degree of M.D., 'being much admired by all who knew him for his profound and varied knowledge of art and science.' In 1547, he was in London, engaged in the composition of *The Urinal of Physic* (1548), a work which saw five editions; and was about the same time appointed family physician to Edward VI., and afterwards to Queen Mary. Ten years after this, we find him in the debtor's prison in London, where he died miserably in 1558.

His works are all in the form of dialogues between a master and his pupil, and are written in the rude English of his time; they are—*The Gate of Knowledge*, and *The Treasure of Knowledge*, two works that seem to be completely lost; *The Ground of Arts*,

teaching the Perfect Work and Practice of Arithm. tic, &c. (Lond. 1549), an arithmetical work which has been frequently reprinted, and which exhibits a curious 'mélange' of the Arabic and Roman notations; *The Pathway to Knowledge* (Lond. 1551), an abridgement of Euclid's *Elements*; *The Castle of Knowledge, containing the Explication of the Sphere both Celestial and Material, &c.* (Lond. 1551), an astronomical work, dedicated to Queen Mary, in which he compares the Ptolemaic and Copernician systems, and, but with great hesitation, gives the preference to the latter; *The Whetstone of Wit, which is the second part of Arithmetick*, a treatise upon algebra, a subject at that time little known, in which R. collects the substance of the best continental writers, and adds his own improvements and discoveries. In the appreciation of the general results derivable from algebraic formulae, he is far beyond his contemporaries, with the sole exception of Vieta (q. v.). R. is regarded as the inventor of the symbol (=) for equality, and of the mode of extracting the square root of compound quantities. R.'s talents seem to have been as varied as profound, for, besides his mathematical pre-eminence, he was considered to be a skillful doctor, an able lawyer, and a philologist of no mean ability.

RECORDER is a judge of a city or borough Court of Quarter Sessions, being a barrister of not less than five years' standing. He is appointed by the Home Secretary, and the salary is paid by the city or borough out of the borough fund. His duties are the same as what are usually discharged by Courts of Quarter Sessions, and are confined chiefly to the trial of prisoners who have been committed by justices of the peace for trial during each quarter of a year. The recorder is not prohibited from practising at the bar, and he is almost invariably a counsel in active practice. The salary is generally small, but, nevertheless, the office is in great request among members of the English bar. There is no such office in Scotland, but the sheriff discharges similar duties.

RECORDER, the name of a musical instrument formerly in use in this country, somewhat like a flageolet, but with the lower part wider than the upper, and a mouthpiece resembling the beak of a bird. Its pitch was an octave higher than the flute, and it had a pleasing tone, hence Milton speaks of

The Dorian mood
Of flutes and soft recorders.

RECOVERY, in English law, was a term much used in reference to estates tail, though it is also a general term denoting the decision of a court in favor of a party claiming lands or goods. A feigned recovery was an imitation of a similar proceeding, and was a device invented to break an English entail. An estate tail was an estate given to A and the heirs of his body, and at first it was enacted by a statute *De Donis*, under Edward I., that A could not sell or alienate the estate, so as to prevent the heirs of his body acquiring the benefit of it. But the lawyers invented a sham action and judgment, called a recovery, by which the issue were barred from all rights. The Fines and Recoveries Act abolished that form, and substituted for it a disentailing deed, which, when executed by the tenant in tail, has the same effect.

RECRUITING. Formerly, the task of raising recruits for the army was intrusted to the colonels of regiments, who employed civilian agents and others to persuade young men to join their standards; these agents often resorting to very illegal methods to entrap recruits. Subsequently, the duty was assigned to several recruiting corps, each known by the name of its commanding officer; but under this system, so many irregularities, and such difference of practice arose, that in 1802, for the purposes of uniformity, economy, and proper control, it was decided to place the whole recruiting under the immediate direction of the adjutant-general. For this purpose, the country was divided into recruiting districts. At the head of each district was placed an inspecting field-officer, with the duty of superintending all recruiting parties in his district, and of approving the recruits brought. At the district headquarters there was a paymaster responsible for all the financial concerns, and a medical officer, who examined the recruits in point of health and physical fitness.

Recruiting parties used to consist of old sergeants, who sought by every means to induce young men to enter the army; they frequented fairs, wakes, and country gatherings, endeavoring by beat of drum, smart uniforms, well-fed personal appearance, and persuasion—not always too truthful—to convince the rustics of the advantages of the Queen's service; advantages which really existed, though not always to the extent depicted. The adoption in 1872–1873 of the system of regimental localization changed all this. The United Kingdom is divided into 66 sub-districts, at the head of each of which is a colonel, who commands the brigade depot, and the auxiliary and reserve forces of his sub-district. He also controls the recruiting within his command, primarily, for the regiments composing the brigade; and secondly, for the rest of the army. To preserve uniformity of action, the colonels report on recruiting matters to the inspector-general of recruiting, an official on the staff at the War Office. The Army Discipline

and Regulation Act of 1879 prescribes the rules for recruiting. Every person authorized to enlist recruits for the regular forces must give to every recruit a notice showing the conditions of the contract, and directing him to appear before a justice of the peace. If the recruit does not appear before the justice, or, appearing, does not assent, no further proceedings are taken. If he assents to be enlisted, the justice reads a series of questions and receives his answers, the attestation of which the recruit signs. The justice then administers the oath of allegiance; whereupon the recruit is held to be enlisted as a soldier. If within three months of the attestation the recruit pays for the use of Her Majesty a sum of ten pounds, he shall, in ordinary circumstances, be discharged. Save in the British and American armies, voluntary enlistment is unknown, and compulsory military service more or less universally obligatory. See the articles on the various countries. About 18,000 recruits used to be raised annually in time of peace for the British army; but about 80,000 are required since enlistment for short service with the colors became the rule.

Recruiting for the navy is treated under **MANNING THE NAVY**.

RECTIFYING is a process applied to alcohol after its distillation, to remove certain impurities which come over with it from the still. These, in part, consist of essential oils; and in order to effect their removal, caustic potash is added in sufficient proportion to saponify the oil present; water is also contained in the first distillation, and to remove this, and to assist in removing the oily matters, common pearl-ash is added. Technically, the former of these is called *gray salts*, and the latter *white salts*; and about four pounds of each are added to every 700 gallons of spirit, and well agitated, so as to combine with the oil and water. The spirit is then distilled again, and comes over much more pure, the alkaline salts, and the matters which have been combined with them, being left behind in the still. This is usually repeated two or three times, the quantity of the salts being diminished to one-half in the second, and proportionately decreased in the succeeding distillations. The rectifier is not only a purifier of the alcohol produced by the distiller, but he often gives it a distinctive character; by adding flavoring materials to it, he makes it into gin, brandy, &c. Thus, in order to convert the spirit into London gin, juniper berries and coriander seeds are added previous to the last rectification. Eucalyptic ether and other things give the flavor of brandy. This part of the operation is very much varied by the taste and skill of the rectifier.

RECTOR (Lat. *rector*, a ruler), the title of several classes of clerical and collegiate officials, some of which are referred to under their respective heads. As regards clerical rectors, the title, in its most ordinary English use, is applied to the clergyman who holds complete and independent charge of a parish. This use, however, is a departure from the canonical signification of the title, which meant rather a clergyman who was appointed to govern a parish where the chief parochial jurisdiction was vested in a religious corporation or in some non-resident dignitary. In certain of the monastic orders, the name rector is given to the heads of convents, as it is also given to the heads of universities, colleges, seminaries, and similar educational corporate institutions.

RECTUM, DISEASES OF. The terminal portion of the intestinal canal, named, from its comparatively straight course, the rectum, is the seat of various affections requiring medical or surgical assistance. Some of these affections, as piles, prolapsus ani and hæmorrhage from the rectum, have already been considered. Amongst the other diseases of the rectum of sufficient importance to claim notice in these pages are—

1. *Stricture of the Rectum*, which may be either spasmodic or permanent. *Spasmodic stricture* is comparatively rare. *Permanent stricture* may be either of a simple or malignant nature. *Simple stricture* consists in a thickening and induration of the mucous coat of the rectum, so as to form a ring encroaching on the calibre of the tube. It is situated about two or three inches from the anus, and the contraction is so great and unyielding that it is often difficult to pass a finger through it. The symptoms are constipation and great pain, and a straining in evacuating the feces, which are passed in a narrow, flattened, or worm-like form, which is very significant of the nature of the case. In an advanced stage of the disease, diarrhoea and prolapsus often supervene. However great may be the constipation, strong irritant purgatives must be altogether avoided. Soft and unirritating evacuations must be procured by such medicines as the concoction of senna combined with sulphur (see **PILES**), or injections of castor-oil or of tepid water. The diet should be regulated so as to assist the action of the medicines. Nutritious soups are serviceable, since, at the same time, they support the strength and leave little matter to be excreted. When much local irritation is present, it may be relieved by the hip-bath and by sedative injections; till it is subdued, surgical interference would do more harm than good. A bougie capable of being passed with moderate pressure through the stricture, should be inserted in the gut

every third or fourth day, and should be allowed to remain for about a quarter of an hour; and its size should be gradually increased. Nothing is gained by the forcible passage of large bougies. The cure is to be effected by pressure so applied as to produce absorption, not by mere mechanical dilatation. *Malignant stricture*—most commonly due to the scirrhus, but sometimes to the epithelial form of cancer—is by no means a very rare affection, and is more common in the female than the male sex. Until ulceration sets in the symptoms are like those of simple stricture, only exaggerated in degree; but afterwards there is a discharge of fetid muco-purulent matter streaked with blood. In this disease, the treatment can be only palliative, unless the surgeon resort to the formation of an artificial anus in the loins as a last resource.

2. *Spasm of the sphincter ani* muscle is characterized by extreme pain in the region of the anus, especially when an attempt is made to evacuate the bowels. The muscle contracts so firmly that the surgeon cannot easily introduce the finger into the rectum. The spasm may be caused by piles, by fissure of the anus, by ulceration of the rectum, and sometimes apparently by mere constipation. It is often relieved by the application of the Belladonna Ointment of the British Pharmacopœia.

3. *Neuralgia of the rectum*, known also as *proctalgia*, is a common disorder, and is especially prone to attack children and gouty persons. It is usually relieved by the judicious use of aperient medicines.

4. *Congestion*, sometimes proceeding to *inflammation*, is not uncommon in the rectum. The congestion occasions a sense of weight and fulness in and about the rectum, together with a variety of other symptoms. Amongst the causes of this affection are stone in the bladder, stricture of the urethra, an enlarged prostate gland, the presence of thread-worms, the abuse of irritating purgatives, exposure to cold draughts in the water-closet, &c.; and there can be no doubt that sedentary habits strongly favor the predisposition to this affection. The great object of treatment is to relieve the over-loaded vessels of the rectum. The bowels should be freely opened with castor-oil, leeches should be applied to the verge of the anus, and after their removal a warm hip-bath is advisable.

5. *Pruritus podicis*, or *itching of the anus*, is a very common and extremely troublesome affection. Sometimes it depends on the presence of thread-worms or of old piles, while in other cases it is one of the manifestations of the skin disease known as *Prurigo* (q. v.). The treatment must depend upon the exciting cause.

6. *Fissure of the anus* is a small crack which gives intense pain during the passage of the fæces, and often persisting for several hours. Free purgatives, and the application of astringent lotions or ointments (as tannin lotion or ointment of galls) should be tried; and if they fail, partial division of the sphincter muscle must be resorted to—an operation easily performed, and certain to give relief.

7. *Fistula in ano* signifies a fistulous or pipe-like track by the side of the *sphincter ani* muscle. It may occur as a *complete fistula*, which has an external opening near the anus, and an internal opening into the bowel; or as a *blind external fistula*, which has no actual opening into the bowel, although it extends to its outer coat; or as a *blind internal fistula*, in which the preceding conditions are reversed. A sketch of the mode of treatment is given in the article FISTULA.

For a detailed description of these diseases of the rectum, and for information on many other less important affections of this part of the body, the reader is referred to Bushe's *Treatise on the Rectum*, and to the more recent works of Mr. Ashton and Mr. Henry Smith on the same subject.

RECU'SANTS, in English law, are persons who refuse or neglect to attend at the worship of the established church on Sundays and other days appointed for the purpose. The offence as a legal one may be held to date from 1 Elizabeth c. 2; but there were four classes punishable under the statutes against recusancy simply 'recusants;' 'recusants convict,' who absented themselves after conviction; 'popish recusants;' who absented themselves because of their being Roman Catholics; and 'popish recusants convict,' who absented themselves after conviction. It was against the last two classes that the statutes were mainly directed. In addition to the general penalties of recusancy, the popish recusants, for wilfully hearing mass, forfeited 100 marks (£66, 13s. 4d.); and for saying mass, 200 marks, or £133, 6s. 8d., in addition (in both cases) to a year's imprisonment. They were disabled, unless they renounced popery, from inheriting, purchasing, or otherwise acquiring lands; and they could not keep or teach schools under pain of perpetual imprisonment. Popish recusants convict could not hold any public office; could not keep arms in their houses; could not appear within ten miles of London under penalty of £100; could not travel above five miles from home without license; could not bring any action at law on equity; could not have baptism, marriage, or burial performed, except by an Anglican min-

ister; all under penalties of forfeiture and imprisonment. Protestant dissenting recusants were relieved from the penalties of recusation by the Toleration Act of 1 Will. and Mary, c. 18. Catholics were partially relieved in the year 1791, and completely by the Emancipation Act of 1829.

REDA'N is the simplest work in field-fortification. It consists of two parapets whose faces join in forming a salient angle towards the enemy, like a letter V, in which the apex is to the front. Regarded by itself, the redan is a work of very little strength, since there is no flanking fire to protect its faces, and nothing to prevent an enemy from forcing an entrance at the gorge; but redans are useful in many positions, and the rapidity with which they may be constructed, render them favorites with engineers and generals. A row of redans along an exposed front of an army adds much to its strength, the troops behind protecting the gorge, and the redans flanking each other. It forms an excellent defence for a bridge-head, the gorge being covered by the river. Redans figured largely in Wellington's works for defending Lisbon in 1810. The redan of Sebastopol in 1855 was the principal point of the English attack, and the scene of two bloody repulses by the Russians in June and September.

REDBREAST (*Erythra rubecula*, or *Sylvia rubecula*), a bird of the family *Sylviadae*, familiar to every one in the British Islands and throughout most parts of Europe—a universal favorite, from the readiness with which it approaches or enters human habitations, its lively manners, its aspect of pert curiosity, the frequency with which its song is heard in autumn and winter, and the strange mixture of shyness and audacity which its behavior displays. It is generally known throughout Britain by the endearing name of *Robin Redbreast*, or more briefly *Robin*, and has many similar appellations in continental Europe, significant of the kindly regard entertained for it, which is everywhere such that children early begin to distinguish it from all other birds as their peculiar favorite. Its utmost length is about 5½ inches, but it is of a rounder and fuller form than many of the *Sylviadae*, the slenderness of its legs rather strikingly contrasting with the form of the body. The wings are rather short, the fifth quill the longest. The tail is scarcely forked. The bill is rather broad and depressed at the base, narrower and slightly compressed at the point, the upper mandible bent down and notched. The general color is olive-brown, and the reddish-orange breast is a conspicuous characteristic, particularly of the male.

The R. is a native not only of Europe, but of the western temperate parts of Asia, and of the north of Africa. In the most northern parts of Europe it does not appear; and in many northern regions it may be regarded as a bird of passage; but, contrary to the ordinary rule as to birds of passage, it never congregates in flocks; it is always seen either solitary or in pairs. The attachment of pairs seems to extend beyond the mere breeding season, and, indeed, throughout their lives, and to be stronger than in most birds. The breeding season is early in spring. The nest is made of moss, dead leaves, and dried grass, lined with hair, often placed a little above the ground in a bush or among ivy on a wall; the eggs five to seven in number, white, spotted with pale reddish-brown; but many are the stories of the curious situations in which the R. has built its nest, in close proximity to houses and workshops, regardless of the presence of human beings, and of the noise of hammers and wheels. In winter, the R. seeks the neighborhood of human habitations more than in summer, and becomes more bold and familiar. Its food ordinarily consists of worms, insects, and berries; and when it becomes a pensioner at any door or window, which it very readily does, it shows a particular relish for small scraps of meat. Its song is sweet and plaintive, but weak, not much noticed amidst the many voices of summer, but often heard in the quietness of autumn, and even of winter, throughout which it is continued whenever the weather is good.

In America, the name of R. is often given to the Blue Bird (q. v.).

RED COLORS. Those used by painters consist of certain chemical compounds, natural or artificial. Thus, the red pigment called Armenian Bole, is either the ochreous earth known by that name, imported from Armenia, Tuscany, and other places, or else, as is most frequently the case, it is a composition of whitening, red oxide of iron, and red ochre. Vermilion is a sulphuret of mercury produced either naturally or artificially. Chrome-red is made by boiling carbonate of lead with chromate of potash in excess, until it assumes a red color, after which it is washed in pure water, and dried in the shade. Indian-red is a native product of Persia, being found in the neighborhood of Ormuz. It is imitated by calcining colcothar with red ochre. Light-red is made by calcining yellow ochre, and this can be converted into flesh-color by a due admixture of white. A bright orange-red, sometimes called Sandix, is made by calcining white-lead. Minium, or Red Lead, is a very distinct red color, requiring but little preparation; it is much used. Red ochre is extensively found in the

Mendip Hills, and is an oxide of iron; with clay, it forms a brownish-red paint. There are several other red colors, but these are the principal ones employed by painters.

RED CRAG, a deposit of quartzose sand intermixed with rolled and comminuted shells, of a deep ferruginous or ochreous color, which occurs in Suffolk, and belongs to the Pleiocene strata (q. v.).

RED DEER. See **STAG**.

RE'DDITCH, a busy manufacturing town of Worcestershire, stands on an acclivity 12½ miles south-south-west of Birmingham, with which it is connected by railway. Needles, pins, fish-hooks, and fishing-tackle are made extensively. Pop. (1871) 6135; (1881) 9964.

REDDLE, **RADDLE**, or **RED-CHALK**, an ochrey red-clay iron ore, which is chiefly imported from the continent, where it is found in Hessa, Thuringia, Upper Lusatia, Silesia, and Salzburg. It is found in small quantities in England, in the neighborhood of Rotherham, and at Wastwater, Cumberland. The English differs somewhat in quality from the foreign, and is chiefly used in polishing spectacle glasses. Of that from abroad, the finest quality is used for drawing on paper; the inferior sorts are used by carpenters and others for marking with; and the commonest is used for marking sheep. It occurs generally in thin beds, in clay-slate.

REDE'MPTION, in Law, the right of redeeming property which has been pledged to secure a debt. The equity of redemption is the name given to this right, and is commonly used in reference to mortgages of real estate, the mortgagor, after executing a deed of mortgage, having a right at any time to pay off the debt, and redeem or get back his property, unless he has been foreclosed by the creditor by a legal proceeding, the object of which is to sell the property to pay the debt. In Scotland, the equity of redemption is more usually called a reversion.

REDE'MPTIONISTS, one of the names of an order of monks devoted to the redemption of Christian captives from slavery. They are more frequently called **TRINITARIANS** (q. v.).

REDE'MPTORISTS, called also **LIGUORIANS**, a congregation of priests founded by St. Alfonso Liguori (q. v.).

RED-EYE, or **RUDD** (*Leuciscus erythrophthalmus*, see **LEUCISCUS**), a fish of the family *Cyprinidae*, common in lakes, slow rivers, fens, &c., in many parts of Europe and in England. It much resembles its congener the Roach (q. v.), but is shorter and

Red-eye, or Rudd (*Leuciscus erythrophthalmus*).

deeper. It is a richly-colored fish. The name Rudd refers to the color of the fish, the name Red-eye to that of its iris. The R. is better eating than the roach. It is readily caught by a baited hook. It sometimes attains a weight of two lbs.

RED GUM is the popular name for the papulous disease of the skin known to the physician as *strophulus*. It is a florid eruption, usually occurring in infants before or during their first dentition, and appearing on the most exposed parts, as the face, neck, arms, and hands, from whence it sometimes extends to other portions of the body. It occurs in minute red pimples, irregularly arranged, with occasional red patches, and sometimes a few interspersed vesicles. White pimples, popularly known as *white gum*, are also sometimes intermingled with the red papillæ. *Strophulus* is almost always an acute disease, seldom lasting more than a month. It is almost always an innocent complaint, and often occurs without any marked disturbance of the general health. In severe cases, the pimples cause a sensation of heat and itchiness, especially if the child is kept too warm, and slight febrile symptoms manifest themselves. Amongst the probable causes of this disease are the irritation caused by rough flannel next the skin, want of cleanliness of the skin—especially in relation to the child's excretions—the general disturbance of the system excited by teething, &c. Very little is required in the way of treatment further than to remove any obvious cause of the affection. Cold applications should be carefully avoided, lest they should translate the cutaneous irritation to some important internal organ. In the event of such a translation, the child should be placed in a hot bath, and mustard poultices or hot

moist cloths sprinkled with turpentine, should be applied over the arms and chest.

RED HAND, in Heraldry. A sinister hand erect, open, and couped or, the wrist gules, being the arms of the province of Ulster, was granted to the baronets of England and of Ireland as their distinguishing badge, on the institution of that order in 1611, and is borne by the baronets of Great Britain and of the United Kingdom. It is assumed into the armorial coat, and may be borne upon a canton, or on an escutcheon, which may be placed either in the middle chief or in the fess point, so as least to interfere with the charges composing the family arms.

RED-HOT SHOT are cannon-balls heated to redness, and fired from cannon at shipping, magazines, wooden buildings, &c., to combine destruction by fire with battering by concussion. In the great bombardment of Gibraltar on Sept. 13 and 14, 1782, red-hot shot was used with great effect by the defenders under the governor, General Elliott, the attacking squadron being completely silenced, and a large number of ships set on fire.

REDING, **ALOYS VON**, the famous champion of Swiss independence, was born in 1755, in the canton of Schwyz. After serving in Spain, he returned to Switzerland in 1788. As captain-general of the canton of Schwyz, he repulsed the French Republicans, May 2, 1798, at Morgarten. After the formation of the Helvetic Republic, R. was one of those who eagerly worked for the restitution of the old federal constitution. In 1802, he founded in the eastern parts of Switzerland a league, with the intention of overthrowing the central government. When, after the departure of the French, almost all the cantons declared themselves against the Helvetic government, R. called a general diet at Schwyz, which assembled September 27, 1802, and occupied itself with the formation of a new independent constitution. R. went to Paris, in order to win over the First Consul to the proposed change. In spite of all his endeavors, however, he failed to succeed. The disarmament of the Swiss by a French army, and the acceptance of the act of mediation, put an end to his hopes and to his political activity. In 1803, he officiated still as Landamman, or chief magistrate, of Schwyz; but after that retired into private life till 1809, when he was invested once more with the same dignity. In 1813, R. conducted the negotiations with the allies in regard to the neutrality of Switzerland. He died in February 1818, leaving the character of an honest man, whose political career might have been more successful, had he not been wanting in firmness of mind and of character.

RED-LIQUOR, a chemical compound, much used by dyers. It is a crude acetate of alumina, and is commonly prepared in dyeing establishments by dissolving a quantity of alum in boiling water, and separately dissolving, also in hot water, three-fourths as much acetate of lead. The two solutions are next mingled together, and after settling, the clear fluid, which is the red-liquor, is poured off. The sediment is sulphate of lead.

REDOU'BT is a small fort of varying shape, constructed for a temporary purpose, and usually without flanking defences. The term is vague in its acceptance, being applied equally to detached posts and to a strong position within another fortress. Redoubts as a general rule do not exceed 40 yards square, with 4 guns and a garrison of 320 men. Redoubts are made square, pentagonal, and even circular. Each redoubt has parapet, ditch, saps, ban-

Fig. 1.

quette, &c., as in regular fortification; but it is commonly rather roughly constructed, haste and unprofessional labor precluding mathematical accuracy. The entrance may be by a cutting through the parapet, as at *a*, in fig. 1, the cutting being covered within by a traverse; or, preferably, by an excavated gallery leading into

the ditch, and thence by a ramp through the counterscarp. For the sake of flanking the ditch, and preventing an assaulting party from forming in it, caponnières of timber, loopholed, are sometime formed, as at *b*; or, if the soil be stiff or chalky, a gallery may be ent behind the counterscarp, and loopholed towards the ditch. In some modern redoubts, the line of each side is broken to afford flanking defence, as in fig. 2. Redoubts have the weak feature of

Fig. 2.

not defending their own ditches, and of being approached at their salient angles with comparative impunity. They are therefore not adapted to a protracted defence, but as temporary field works, or in a war of posts, they are often of incalculable importance. Troops whose stability in the open field is doubtful, are especially strengthened by redoubts in their line. Redoubts are particularly useful in fortifying the tops of hills, or commanding passes, or where the object is to occupy a hostile territory, or to feel the way gradually through a wooded country.

REDOUT KALÉ, a port on the Black Sea coast, in the district Kutais of the Russian lieutenantancy of Caucasus, is situated in a marshy region at the mouth of a small river, about 12 miles north of Poti. It possesses a Russian fortress of considerable strength, fired by the Russians in 1854, to prevent its falling into the hands of the English. Population inconsiderable, though increasing.

RED POLE. See LINNET.

RED RIVER, the lowest western branch of the Mississippi, rises on the eastern border of New Mexico, flows eastward, separating Texas from the Indian territory, thence south-east through Louisiana, and enters the Mississippi 341 miles from its mouth. It is 2100 miles long, and receives numerous branches, the Washita, Negro, Big and Little Wichita, &c. Near its source, the south branch runs for 60 miles between perpendicular banks, 600 to 800 feet high. It is navigable for 8 months of the year to Shreveport. Thirty miles above this place is the Great Red River raft, formed of drift-wood, which blocks up the river for 60 or 70 miles. Its other important towns are Alexandria and Natchitoches.

RED RIVER OF THE NORTH rises in a cluster of lakes in Western Minnesota, U.S., near the sources of the Mississippi, and runs north, separating Minnesota from Dakota, into the British possessions, and empties in Lake Winnipeg, about 500 miles from its source, watering a beautiful country, and receiving numerous branches, the chief of which are the Cheyenne, the Pembina, and the Assiniboine.

RED RIVER, or SELKIRK SETTLEMENT, was a colony in British North America (of which the chief part is now known as MANITOBA), lying along the Red River of the North. In 1811 the Earl of Selkirk, a member of the Hudson's Bay Company, attracted by the fertility of the soil on the banks of the Red River, obtained from the company a grant of a large tract of land on both banks of the river, extending some distance within the present frontier of the United States. Next year he brought out a number of settlers from the Highlands of Scotland. The right of the Hudson's Bay Company to grant this land was, however, disputed by the North-west Company; and when the settlers commenced to build, they were driven off by the servants of the North-west Company. Hostilities continued between the servants of the two companies for several years, and in 1816 there was a pitched battle between them. The Earl of Selkirk arriving soon after found his settlers scattered; but by his energetic measures, and by help of 100 disbanded soldiers from Europe whom he had brought with him, he secured for his old and new protégés a peaceful settlement. They established themselves near Fort Garry; and in 1817 the earl obtained from the Indians a transfer of their right to the land two miles back from the Red River on both sides. Still the settlers had some difficulties to overcome, especially from visitations of grasshoppers. These were gradually surmounted; but the population, including now a large number of half-breeds, remained very isolated, having little communication with the outside world.

In the year 1869 the Hudson's Bay Company surrendered all their claims to the North-west Territory to the British government, which in the following year transferred that territory to Canada. The Canadian government now organized that portion of the Red River district between long. 96°—99° W. and lat. 49°

—50° 30' N. as the PROVINCE OF MANITOBA. In 1881, the area of Manitoba was enormously increased, being enlarged from 14,000 square miles to about 150,000; and the province now extends from 89° 20' to 101° 50' W. and from 49° to 52° 30' N. The population by the census of that year was, within the new limits, 65,954; the estimated pop. in 1888 was 160,000. The capital is Winnipeg (q. v.); pop. 7985 in 1881 (15,000 in 1889).

The Red River Valley is a level plain or prairie, with a soil unsurpassed in fertility by any in the world. It consists of from two to four feet of rich black mould, resting on a marly clay which elsewhere would itself be reckoned good soil. In places the ground has been cropped for fifty years without any apparent diminution of its fertility. The surface was generally treeless and ready for the plough, though a few miles to the eastward the country was wooded. The rich natural grasses of Manitoba afford a very favorable pasture for cattle. At the time of the transfer, the population was about 12,000. Since then there has been a steady influx of immigrants from the eastern provinces, from Britain, from the United States, from Iceland, and elsewhere. In 1882, the following towns maintained newspapers: Winnipeg, St. Boniface, Brandon, Portage-la-Prairie, West Lynn, Rapid City, Emerson, Maurice, Morrison, Rat Portage, Gladstone, Selkirk, Rock Lake, Crystal City, Minnedosa. Trade has rapidly increased. In the three years 1879 to 1881, the total exports of Manitoba rose from \$512,000 to \$626,000; the imports, from \$1,000,000 to nearly \$2,000,000. Manitoba is intersected by the Canadian Pacific Railway, and has direct railway connection southward with the United States. For the proposed direct sea route by Hudson's Bay, see that article. The government consists of a lieutenant-governor, appointed by the Dominion Government, a small executive council, and a legislative assembly. The university of Manitoba, at Winnipeg, embraces the college of St. Boniface (Roman Catholic), St. John (Episcopal), and Manitoba (Presbyterian). Provision has already been made for common schools throughout the province.

While the transfer to the British crown was pending, this district was the scene of contention. In 1869, the French-speaking population, led by Louis Riel, organized a force, imprisoned their English and Scotch opponents, seized Fort Garry, established a provisional government, robbed the strong box, and dictated terms to the governor of the Hudson's Bay Company, to which he had to submit. A military force arrived in 1870, and Riel, fearing capture, escaped, an event which put an end to the insurrection.—See Prof. Bryce's *Manitoba* (1882); two works by Fraser Rae; *A Year in Manitoba* (W. & R. Chambers, 1882).

RED ROOT (*Ceanothus*), a genus of plants of the natural order *Rhamnaceæ*, consisting of deciduous shrubs with simple alternate leaves and large red roots, whence their common name. The common RED ROOT of North America (*C. Americanus*), which abounds from Canada to Florida, is a shrub of 2—4 feet high, with beautiful thyrses of numerous small white flowers. It is sometimes called *New Jersey Tea*, an infusion of its leaves being sometimes used as tea. It serves also as an astringent, and for dyeing wool of a cinnamon color. A Mexican species has blue flowers, and a Californian kind is used for evergreen hedges.

RE'DRUTH, a town of Cornwall, consists chiefly of one long street, which stands on a hill, in the center of a famous mining district, 9½ miles north-west of Falmouth. Iron foundries are in operation; but the principal product of this vast mining district is copper. In the vicinity are many mines, which are worked by large steam-engines. By railway there is easy communication to St. Ives and Falmouth Bays. Pop. (1871) 10,685; (1881) 9385.

RED SANDSTONE was the term formally applied to the combined Devonian and Permian rocks, when their relations to the Carboniferous strata were unknown. The discovery that one set of the red sandstone was below the coal, while the other was above it, caused their division into the Old Red (q. v.), or Devonian, and the New Red, or Permian (q. v.). For some time after this division, the original term Red Sandstone was retained by a few geologists to characterize the newer set of red rocks, but it is now quite given up.

RED SEA, or ARABIAN GULF, an inlet of the Indian Ocean, in form a long and narrow gulf, stretching north-west from the Strait of Bab-el-Mandeb (lat. 12° 40' N.), by which it communicates with the Gulf of Aden, to the Isthmus of Suez (lat. 30° N.), which parts it from the Mediterranean Sea. It separates Arabia on the east from Egypt, Nubia, and Abyssinia on the west. Its extreme length is over 1400 English miles; it varies greatly in breadth—from about 20 miles at the Strait of Bab-el-Mandeb, to upwards of 230 at about lat. 16° 30'. At Ras (Cape) Mohammed (lat. 27° 40' N.), the sea is parted into two arms or smaller gulfs, which enclose between them the peninsula of Mount Sinai; that on the west, continuing the direction of the main body of the sea, is the Gulf of Suez (Baher-es-Suweis), of which the Strait of Jubal or Jubah forms the entrance; its length is about 180 miles; extreme breadth (about lat. 29°), upwards of 30. The eastern arm,

called the Gulf of Akabah (Bah-el-'Akabah), is entered by the Strait of Tiran, and runs north-north-east to lat. $29^{\circ} 30'$ N. Its length is upwards of 100 miles; greatest breadth, rather more than 15. The depth of the R. S. varies considerably, but is in many places very great; the deepest sounding is marked as 1054 fathoms, in lat. $22^{\circ} 30'$. Southward of 16° , it is comparatively shallow; but the shallowest part of the whole Sea is the Gulf of Suez, which decreases in depth from 40 or 50 fathoms at the entrance to 8 fathoms in Suez Harbor, at the northern end, where the Gulf, which is supposed in ancient times to have extended considerably further north, has apparently been filled up by the sand washed up by the strong tides, or drifted in by the winds. The Gulf of Akabah is much deeper; it is, in fact, a narrow, deep ravine, with steep and rocky sides, forming the termination of the long valley of the Arabah, running northward to the Dead Sea. The basin of the R. S. itself is the lowest portion of a deep valley lying between the highlands of Africa on the west, and the lofty plateau of the Arabian hills on the east, which latter, rising at some little distance inland, leave for the most part a sandy and sterile tract along the sea.

The navigation of the R. S. has always been accounted difficult and dangerous, owing to the prevalence of violent winds, and the number of islands, shoals, and coral reefs, which line the shores. These coral reefs extend generally in parallel lines along the coast; they abound in all parts, but are especially frequent on the Arabian side, where the navigation is consequently very intricate. The coral is very beautiful, often red or reddish in color, but more commonly white. The islands generally occur singly, but between the parallels of lat. 15° and 17° , they are found massed in two groups—the Parsan (q. v.) Islands on the eastern, and the Dhalac (q. v.) Islands on the western side. In mid-channel, south of Ras Mohammed, there is generally a width of 100 miles clear. Along this channel, the winds are constant throughout the year in one of two directions; from May to October, the north-west monsoon blows; for the rest of the year, the south-east is the prevailing wind, and the water in the northern part of the Sea is then raised to a higher level than the Mediterranean. It had been generally supposed that the level of the R. S. was more than 30 feet higher than that of the Mediterranean, but it is now known, from careful observations, that the levels of the two seas are really the same. The principal ports are, on the Arabic side, Mocha, Jeddah (the port of Mecca), and Yembo (the port of Medina); on the west, Suez, Cosseir, Suakin, and Massowah. The origin of the name R. S. has given rise to a variety of conjectures, and has never yet been satisfactorily settled. It is supposed to have been so called from the name Edom (Red), as the mountains of that country are washed by the waters of the Gulf of Akabah; from the red and purple coloring of the rocks which in some parts border it; from the red color sometimes given to the waters by animalcules and sea-weed; or from the reddish tinge imparted to them in some places by the subjacent red sandstone and reddish coral reefs. To the Hebrews it was known as *Yam Saph*, the sea of *weeds* or *sedg*. By the Greeks, in the earliest times, the name R. S. was given to the whole of the Indian Ocean, including both the R. S. and the Persian Gulf, and not distinctively to the former (which was then and afterwards known as the Arabian Gulf), though the name, in later times, gradually became restricted in its application.

From the earliest times, the R. S. has been a great highway of commerce between India and the Mediterranean lands, and traversed successively by Egyptians, Phœnicians, Hebrews, and Arabs. It is first mentioned in the Book of Exodus, on occasion of the passage of the Israelites, which is supposed to have taken place a little south of the present town of Suez. The first recorded navigation of the Sea was in the time of Sesostris, in the 14th c. B.C. Three centuries later, Hebrew and Phœnician ships traversed the R. S. on the voyage to Ophir, from the port of Eziongeber, at the head of the Gulf of Akabah. The Gulf of Suez was for many centuries apparently the seat of the Egyptian trade in this sea and to India. After the foundation of Alexandria, and during the dynasty of the Ptolemies and the Roman dominion, the trade with India was vigorously carried on, though the chief seat of traffic was moved further southward, to the towns of Berenice and Myos Hormos, which sent out annually large fleets to India. After the establishment of the Mohammedan empire in the 7th c., an important trade with India and China seems to have been carried on through the R. S.; and through it, in the period between the 12th and 15th centuries, the goods of the East passed to the Venetian factories in Alexandria, until the discovery of the route round the Cape of Good Hope diverted the traffic with India into a different channel, and put an end to the commerce of the Red Sea. Since the establishment of the so-called Overland Route to India, and the opening of the Suez Canal in 1870, the R. S. has gained its importance as the highway of commerce between Europe and the East. See SUEZ. Italy has acquired a station on the west coast of the Red Sea, at Assab, near Bab-el-mandeb. France has four; Obock (for the

Abyssinian trade), Dessi (island at Annessly Bay), Ad, and the peninsula of Sheik Said.

For the classical geography of the R. S. the *Geographi Græci Minores* of Müller (Paris, 1855), Kiepert's *Ancient Geography* (1881), and Bunbury's *History of Ancient Geography* (1880), may be consulted. Fuller information on the R. S. and its coasts will be found in the *Travels* of Niebuhr, Salt, Burckhardt, Ruppell, and others.

REDSHANK. See SANDPIPER.

REDSHID PASHA, a celebrated Turkish statesman, and long the chief of the party of progress in Turkey, was born at Constantinople about 1800. He accompanied his brother-in-law, the governor of the Morea, into Greece, and after his death, obtained the post of chief secretary in one of the government offices at Constantinople. On the outbreak of the Russian war (1828—1829), he was charged with a mission in Bulgaria, and exerted himself effectually to protect the Christian subjects of the Porte from the fanatic rage of their Moslem neighbors; and on his return obtained from Mahmud, who fully appreciated his character, a post in the foreign office. On the creation of resident representatives at foreign courts, R. was sent to the courts of France and Britain, and applied himself diligently to the study of the language, manners, and political constitution of these countries; but was recalled in 1837, and nominated grand-vizier. His persuasive eloquence and firmness of character greatly aided the sultan in carrying out his plans for the better centralization of the administration, and for mercantile intercourse with foreign nations; but the old Turkish party were still too strong for him, and he was compelled to resign office, and return to Paris and London to support the Turkish against the Egyptian interests. Recalled by the death of the sultan, and the disaster of Nisib, to his old post, the foreign office, he succeeded, after a debate in council of three days' duration, in obtaining the hattisherif of Gulhane (8d November 1839), a species of constitutional charter, which, from the comparative weakness of its promoters, became a dead letter. The effects of his foreign diplomacy were soon apparent in the humiliation of the Egyptians in Syria; but a seraglio intrigue, which occasioned his dismissal, deprived him of the honor of concluding peace.

From 1841 to 1845, he was the Turkish representative at the French court, and though recalled to fill the post of grand-vizier (28th September 1846), he found his influence at court greatly diminished under the new sultan. He was vigorously supported by Sir Stratford Canning, the English ambassador, who was of opinion that all hopes of a bright future to Turkey depended solely upon Redshid Pasha. He was frequently deposed, and almost immediately recalled, according as the anti-reform party gained or lost the ear of the sultan; but the complications with Russia, which arose in 1853, threw the anti-reformers (who had counselled an obstinate disregard of all the Russian representations) into discredit, and R., more powerful than ever, was again recalled to the direction of foreign affairs. In 1854, he was again overcome by his political opponents, and retired from office, which he did not resume till after the peace of Paris. His re-appointment as grand-vizier excited great hopes of further salutary reforms; but the French influence at the Porte was pertinaciously antagonistic, and he was twice forced to resign, and as often recalled. At last, worn out with harassing cares and toil, he was seized with an illness, to which he speedily succumbed, at his palace of Emmirgian, 7th January 1858. Though a Turk, he was one of the most enlightened men of his time, and was well versed in foreign languages, general literature, and science.

RED SNOW. The apparent redness of snow, as seen from a distance, is often an effect of light, which adds a peculiar charm to mountain and winter landscapes, particularly in the mornings and evenings, when the rays of the sun fall most obliquely on the surface of the snow. But snow is occasionally found both in polar and alpine regions of a really red color. This phenomenon seems to have been observed by the ancients, as a passage in Aristotle apparently refers to it; but it attracted no attention in modern times till 1760, when Saussure observed it in the Alps, and from chemical experiments concluded that the red color was owing to the presence of some vegetable substance, which he supposed might be the pollen of a plant.

The next observations on red snow were made in the arctic expedition under Captain Ross, when it was found extending over a range of cliffs on the shore of Baffins Bay for eight miles, and the red color penetrating the snow in some places to a depth of 12 feet. On the return of the expedition in 1819, the coloring matter, as then existing in the melted red snow, was subjected to careful examination by Robert Brown and by Francis Bauer, the former most eminent botanist pronouncing it to be an unicellular plant of the order *Algæ*, whilst the latter referred it to *Uredo*, a genus of *Fungi*, and called it *U. nivalis*. Baron Wrangel afterwards declared it to be a *Lichen*, and called it *Leparia Kermesina*; but Agardh and Dr. Greville of Edinburgh—the latter of whom obtained specimens from the Scottish island of Lismore—on further

examination, returned to the opinion of Brown, an opinion which has since been fully confirmed, and the plant is generally known by the name *Protococcus nivalis*, given to it by Agardh, or *Palmella nivalis*, given to it by Sir William Hooker. The motions of this microscopic plant in the earlier stages of its existence have led some observers, and among them eminent naturalists, to regard the organisms which they found in red snow as animalcules. See PALMELLACEÆ. But whilst no doubt is now entertained of its real nature, it is not impossible that animal as well as vegetable life may exist in red snow, and that real animalcules may have been observed. The red snow plant consists, in its mature state, of brilliant globules like fine garnets, seated on, but not immersed in, a gelatinous mass.

REDSTART, *Phoenicurus ruticilla*, or *Ruticilla phoenicurus*, a bird of the family *Sylviadæ*, nearly allied to the Redbreast, but having a more slender form and a more slender bill; the male in summer having the head, back, and wing-coverts gray; the forehead white, with a narrow black band at the base of the bill; the throat, sides of the neck, and face jet black; the wings brown, the tail and upper tail-coverts bright rufous chestnut, with a strip of dark brown on the centers of the two middle feathers; the rest of the under-parts mostly pale chestnut. The female is grayish-brown, with neither the white nor the black on the head, and less red on the tail. The R. is widely diffused over Europe, Asia, and the north of Africa. It appears in Britain as a summer bird of passage, and is found in almost all parts of the island. It is a bird of very lively manners, remarkable for the way in which it fits about, in and out of some hedge or bush, where it is in quest of insects. It has a very soft melodious song, which is continued during the breeding-season far into the night, and resumed at early dawn. In confinement it becomes very tame, and has been known to imitate the song of other birds, and even to learn a tune.—The BLUE-THROAT (q. v.) also belongs to the same genus.—The AMERICAN R. (*Setophaga ruticilla*) is a small bird of the family *Muscicapidæ*, or Fly-catchers, common in most parts of North America, a bird of great beauty, and extremely active in its movements.

REDUCTION, in Arithmetic, is the conversion of a quantity in one denomination to an equivalent one of a different denomination. In the reduction of a quantity from a higher to a lower denomination, the process of multiplication is employed; and, contrarily, division is the needful process when a number of a lower denomination has to be reduced to an equivalent number of a higher.

REDUCTION, in Scotch law, means the annulling or setting aside of a deed or instrument, and thereby annihilating its legal effect. The action of reduction commences with a summons requiring the defender to bring the deed into court to be set aside, stating the reasons of reduction. The defender, if he defend the action, returns the summons, which implies that he intends to satisfy the production; i. e., to produce the document, and maintain its validity. The action can be raised only by a person who has some title or interest connected with the matter.

REDUCTION OF METALS. A metal is said to be reduced to its metallic state when it is separated from the condition of a chemical compound in which it exists as an ore. This is generally effected either by the direct action of heat, or by heating the compound along with a *reducing agent*. Thus, when oxide of mercury is simply heated, the oxygen is given off as gas, and mercury or quicksilver appears as metal. Again, when sulphuret of lead is heated with iron, sulphuret of iron is formed, and the lead is reduced to its metallic state. In this case, the iron is the reducing agent. The principal reducing agent employed in metallurgy is carbon, or rather the gas carbonic oxide, which is formed under certain conditions when carbon is burned. See METALLURGY, IRON.

REDUIT, in Fortification, is a central or retired work within any other work, intended to afford the garrison a last retreat, whence they may capitulate. It is commonly of masonry, loop-holed, and often circular. Many engineers doubt the use of reduits altogether, as blocking up the working space, being themselves inconvenient for the men, and incapable of protracted defence, while they frequently mask the fire of other works more to the rear.

RED-WATER—also known as Bloody Urine, Moor-ill, and Hæmaturia—is a disease of cattle, and occasionally of sheep; it depends upon the eating of coarse indigestible innutritive food, on continued exposure to inclement weather, and on other such causes, which lead to a deteriorated state of the blood. In England and Ireland, it affects cattle of all ages and of both sexes; but in Scotland it is most common amongst milch cows within a fortnight after calving. The appetite and rumination are irregular, the bowels speedily become constipated, and the urine reddened with the broken-down red globules of the blood. In the more advanced stages of serious cases, the urine is black. A dose

of physic must at once be given, and for an adult animal may consist of $\frac{1}{4}$ lb. each of common and Epsom salt, 3 ounces of sulphur, and a pound of treacle, mixed together in two bottles of water. Roots should be withheld, and the food consist of sound hay with a little cake. A full supply of pure water is further essential. Weakness, which is apt to supervene, may be warded off by giving several times daily two ounces each of gentian and ginger in a quart of ale. To prevent red-water, attend to feeding and watering, place rock-salt in the pastures and yards; and, as has been successfully done in Cheshire and other English counties, improve the grazing-lands, notorious for the production of the disease, by draining, liming, and manuring; and where these means are ineffectual, by ploughing them up, and cropping them for a few years.

REDWING (*Turdus iliacus*), a species of Thrush (q. v.), well known in Britain as a winter bird of passage. It spends the summer in the northern parts of Europe and Asia, and even occurs in Iceland; its winter range extends to the Mediterranean. In size, it is somewhat smaller than the Song Thrush or Mavis. The general color is a rich clove-brown on the head, upper parts of the body, and tail; the wing-feathers darker, but with lighter external edges; the lower parts mostly whitish, tinged and streaked with brown; the under wing-coverts and axillary feathers bright reddish-orange. The R. arrives in Britain rather earlier than the Fieldfare (q. v.), and like it, congregates in large flocks. It has an exquisite song, which it pours forth from the summit of a high tree, gladdening the woods of the north.

RED-WOOD, the heart-wood of *Adenanthera pavonina* (*Leguminosæ*), a large tree growing in India, where it is called *Rakta-chandun*, and is much used in dyeing red. Small quantities are brought to this country for the same purpose, but it is not in much demand.

REE, LOUGH, a lake in the middle of Ireland, between Connaught on the west and Leinster on the east, is an expansion of the river Shannon (q. v.).

REED, the common English name of certain tall grasses, growing in moist or marshy places, and having a very hard or almost woody culm. The COMMON R. *Phragmites communis*, formerly *Arundo Phragmites*) is abundant in Britain and continental Europe, in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The culms are 5—10 feet high, and bear at the top a large much branched panicle, of a reddish-brown or yellowish-color, having a shining appearance, from numerous long silky hairs which spring from the base of the spikelets. The two outer glumes are very unequal; and the spikelets contain 3—4 perfect florets, with a barren one at the base. The culms, or stems, are used for making garden-screens, for light fences, for thatching houses and farm-buildings, for making a frame work to be covered with clay in partitions and floors, for battens of weavers' shuttles, &c. So useful are reeds in these ways, and particularly for thatching, that it is found profitable in some places to plant them in, old clay-pits, &c. Probably they might be planted with advantage in many peat-mosses, where they are now unknown. The plant is not very common in Scotland; but in the fenny districts of the east of England, it covers large tracts called *reed-ronds*, and similar tracts occur in many parts of Europe.—Nearly allied to this is *Arundo donax*, the largest of European grasses, plentiful in the south of Europe, and found in marshy places as far north as the south of the Tyrol and of Switzerland. It is 6-12 feet high, and has very thick, hollow, woody culms, and a purplish yellow panicle, silvery and shining from silky hairs.

The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarionets, mouth-pieces of oboes, &c. They are also made into walking-sticks and fishing-rods. The creeping roots contain much farina and some sugar.—*Arundo Karka* is supposed to be the grass called *Sur* in Sindh, of which the flower-stalks are very fibrous; and the fibres being partially separated by beating, are twisted into twine and ropes.—The SEA REED is *Ammophila* (q. v.)—or *Psamma-arundinacea*.

REED. See LOOM.

REED, in Music, the mouth-piece of a hautboy, bassoon, or clarinet. Also, a piece of metal with a brass spring or tongue attached to it in such a way that the admission of a current of wind causes it to vibrate and sound a musical note. The reed is of two kinds, the *beating* reed and *free* reed. The former is used in the reed-pipes of an Organ (q. v.), and requires to be placed within a tube in order to produce a musical sound. It consists, as in fig. 1, of a metallic cylinder *a*, with the front part cut away, and a brass spring or tongue *b*, placed against the opening, and attached at the upper end. The admission of air to the pipe in which the reed is placed causes the tongue to vibrate against the edge of the opening, so as to cover and uncover the slit, through which the air passes to the pipe above, the regularly repeated

beat producing a musical note, dependent for its pitch on the length of the tongue, which is regulated by a strong spring of wire *c*, pressing against it. The quality of the sound is determined to a large extent by the length and form of the pipe in which the reed is placed. The *free* reed differs from the beating reed in this, that the tongue is a little smaller than the opening, and strikes, not the edge of the opening, but the air.

The admission of a current of wind causes it to yield so as to let the air pass, while, after recovering its position, it is carried back by its momentum equally far on the other side, and continues vibrating so long as the current of air is continued, the result of the pulsations being a musical note. The invention of the

Fig. 1.

Fig. 2.

free reed has been ascribed to M. Grenié, a Frenchman, who brought it into use, but it has been long known to the Chinese. Its note is more smooth and mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter. Besides being occasionally adapted to organ-pipes, it is used without a pipe in the Harmonium (*q. v.*), as represented in the subjoined fig. 2, where *a* is the brass frame containing the slit, *b* the reed in the frame, while *c* represents the position of the reed in the instrument, it being a little below the slit, when not in motion.

REED MACE. See **TYPHA**.

REED WARBLER. See **WARBLER**.

REEF, in naval matters, is a portion of a sail included between the bottom of the sail and a parallel row of eyelet-holes a short distance above it, or between such row of eyelet-holes and a parallel row higher up. The object of the reefs is to reduce the size of the sails when the wind becomes boisterous. For this purpose, cords are inserted at each eyelet-hole, which, when the sail is unreefed hang freely. When the intention is to take in a reef, the sail is slightly lowered; the men climb out along the yard or boom below its lower edge, fold the loose sail on the yard, and fasten the reefing-lines securely round the yard and sail thus folded. There are also systems of small ropes in some ships by which the sail may be reefed from the top without the men incurring the danger of going out on the yard during tempestuous weather.

REEL, a lively dance peculiar to Scotland, which may be danced by two couples, but admits a greater number. The music is in general written in common time of four crotchets in a measure. but sometimes in jig time of six quavers.

REEL-WINDING MACHINE, a beautiful contrivance, now used by the manufacturers of sewing-thread. It is for the purpose of winding the thread on to the reels upon which it is sold for use; and not only does it turn a number of reels round so as to wind the cotton upon them, but, by a peculiar arrangement, every turn is so managed that the cotton is reeled with the most beautiful regularity, each turn of the thread being laid on by the side of the previous one, and never crossing it.

RE-ENTERING ANGLE, in Fortification, is an angle in the line of works of which the apex points away from the front. As an example, the flanks of a bastion make re-entering angles with the adjoining curtains. Advantage is commonly taken of the comparatively sheltered position of these angles to form *places d'armes* for the assembly of troops.

RE-ENTRY, is a legal term used in leases, whereby the landlord stipulates for power to re-enter the premises in certain conditions, such as the non-payment of rent after the lapse of a specified period from the time it became payable. Before, however, the power of re-entry can be exercised, all the conditions must be strictly complied with.

REEVE (*Sax. gerefa*, Ger. *graf*), a magistrate existing in early times in England and elsewhere in Northern Europe, whose duties were at first principally fiscal. In the Saxon period in England,

he represented the lord of a district, whether township or hundred, at the folk-mote of the county; and within his district, he levied the lord's dues, and performed some of his judicial functions. The word still survives in the shire-reeve or sheriff (*scyr gerefa*), who was at first assessor to the ealdorman or earl, who along with the bishop, presided, but afterwards became himself the presiding officer. Similar functions were exercised in boroughs by an elective officer called the Portreeve. In Anglo-Saxon times all the English boroughs were subject to the rule of a portreeve, for whom the Norman conquerors substituted a bailiff, who, in the larger towns, was allowed to assume the appellation of mayor.

REEVE, a verb used in speaking of ropes, signifies the passing of a rope through any hole, dead-eye, block, or pulley, in conjunction with which it is to be used.

REEVES, **SIMS**, an eminent tenor singer, born at Woolwich in 1821. Before attaining his fourteenth year, he was a clever performer on various instruments, and tolerably well versed in composition; and at that early age he was appointed organist and director of the choir of North Cray in Kent. His musical education was conducted under J. B. Cramer, T. Cooke, and other artists of note. He first appeared in public as a baritone at Newcastle in 1839. His *début* was a complete success; and he acquired fresh fame in Scotland and Ireland. In order to perfect his voice and style, he went to Paris, and after studying there for some time, appeared at Milan in the tenor part of Edgardo in *Lucia di Lammermoor*, when his singing electrified the audience. He returned to England in 1847, and coming out at Drury Lane as Edgardo, was immediately recognized as the first living English tenor, and was engaged in 1848 at Her Majesty's Theater. In 1851, he was equally successful as first tenor at the Italian Opera in Paris. One of his best original parts was in Macfarren's opera of *Robin Hood*, produced in 1860.

REFERENCE, as a legal term, means the sending by a court, or by agreement of the parties, the decision of a matter to an arbitrator, or to an officer of the court or master. In cases where parties, without going the length of commencing litigation, agree to arbitration, they usually execute a deed or agreement of submission; but after litigation has begun, if the judge think it would be better that an arbitrator should settle the dispute, an order of reference is drawn up for that purpose.

REFERENDARY, a name given in the early kingdoms of Europe to a public officer, whose duty was to procure, execute, and despatch diplomas and charters. The office of Great Referendary to the monarchy of France merged eventually in that of Chancellor.

REFINING OF METALS. The last operation connected with the smelting of copper, tin, lead, and some other metals, is usually called the refining process. With copper, for example, the impure or 'blister' copper, containing from 95 to 98 per cent. of the metal, alloyed usually with small quantities of iron, tin, antimony, &c., is melted in a refining furnace, and exposed to the oxidizing influence of the air. By this means, the foreign metals present become oxidized, and rise to the surface as slag, which is skimmed off; the oxide of copper, formed during the process, being afterwards reduced by throwing coal on the surface of the melted metal, and stirring with a pole of green wood. The disengagement of gases from the wood during the 'poiling' causes the metal to splash about, and so expose every portion of it to the reducing action of the coal; thus the oxide of copper is deprived of its oxygen, and the copper rendered nearly pure.

Tin is also refined by throwing billets of green wood into it while in a melted state, which has the effect of bringing impurities to the surface as froth, in a somewhat similar way to the oxidizing of foreign metals in copper. See **TIN**.

Lead is purified from antimony and tin by an analogous mode of oxidation, and silver is separated from it by a special process. See **LEAD**.

The refining of iron is a name applied to the process for partially separating the carbon from cast iron, and is described under **IRON**. Of the less important metals used in the arts, zinc, antimony, and mercury do not usually undergo any special refining process; aluminium, it is said, will not afterwards purify when once reduced to the metallic state; and nickel, of which German silver is largely composed, is refined by a process or processes kept strictly secret by manufacturers.

We may state here that no metal is ever quite pure in its commercial state, even though it has gone through the usual operation of refining, but all are to a certain extent alloyed with certain others. For the great majority of purposes, it is not necessary that metals should be chemically pure, and when it is, they can only be made so by refined chemical processes.

It will be readily understood, however, that it is always necessary to carry the refining of gold and silver further than the less valuable metals. To render gold sufficiently pure for manufacture into coin, an ingenious process has, within the last few years,

been proposed, by which fused gold is mixed with about 10 per cent. of black oxide of copper, and then stirred so as to oxidize any foreign metals which happen to be present. The oxide of copper does not fuse, but is disseminated through the melted metal, and oxidizes any tin, antimony, or arsenic, and causes them to rise to the surface, so that they may be skimmed off. Perfectly pure gold is prepared by dissolving the metal in aqua-regia—a mixture of nitric and hydrochloric acids—and precipitating silver (with which it is almost always alloyed) as well as any other foreign metals by chemicals which have no action on the solution of gold. The metallic gold is afterwards precipitated as a finely-divided powder, by a salt of iron, and is then fused and cast into bars.

Silver is rendered pure by dissolving it in nitric acid, filtering the solution, and then precipitating the metal with common salt as a chloride of silver. This is afterwards mixed with sulphuric acid, and then, by introducing bars of zinc, a chloride of zinc is formed, whilst the silver is reduced to the metallic state.

REFLECTION. See CATOPTICS, HEAT, UNDULATORY THEORY. In the articles referred to, the laws of reflection are stated, illustrated geometrically, and deduced from the modern theory of the nature of light and radiant heat.

We may now mention one or two curious circumstances connected with reflection, which could not be well given in any of these articles.

In general, a reflected ray is more or less *polarized* (see POLARIZATION); and if the reflecting surface be metallic, or if it be formed of a substance of high refractive index, as diamond, it is in general *elliptically* polarized.

In various cases, principally known by the laborious investigations of BREWSTER (q. v.), the *color* of the reflected light not only differs from that of the incident light, but is different for different angles of incidence, and for different azimuths of the plane of reflection. The theoretical explanation of these very singular facts has not been as yet very satisfactorily given. In fact, the problem of reflection from the surface of a metallic or a crystalline substance is one which presents difficulties of a very formidable kind, principally from the want of definite data for the formation of a satisfactory fundamental hypothesis; and, in a secondary manner, from the intricacy of the requisite mathematical investigations.

REFLEX ACTION. See NERVOUS SYSTEM.

REFORM, PARLIAMENTARY, the name generally given to the acts which passed the legislature of the United Kingdom in 1832, by which an extensive change was made in the system of parliamentary representation. Parliamentary reform had for many years before been a topic of popular agitation. So far back as 1782, a motion by Mr. Pitt for a reform of the franchise was lost by a majority of 20, and similar motions in the years 1785 and 1785 by majorities of 44 and 74. The horror inspired by the excesses of the French Revolution caused a reaction, and the repression for a time of all liberal tendencies; and it was not till some time after the close of the French war that the desire for reform again manifested itself. Mercantile distress had added to the popular dissatisfaction, which was fomented by the revolutions of 1830 in France and Belgium; and an adjustment of the inequalities of the representative system, with an extended franchise, was looked forward to as a panacea for all the ills under which the community labored. The demand for parliamentary reform became more imperious on the death of George IV. and accession of William IV. Meetings were held over all the country, and though there was no open rioting, a constant alarm was kept up. On the resignation of the Duke of Wellington, November 16, 1830, the celebrated Reform ministry of Earl Grey came into office. Parliament assembled on February 3, 1831, and on March 1, Lord John Russell proposed his first scheme of Reform. After a long and animated discussion, the bill passed the second reading by a majority of 1. On the motion for a committee General Gascoyne moved, as an amendment, that the number of representatives for England and Wales should not be diminished; and the amendment being carried by a majority of 8, the ministry abandoned the bill, and resorted to a dissolution. The cry arose through the country of 'The bill, the whole bill, and nothing but the bill'; and when the new parliament assembled on June 14, a large majority including the whole of the county members for England, excepting four or five, were pledged to support the bill, which was again introduced on June 24, and passed the third reading in the House of Commons by a majority of 113. The Upper House, however, threw it out on the second reading by a majority of 41, and parliament was immediately prorogued. It reassembled on December 6, and on December 12 the third Reform Bill was introduced in the Commons by Lord John Russell, which did not like the former bills, diminish the number of members—a concession which the Opposition considered as an improvement, and it had a majority of 116 on the third reading.

In the Lords, the second reading was carried by a majority of 9, and the bill ordered to be committed. In committee, Lord

Lyndhurst carried, by a majority of 35, a motion that the disfranchising clause should be postponed, and the enfranchising first considered; on which, the king having refused to accede to a creation of peers sufficient to carry the bill, the ministry resigned. A week of intense public agitation followed. The government were induced to resume office on the king granting them full powers to secure majorities by the creation of peers; but eventually that expedient was avoided by a sufficient number of Lords absenting themselves to leave ministers a majority on the third reading, when the bill passed by a majority of 84, receiving the royal assent by commission on June 7, 1832. Reform bills for Scotland and Ireland were immediately afterwards introduced and carried. For the details of the alterations made by these several measures on the distribution of members and the electoral qualification, see PARLIAMENT. The changes effected were so sweeping as to cause many of the advocates of Reform to be apprehensive that the balance of the constitution would be disturbed by the preponderance of the democratic element; but the determination of the masses was such, that the conservative influences of the country were powerless to stay or modify the measure. Yet no sooner was the contest at an end, than a reaction followed, falsifying equally the hopes of the supporters of the bill, and the fears of its opponents.

In 1854, a new Reform Bill was introduced by Lord John Russell for a further extension of the suffrage; but it was unaccompanied with anything like popular excitement, and was withdrawn in consequence of the breaking out of the Crimean war. A Reform Bill brought in by Mr. Disraeli in 1859, was rejected in the Commons by a majority of 89, and the consequence was a dissolution and change of ministry. The succeeding ministry of Lord Palmerston introduced and afterwards withdrew a Reform Bill.

No one, remembering amidst what apathy that took place, would have expected, within so few years, to see the subject revive, and assume such large dimensions. Mr. Gladstone's speech of 1864 first gave new life, and his declaration, that it lay with those who refused the elective franchise to justify the refusal, sounded the commencement of the new agitation. At the general election of 1865, reform was necessarily much discussed. The death of Lord Palmerston gave the country a ministry in which Lord Russell led the House of Lords, and Mr. Gladstone led the House of Commons. This ministry was not long in attacking the subject, and the reform discussions of 1866, so valuable as preparing for the final settlement of the question, commenced. The ministry adopted a suggestion which Mr. Bright had made, and tabled first a bill dealing with the franchise alone. Its proposals were of a moderate enough description, its leading provisions being to give the franchise to occupiers of premises of the annual value of £7 in boroughs, and of £14 in counties. At the desire of the opposition, led by Mr. Disraeli and Lord Stanley, government introduced its Redistribution of Seats Bill, and the two bills were combined and sent to committee together. In committee, parliament proved unmanageable. Several clauses were carried by the narrowest majorities, till at length, on the comparatively small question, whether 'clear' or 'rateable' annual value should be taken as the basis of the franchise, government was left in a minority of seven. The leaders, true to the traditions of party, resigned, and left the question of reform to the Conservatives. The resignation was beneficial to progress. In the autumn following it, numerous mass meetings, conducted in general with perfect order, were held; and some unlucky speeches of the opponents of any reduction of the franchise were employed more or less unfairly in order to get a starting-point for the kind of eloquence that such meetings require. It now became plain that the main drawback to reform, the alleged indifference of the working classes, had ceased to exist. Reform therefore became inevitable; and it was equally clear that if reform was to be carried by the Conservatives, the country would not accept from them a measure of the moderate character which it would have gladly taken from the Liberals shortly before.

The meeting of parliament in 1867, it is said, found the ministry of Lord Derby and Mr. Disraeli still undecided. But it was necessary to do something. The Queen's Speech accordingly broached the matter; and in the beginning of the session, Mr. Disraeli proposed to deal with the subject by way of resolution. His resolutions, however, were vague, and had to be withdrawn. Mr. Disraeli then (25th February 1867) made a speech, in which he proposed to bring in a bill, with a £6 rating franchise in boroughs, a £20 rating in counties, and with some of what were called 'fancy' franchises. With the redistribution question, he proposed to deal much as his actual bill afterward dealt. This proposed bill was understood to be a compromise with a section of the cabinet not favorably disposed to reform. However, as it did not succeed in making matters smooth, the leaders of the government are said to have reverted to what was their original policy. The dissentients, Lord Carnarvon, Lord Cranborne, and

General Peel, then resigned, and (on 18th March) the Reform Bill of 1867 was introduced.

The bill surprised the country. Mr. Disraeli has since said that, so far back as 1859, he and Lord Derby came to the conclusion, that if the £10 line, at which the Reform Act of 1832 had fixed the borough franchise, were disturbed, there was no other fixed line tenable; and he has made the further revelation, that he spent the interval between 1859 and 1867 in educating his party to the belief, that if the borough franchise was to be dealt with at all, it must be dealt with in the boldest manner. His bill, therefore, carrying out this policy, proposed that all householders within boroughs who were rated for the payment of poor-rates, should be entitled to vote. There were certain 'securities' attached to this proposal. The householder must have resided two years in the borough, and must have personally paid his rates. Further, the 'fancy franchises,' which again made their appearance, had coupled with them what was called the 'dual vote,' the object of which was to give to every householder who possessed one of them a second vote in addition to the first, which his house would give him. In counties, the bill proposed a £15 rating franchise, and all existing franchises were permitted to remain. In redistribution of seats, the bill proposed to take the second member from each borough of less than 7000 inhabitants, and to divide these seats, together with the seats taken from the corrupt boroughs, in nearly equal proportions between the larger counties and boroughs, giving one also to London University.

The bill was not permitted to pass without many alterations. Government, either influenced by a sincere desire for reform, or convinced that, as reform was at any rate unavoidable, it was better that it should pass under their management than under the management of their opponents, were quite resolved that a bill should pass. They yielded to the House whenever they well could, and when they could not, the threat of dissolution at once brought the house to reason. The result of the labors of the session admits of being shortly stated.

The borough franchise remained substantially as at first proposed. Much of the session was lost in devising clauses by which the rating principle could be applied to those tenants whose landlords compounded for their rates. The principle was, however, maintained; and an amendment introduced by Mr. Gladstone, with a view of fixing the hard and fast line of £5, was rejected. But by a new clause, the system of compounding was put an end to, so that the franchise was really given to all householders except those excused from rating on the score of poverty. The period of residence, on the motion of Mr. Ayrton, was reduced from two years to one. On the motion of Mr. McCullagh Torrens, an important addition was made in the shape of the lodger franchise. Mr. Disraeli's bill of 1859 had contained a provision of the kind, and something like it was again added. It gives votes to all lodgers who have occupied for a year lodgings which would let unfurnished for £10, and who apply to be put on the roll.

The county franchise was reduced from £15 to £12 rating; and there was added (on Mr. Colville's motion) a reduction of the copyhold and leasehold franchise, giving votes to all owners or freeholders of the free annual value of £5 in property other than freehold, which continues to yield a 40s. franchise.

The dual vote was early abandoned, and its abandonment involved that of the 'fancy' franchises. These have now only interest as matters of history; but as the name appears often in the discussions, it should be mentioned that, in their last form, they proposed to give votes to all who paid £1 annually in direct taxes (not including licenses), who belonged to certain of the better educated professions, or who had £50 in a savings-bank or in the funds. Mr. Mill's proposal to extend the franchise to women found 73 supporters. The vote by ballot was rejected, equally with the government proposal to take the vote by means of voting-papers.

The comparatively restricted proposals of the government with regard to redistribution of seats were considerably extended. On Mr. Laing's amendment, the limit at which boroughs then returning two members should hereafter return only one, was raised from 7000 inhabitants to 10,000. This gave 38 seats to be distributed,* making, with the 7 seats forfeited for bribery by the boroughs of Lancaster, Yarmouth, Reigate, and Totnes, 45 in all. Of these, 25 were given to the larger counties, which were severally divided into two or more districts for the purpose.† To boroughs, 19 new members were given—8 by way of additional

* The boroughs from which one member each was taken were Andover, Bodmin, Bridgenorth, Bridport, Buckingham, Chichester, Chippenham, Chipping-Wycombe, Cirencester, Cokermonth, Devizes, Dorchester, Evesham, Great Marlow, Guildford, Harwich, Hertford, Honiton, Huntingdon, Knaresborough, Leominster, Lewes, Lichfield, Ludlow, Lynton, Maldon, Marlborough, New Maldon, Newport (Isle of Wight), Poole, Richmond, Ripon, Stamford, Tavistock, Twickenham, Thetford, Wells, and Windsor.

† West Kent, North Lancashire, East Surrey (already having two members each), and South Lancashire (already with three members), were subdivided, and two members given to each division, which absorbed 7 seats; and the counties of Chester, Derby, Devon, Essex, Lincoln, Norfolk, Somerset, and Stafford, together with the West Riding (all already in two divisions, with two members each), were divided into three parts, each represented by two members, which absorbed the other 18 seats.

members to boroughs already possessing members, and 11 to new boroughs.‡ To the University of London, one member was given. Mr. Laing's proposal to make the scheme of redistribution still more extensive, by applying to all boroughs having fewer than 5000 inhabitants the system of grouping which prevails in Wales and Scotland, was rejected.

The only amendment of importance which the House of Lords succeeded in making, was the addition of the system of representation of minorities. By this system, persons voting in London, where four members are returned, cannot vote for more than three; and in the counties and boroughs which return three members, cannot vote for more than two. The object is to prevent a majority which may possibly exceed the minority by only one man, from monopolizing the whole representation. The plan appeared first in Lord John Russell's bill of 1854, and having then been unpopular with both sides, does not appear to have been proposed since. Mr. Disraeli took occasion, in introducing his bill, to declare himself against it. Mr. Lowe proposed to add it in the Commons; and his proposal was supported by such men as Lord Cranborne among the Conservatives, and Mr. Mill and Mr. Fawcett among the Liberals. Mr. Bright joined the government in opposing it, and it was lost by a majority of 141. In the House of Lords, its insertion was again proposed by Lord Cairns, and carried by a very large majority, most of the Conservatives voting for it, against the government. When the Lords' Amendments were considered in the Commons, it was the only one of them which was agreed to. It is hardly necessary to say that a scheme such as that of Mr. Hare, for carrying out the principle in a rigorous and complete manner, was found to be far in advance of the day.

The opportunity of passing the Reform Bill was taken to provide for some minor improvements. The inconvenience of having parliament dissolved by the demise of the crown was obviated, and it was provided that ministers of the crown and their subordinates changing from one office to another should not have to submit to re-election. A boundary commission was appointed to re-adjust the boundaries of the boroughs and counties. Mr. Fawcett's proposal to throw the necessary expenses of elections, such as the expenses of polling-places, sheriffs, &c., on the borough or county rates, was, however, rejected.

Such is the Reform Act (for England) of 1867. Its passing, in some shape or other, from the temper of the government and its power of controlling the House, was at no time in serious risk. The most critical period was when Mr. Coleridge's amendment was brought forward, with the view of making way for Mr. Gladstone's amendment of the £5 rating limit; and here the government were served by the defection from the Liberals of the 'tea-room' party—a large number of 'extreme' and 'independent' Liberals, some of whom really preferred the *quasi* household suffrage scheme of the government, and others of whom were only resolved that a bill of some kind should pass. Mr. Gladstone's amendment was thus defeated.

Acts similar to the English one were passed for Scotland and Ireland in the session of 1868. The borough franchise for Scotland is substantially the same as for England, being conferred on every man who has for twelve months occupied, as owner or tenant, any dwelling within the borough, except he has been exempted from poor-rates on the ground of inability to pay, or has failed to pay. Scotland has also the £10 lodger franchise. In Scottish counties, proprietorship to the extent of £5 of clear yearly value confers a vote; the limit of the tenant franchise is £14. The Scottish act disfranchised seven English boroughs, and gave seven additional representatives to Scotland—two of these being assigned to the universities, and the rest to larger towns and counties. The universities of Edinburgh and of St. Andrews return one member jointly; as do those of Glasgow and Aberdeen. The Irish act made no alteration in the county franchise, but reduced that of boroughs to a £4 rating occupation.

As thus chosen, the House of Commons was composed, in 1869, of the following representatives:

	Of Counties.	Cities and Boroughs.	Univer- sities.	Total.
England and Wales..	187	297	5	489
Scotland.....	32	26	2	60
Ireland.....	64	37	2	103
United Kingdom, 283		360	9	652

REFORMATION. The *Reformation* denotes the great spiritual and ecclesiastical movement which took place in Europe in the 16th c., and as the result of which the national churches of Britain, of Denmark, Sweden, Norway, and Holland, and of many

‡ Birmingham, Leeds, Liverpool, Manchester, Merthyr-Tydfil, and Salford got each an additional member. The Tower Hamlets were subdivided, and got two additional members. Chelsea was made a borough, returning two members; and the following boroughs were appointed to return one each: Burnley, Darlington, Dewsbury, Gravesend, the Hartlepoons, Middlesborough, Staleybridge, Stockton, and Wednesbury.

parts of Germany and Switzerland, became separated from the church of Rome. In other countries, such as Hungary and France, the same movement detached large portions of the population from the Roman Catholic faith, yet without leading to a national disruption with the papacy.

The causes of this movement were manifold; but, as may be supposed, they present themselves in very different lights to members of the different religious communions.

To Protestants, the Reformation appears as the natural result of causes which had long been at work, and which it needed but a fitting occasion to call into active operation. The church of Rome had gradually, from the 6th c., or the time of Gregory the Great, extended not merely its influence, but its direct control and government, over all the countries of Western Europe—in many places, as in Ireland, Scotland, and part of England, displacing the old national churches, which had been planted in earlier times, and which had survived under comparatively simple forms of government. Although some uncertainty may exist as to the exact constitution, doctrine, and discipline of the old Scotch-Irish Church, there can be no doubt that it did not acknowledge the direct superintendence of Rome, and that it was only after a long and varying struggle, not terminating till the 12th c., that the popes fully established their authority, and set up over this ancient church a completed hierarchy connected with Rome. It is only by keeping this in view that some features of the Reformation can be clearly understood and appreciated.

The natural result of the wide-spread supremacy of the Roman Church was, that the spiritual aspects of the church became gradually more and more merged in its mere machinery of external government. Everything that could give power and efficiency to it as an institute was carefully watched and nursed; but when, in the course of the 15th c., and even earlier, spiritual life began to die out in the center of this vast system of ecclesiastical government in Rome itself, the baleful effects of such spiritual decay speedily began to tell through all its borders. The growing corruption showed itself in many forms—in a prevailing ignorance among the monks and higher clergy; in the perversion of ecclesiastical offices, and especially in the grossly materialistic abuse of spiritual privileges and censures. The ignorance of the monks is depicted in strong colors in the satires of Erasmus and Buchanan, and in such books as the *Epistola Obscurorum Virorum*. The great impetus which the friars had given to the papal power in the 13th c., had died out. They had sunk, from being zealous and active preachers, into bigots and mendicants, cumbering the ground. The secular clergy were hardly less corrupted; in many cases, the higher dignitaries of the church had no interest in the spiritual duties of their office, and gave themselves up entirely to the pleasures of a worldly life, or, at best, to the duties of political or military activity. The revival of the old classical literature in Italy—the spirit of what is called the *Renaissance*—accelerated this movement of spiritual decay. The papacy itself became half-pagan. The church was little cared for even as an organ of government; it was used as an engine of self-aggrandizement and the most extravagant luxury.

These general causes, however, might have proved inefficient to produce any such radical change as the Reformation; they had been long felt and deplored. Wycliffe in England, and Huss and Jerome of Prague had denounced, in the most vigorous manner, the prevalent abuses; they had excited a wide-spread popular interest, and even to some extent secured royal favor. But the overbearing power of the church proved too strong for the reforming spirit in its earlier manifestations. In the midst of his evangelical activity, Huss was betrayed, through the promise of a safe-conduct, into making his appearance at the Council of Constance in 1414. No sooner was he fairly in the power of the Council, than he was confronted with certain articles of abjuration; and refusing to submit without being convinced, he was, in defiance of the promise made to him, condemned to be burned as a heretic. The rising spirit of reformation was temporarily quenched in the flames which consumed the intrepid martyr of Bohemia. The Council did nothing effectual to repair the abuses which he had denounced. The church remained apparently strong after a temporary excitement and alarm.

In the meantime, however, throughout the 15th c., new seeds of preparation for the great work were everywhere ripening. The literary movement begun in Italy, was spreading in Germany, in England and elsewhere. Reuchlin arose in Germany, Erasmus in Holland; England welcomed the latter as a student in the early reign of Henry VIII., while he was engaged in preparing his edition of the Greek New Testament. Various manifestations of spiritual life showed themselves, especially in the Rhine country. The Brethren of the Common Lot took up in a more evangelical form the succession of the Brethren of the Free Spirit, whose teaching had degenerated into a species of spiritualistic pantheism. Gerhard Groot, and Thomas à Kempis, represent this comparatively evangelical tendency, and springing from them, various men—the best known of whom is John Wessel of Gröningen—

have been called 'Reformers before the Reformation.' If we add to these influences the internal political agitations of the Germanic empire—whose traditional opposition to the papacy was by no means forgotten—the growth of a healthy political activity in many of the great municipalities of the empire, we shall find abundant incitements to the Reformation in the social state of Europe, especially of Germany, and in the church in the beginning of the 16th century. It required only a definite spark to kindle the slumbering agitation, and this was not long wanting.

Whatever may be said of the doctrine of Indulgences as theoretically stated, it is not denied by the most zealous defenders of the institution that it has at all times been liable to the gravest abuse; and it so happened that at the period in question the abuse had risen to a scandalous height. See *INDULGENCE*. An agent of this system, of the name of Tetzel, a Dominican friar, came into Saxony in the year 1517, and established himself not far from Wittenberg, for the purpose of disposing of papal indulgences. He was a man of low and unscrupulous character, gifted with great volubility, and he carried on his traffic in a peculiarly offensive and shameless manner. Luther, who had been recently created a Doctor in the Holy Scriptures, and entered upon his career as a teacher in the university of Wittenberg, was roused to indignation by what he heard of the doings of this man. He saw the evil influence of the system upon the members of his own flock, and determined to raise his voice against it. 'God willing, I will beat a hole in his drum,' he exclaimed, with reference to the coarse vehemence with which Tetzel commended the value of his wares. He posted on the door of the church of Wittenberg his famous 95 theses, and thereby created such a popular excitement that Tetzel was silenced, and obliged to retreat from the field. This was the beginning of the Reformation in Germany. Luther's attention once aroused to the working of the papal system, he proceeded to examine it in different aspects, and the result was, that his resolution to assail it strengthened as he advanced. Neither cajoling nor threats, neither the bland softness of Cajetan, nor the blundering polemics of Eck, were of avail to silence him. A papal bull was at length fulminated against him; and he consummated his audacity by burning the bull at one of the gates of Wittenberg, on the memorable 18th December 1520.

About the same time, and without any concert whatever, a similar movement against the sale of indulgences took place in Switzerland. In 1520, the Franciscan friars, who had the charge of promulgating the indulgences there, were opposed by Zwingli, a preacher in Zürich. His opinions were declared to be heretical by the two great universities of Cologne and Louvain; but he declared himself unmoved by the voice of Catholic authority; the magistrates and the people of the city supported him; and the result was the active spread of the reforming spirit, not only throughout Zürich, but the neighboring cantons of Schaffhausen, Basel, and Bern.

In the meantime, Luther advanced in his work. He addressed the 'Christian nobles' of Germany, loudly declaring that the time to rise against Rome was come. 'Talk of war against the Turk,' he cried; 'the Roman Turk is the fattest Turk in the world; Roman avarice the greatest thief that ever walked the earth; all goes into the Roman sack which has no bottom, and all in the name of God, too!' Step by step, he opened his eyes to the errors of the papacy, and no sooner reached a new conviction himself, than he launched it forth into the world. He pronounced against the Seven Sacraments, in favor of only three—Baptism, the Lord's Supper, and Penance. He contended for the use of the cup to the laity. His rapid writings—no fewer than three—in the same year, which he closed by burning the papal bull (1520), circulated in thousands, and were eagerly read. Nearly all Germany was aflame with the new spirit, and it seemed as if the empire would be wholly lost to the papacy.

The interposition of Charles V. produced at this crisis a temporary interruption in the progress of Reformation. Charles was crowned Emperor of Germany in January 1521, and immediately summoned at Worms a diet of the sovereigns and states of the empire. The papal leaders exerted themselves to have Luther summarily condemned at the diet. They succeeded so far as to make the emperor issue an edict for the destruction of the reformer's writings; but the estates refused to publish it unless Luther was allowed an opportunity of meeting his adversaries under safe-conduct, and answering before the diet to the charges preferred against him. Luther was accordingly summoned to meet the assembled authorities of Germany at Worms. He gladly and proudly embraced the summons. His journey thitherward was a kind of triumphal procession, so enthusiastically did the people, and even some of the priests, greet him along the route. He is said to have entered Worms chanting 'Ein feste Burg ist unser Gott'—the *Marseillaise* of the Reformation, as has been remarked. The same night, however, the intrepid monk was heard in an agony of prayer in his room, overwhelmed by the solemnity of his circumstances. On the afternoon of the following day, he

made his appearance before the diet, and confronted its assembled statesmen and princes—a scene grand and striking in its features, which has been often painted. He was urged to retract; but he was immovable. In a speech, first in German, then in Latin, he expressed his determination to abide by what he had written, and called upon the emperor and the states to take into consideration the evil condition of the church, lest God should visit the empire and German nation with His judgments. A direct answer was demanded from him whether he would retract or not. 'I neither can nor dare retract anything,' he replied, 'unless convinced by reason and Scripture; my conscience is captive to God's Word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me, God. Amen.'

It was evident that Luther was not to be intimidated. He remained some days in Worms; but neither persuasion nor threatening availed with him. He received orders to depart; and in the end of April, he set out on his way home. As he left Eisenach a few days afterwards, and was passing through a narrow defile near the fortress of Altenstein, he was seized by two armed horsemen with attendants, carried to the neighboring castle of the Wartburg, and there lodged in safety. This apparently violent seizure was the friendly act of his sovereign, Frederick of Saxony, to protect him from the destruction that his intrepid conduct was certain to have called down upon him had he remained at liberty. The ban of the empire had followed him, and temporary obscurity was his only safety.

The Reformation suffered, however, from the absence of his guiding hand. Carlstadt and others, when left alone at Wittenberg, gave the rein to many excesses. Reform seemed likely to merge into license. The heart of Luther, after a year's residence in obscurity, was uncontrollably stirred within him to be at his old post again, directing and controlling the spirit of innovation; and he returned to Wittenberg in March 1523. The lawless movement, however, which had received impulse, was not to be restrained. It broke out in many quarters. Social oppression and misery added to the flames of fanaticism. The peasantry rose in arms, headed by the Anabaptist Münster, and the horrors of a civil war raged throughout Germany. Luther exerted all his influence to stem the unhappy tide of affairs; exhorted the nobles on one hand, and the peasants on the other; and at no part of his career did he show a higher spirit and wisdom, although he has not always got the credit of this.

With his hands thus full of practical labor, he plunged at the same time into a violent controversy with Erasmus, which by no means reflected so much credit on him. Erasmus and he had hitherto, although in different ways, co-operated in the same cause; but they were men of such different spirit and temper, that a separation between them was inevitable. Luther had felt this for some time, but he was reluctant to come to an open breach. 'Do not join your forces to our adversaries; publish no books against me, and I will publish none against you,' he had said in a letter in 1524. On the publication, however, of Erasmus's treatise *De Libero Arbitrio*, Luther could no longer hold silence. He responded in the same year, 1525, by his counter-treatise, *De Servo Arbitrio*; and the war of words waged hotly and vehemently between them. Luther was not only hearty but violent in denunciation; his indignation sunk into coarseness, while the audacity of his logic plunged him into unguarded and even immoral paradoxes, which left him gravely open to the cold and telling sarcasms of his opponent. He was evidently himself little satisfied with the result, and even his warmest admirers cannot see much to admire in the spirit and zeal which he manifested on this occasion.

Hitherto, the Reformation had not received any legal establishment. Frederick of Saxony, while warmly protecting Luther and his followers, did not yet take any steps to displace Romanism by legal enactment, and set up in its stead a Reformed Church. This was now done, however, by Frederick's successor. He commissioned Luther and Melancthon to prepare a new form of church government and church service for his dominions. His example was followed by the other princes and states in Germany that had renounced the papal supremacy. The Reformation thus obtained substantive existence and civil support. It was no longer merely a spiritual movement, it became henceforth also a political power. This important result showed itself conspicuously at the Diet of Spire in 1526.

An endeavor made at this diet to suppress the new religious movement, and to insist upon the rigorous execution of the papal sentence against Luther and his followers, was successfully opposed by a majority of the princes and representatives of states; and it was resolved, on the contrary, that the princes should have full power to order ecclesiastical affairs in their own dominions as they thought proper. This resolution served greatly to extend the Reformation. The emperor was too busy for some years with his own affairs to be able to interfere with the course of events; and the reforming cause was in the meantime greatly strengthened and advanced in various states of Germany.

This period of progress and tranquillity, however, was soon interrupted. A new diet was convoked at the same place in 1529; and under the more powerful influence of the papal party, backed by the presence of the emperor's brother, who presided in the diet, the measures of the former diet were recalled, and all changes in religion declared to be unlawful except such as might be authorized by an approaching General Council. It was then that the Elector of Saxony, the Landgrave of Hesse, and other princes of the empire who had already embraced the Reformation, and established it in their dominions, made a solemn *protest* against the action of this diet—a circumstance which gave rise to the name of *Protestants*, which has since attached to all the followers of the Reformation. See *PROTESTANT*.

While the Reformation thus ran its course in Germany, and was adopted by the civil authorities in many states, it was making corresponding progress in Switzerland, and there at length also, after a famous and elaborate conference held at Bern in 1528, under the countenance of the civil authorities, the supremacy of the pope was abolished, and the Reformed doctrines, in even a broader and more definite shape than in Germany, were declared to be the only doctrine of Scripture. Bern, Zürich, and Basel continued to be the main centers of the reformed movement in Switzerland; but the reformed doctrines gradually extended throughout the great majority of the cantons. Chiefly those surrounding the Lake of Lucerne remained, as they remain to this day, strongly attached to the Roman Catholic faith. The chief point of difference between the reformers in Switzerland and Germany concerned the doctrine of the Eucharist. Luther, while abandoning the doctrine of a literal conversion of the bread of the Eucharist into the body of Christ, known under the name transubstantiation, held to a modification of this doctrine, under the name of consubstantiation. The bread did not become the body of Christ literally, but it contained the body of Christ. Christ was in the bread as really 'as the sword in the scabbard or the Holy Ghost in the dove.' Zwingli, on the contrary, and his co-reformers in Switzerland, discarded all outward presence of Christ in the Eucharist. The service, in their view, was merely memorial. 'It is the spirit that quickeneth; the flesh profiteth nothing;' a passage which they applied to prove the worthlessness of any supposed eating of the body of Christ, even if such a thing were possible.

The dispute which arose on this subject between the reformers of Germany and Switzerland, and especially between their respective leaders, Luther and Zwingli, proved a serious impediment to the cause. Philip of Hesse sought to bring about a reconciliation between them. Zwingli, Bucer, and Oecolampadius met with Luther and Melancthon at Marburg in the year 1529, on his invitation, and held a long conference, but without any result. Luther was not to be moved in a matter which he held to be of the very essence of the Christian faith. The combatants separated with their opinions unchanged.

When Charles V. perceived the firmness of the Protestant princes in the position which they had taken up, he became anxious for temperate and conciliatory measures. In an interview with the pope at Bologna, he urged, but without success, the necessity of a General Council, and at the same time took means to convene personally with the princes at a new diet to be held at Augsburg. In the view of this important convention, the reformers prepared, at the instance of the Elector of Saxony, a statement of their special doctrines. The basis of this, the famous *Confession of Augsburg*, was seventeen articles, delivered by Luther to the elector at Torgau, which had been adopted at a conference at Schwabach in 1529. These articles, enlarged and polished by the careful and moderate pen of Melancthon, were submitted in twenty-eight chapters to the diet which met at Augsburg in June 1530. Twenty-one chapters were occupied with the statement of the opinions of the reformers, and the remaining seven devoted to an exposure of the errors of popery. The reading of this Confession by the Chancellor of Saxony, in name of the Protestant states, made an earnest and favorable impression upon the diet. The papal authorities submitted a reply, which was approved by the emperor, and ordered by him to be accepted as a conclusion of the religious differences which had arisen. The Protestants responded instead by an answer to the papal document, which was afterwards expanded by Melancthon, and published under the title of *Apology for the Confession of Augsburg*.

The religious schism between the emperor and many of the states of Germany seemed now approaching a crisis which could only terminate in war. A renewed decree exceeding in severity that of Worms, was launched against the reformers. They on their part appreciated the solemnity of the crisis, and met, headed by the Elector of Saxony, first at Smalkald, and then at Frankfurt, in the years 1530 and 1531, when they entered into a treaty of defensive alliance, and encouraged each other in the resolution to maintain their religion and liberties against the threatened encroachments of the imperial edict. To Henry VIII. of Eng-

land, who was at that time just beginning his own erratic career of reformation, they sent a special invitation to co-operate with them, on the basis of the doctrines of the *Confession of Augsburg*, an invitation to which he responded, but which issued in no practical result. The emperor, notwithstanding the strongly hostile attitude which he had assumed, was not prepared as yet to plunge into hostilities. The Turks were menacing the frontier of the empire; he had his own personal objects to gain in the advancement of his brother Ferdinand to the dignity of king of the Romans, an object which he could not accomplish without a majority of votes at an imperial diet. He was content, therefore, to enter anew into negotiations with the Protestant princes; and after many unavailing projects of reconciliation, a treaty of peace was concluded between them at Nürnberg in 1532. The Protestants agreed to support him against the Turks, and to acknowledge Ferdinand as king of the Romans; while the emperor in his turn agreed to abrogate the edicts of Worms and Augsburg, and allow the Protestants the free exercise of their religion until some settlement by a General Council or a diet of the empire.

It was the emperor's necessities, and not his will, which consented to the peace of Nürnberg; there was no prospect, therefore, of its being lasting. But the Protestants availed themselves of their temporary repose to strengthen themselves and extend their power. The emperor continued to urge the pope to convoke a General Council. At length, in 1536, Paul III. issued a summons for a council to meet at Mantua in the following year; but the Duke of Mantua being disinclined to receive so many turbulent guests into his quiet city, the project did not take effect. In anticipation, however, and convinced that no council convened under the exclusive influence of the pope would deal fairly with the subject in dispute, the Protestants met at Smalkald in the year 1537, and while solemnly protesting against a mere Italian or papal council, at the same time agreed to a new summary of their doctrines, drawn up by Luther, to be presented to the assembled bishops. This summary is known under the name of the *Smalkald Articles*, and along with the *Confession of Augsburg* and the *Apology for the Confession*, constitutes to this day the doctrinal basis of the German Lutheran Church.

At length, in 1546, the same year in which Luther, worn out by his many toils, died somewhat suddenly at Eisleben, a council assembled at Trent. It was soon evident that no compromise was practicable between the Protestant and the papal party, and both sides prepared to try the venture of war. When the Council of Trent promulgated its decrees, and the Reformed princes in the Diet of Ratisbon protested against their authority, the emperor raised an army to compel their obedience. They, on their part, were ready with their forces, and marched into Bavaria against the emperor. The results, in the first instance, were severely disastrous to the Protestant cause, chiefly through the division of the princes, and especially the perfidy of Maurice, the nephew of the Elector of Saxony. Various attempts at reconciliation and compromise were again attempted, in which Melancthon took a prominent part; but, as before, they came to nothing. A change of fortune gave a temporary triumph to the Protestant arms, and the result was that Charles concluded a formal treaty at Passau, in 1552, which may be considered the foundation of the Protestant liberties of Germany.

The Protestants stipulated for the free exercise of their religion, until the meeting of a diet which should settle a permanent religious peace; and in return, they agreed to lend assistance against the Turks, who were still menacing the frontiers of the empire. The promised diet assembled at Augsburg in 1555, and framed articles for the religious pacification of Germany, according to which all adherents to the Augsburg Confession of Faith were left in the undisturbed enjoyment of their rights which they had acquired, were freed from papal domination, and allowed to order their religious concerns as seemed best to them; Protestants and Catholics alike being bound to respect each others' convictions, and not to injure or persecute one another on account of religion, under penalty of being proceeded against as enemies of the empire. This treaty of Augsburg terminates the period of the Reformation in Germany.

In the neighboring countries of Denmark and Sweden, the progress of reformed opinions had proceeded still more rapidly than in Germany. In both these countries the sovereigns took the lead in enlightening their people, and freeing them from the tyranny of the church of Rome. In Sweden particularly, Gustavus Vasa showed both great courage and prudence in carrying out a reforming policy. He invited learned Lutheran teachers into his dominions, and showed special zeal in the circulation of a Swedish version of the Scriptures, made by one of these teachers, named Olaus Petri, who occupies the most prominent place among the Swedish reformers. At an assembly of the states at Westeraas, in 1527, while the reformers in Germany were still struggling for bare existence, it was unanimously resolved that the Lutheran doctrines should be adopted in Sweden, and a Reformed Church, entirely independent of Rome, established. The

same result occurred in Denmark in 1539, when an assembly of the Danish states at Odensee gave formal sanction to a plan of religious doctrine, worship, and discipline, drawn up by Bugenhagen, a disciple and friend of Luther, whom Christian III. had invited from Wittenberg for the purpose.

In France, the progress of the Reformation was of a much more uncertain and wavering character. As early as 1523, the new doctrines had spread greatly in many parts of France, under the countenance of Margaret, queen of Navarre, sister of Francis I., the constant rival of Charles V. The names chiefly associated with this early phase of the French Reformation, besides that of Margaret herself, are those of Lefevre and Farel, the latter particularly a man of active and fiery zeal, who had been originally a priest in Dauphiné, and whom we find subsequently associated with Calvin in Geneva. The university of Paris became for a time strongly infected with the 'new learning,' and many of the nobility, as well as the people, were actually inclined to throw aside the superstitions of Rome, and embrace a more scriptural form of faith. But the violent and inconsistent policy of Francis I., and the fierce spirit of faction which the struggle engendered, gave an unhappy turn to the course of events in France, and prevented the Reformation from obtaining in that country anything of the same national recognition that it obtained in Germany and elsewhere. Both Farel and Calvin were driven by the violence of persecution into Switzerland. The latter settled for a time at Basel, where he completed and published the first edition of his *Institutes*. The famous preface, addressed to Francis I., bears the date of Basel, August 1, 1535. In the following year, he repaired to Geneva, where Farel, already laboring in the work of the Reformation, retained him by a 'divine menace,' and he began that great career as a reformer, theologian, and legislator which has rendered his name so illustrious.

In Spain and in Italy, the spread of the Reformation, which in both countries had taken an active and hopeful start, was almost entirely suppressed by the power of the Inquisition. The church of Rome was able to bring its whole force to bear upon these countries, unchecked by political hostility. The flames of martyrdom, which elsewhere seemed to kindle a double zeal for the cause which they aimed to destroy, were here kept burning with such an incessant and devouring cruelty, as to consume all life out of the new movement, and brand the name of Protestant with the infamy which, in the popular mind, always attaches itself to hopeless failure.

The same policy was attempted in the Netherlands. Upwards of 100,000 of the inhabitants are said to have fallen under the atrocious cruelty of Charles V., and his son, Philip II. But the spirit of political freedom and moral earnestness proved at length an equal and finally, through a protracted and bloody conflict, a victorious match for the blood-thirstiness even of Philip and Alva; and the principles of the Reformation, after a Calvinistic type, were at length established in the United Provinces, along with the political supremacy of the House of Orange.

The Reformation in England is marked by peculiar features—an under-current of popular movement, dating even from the time of Wycliffe, and a somewhat inconsistent and wavering series of political changes during the reigns of the three Tudor princes, Henry VIII., Edward VI., and Elizabeth. In the beginning of the 16th c., as early as the first movements of Luther, there are indications of a revival of evangelical religious life among the tradesmen of London, and the peasantry in different parts of the country, particularly in Lincolnshire. The popular mind had begun to look with suspicion and ridicule upon some of the most characteristic doctrines of Romanism. A story is told by Foxe of a Lincolnshire peasant, busy thrashing his corn in his barn, accosted by a neighbor. 'Good-morrow; you are hard at work.' 'Yes,' replied the man, in allusion to the doctrine of transubstantiation, 'I am thrashing God Almighty out of the straw.' The residence of Erasmus in England, in the beginning of the reign of Henry VIII., stimulated a spirit of biblical inquiry among the educated classes, which, while it remained for the most part faithful to the church of Rome, as in the case of More and others, yet helped to advance a reforming movement. The study of his Greek testament was eagerly entered upon by a few students at both universities, especially at Cambridge. We find Biling, Tyndale, and Frith associated at the latter place in 1520; and in the decade following, Cranmer, Ridley, and Latimer all come into prominent notice.

It is at the end of this latter period—the year 1529—a year before the meeting of the Diet of Augsburg in Germany, that the Reformation in England may be said to take its first decided advance. In this year, the usurpations of the clergy, and the manifold ecclesiastical abuses prevailing in the country, were the subject of parliamentary legislation. The negotiations as to Henry's divorce from Catharine had been proceeding for some time, and the country was greatly excited by the course of events. In 1533, Henry was married to Anne Boleyn, and his former marriage with Catharine declared void. All appeals to Rome were forbidden.

In the two following years, the sovereign was declared to be the supreme head of the church of England, with authority to redress all errors, heresies, and abuses in the church; the monasteries were dissolved; and parliament petitioned that a new translation of the Scriptures might be authorized, and set up in churches. In all this course of reformation, however, there was but little religious impulse on Henry's part, for we find him again, in 1539, yielding violently to the spirit of reaction, and passing the famous statute known as the Six Articles, which rendered it penal to deny the doctrine of transubstantiation, or to affirm that priests might marry. Crammer, who had been for some years Archbishop of Canterbury, labored to prevent their passing; and Latimer resigned his bishopric as soon as they were confirmed.

With the accession of Edward VI., in 1547, the Reformation greatly advanced. The statute of the Six Articles was repealed, with other reactionary measures of the close of Henry's reign. The parliament of 1548 established the use of the Book of Common Prayer; the clergy were permitted to marry; the cup was allowed to the laity; and in 1551, the forty-two articles of religious belief, afterwards reduced to thirty-nine, were promulgated. The temporary restoration of popery under Mary, and the final establishment of Anglican Protestantism under Elizabeth, are well-known events, belonging to the special history of these reigns.

In Scotland, the reforming impulses began with Patrick Hamilton about the same time that Crammer and Latimer first appear active in England. Hamilton was educated in Paris and in Germany, and learned there the doctrines which he introduced into his native country. There was something, indeed, of the same popular movement, known under the name of Lollardism in Scotland, as in England, and Hamilton's preaching may have served to kindle up the dying embers of this movement. His early death, in 1528, undoubtedly produced a great effect. 'Men began,' says Knox, 'very liberally to speak.' 'The reik of Mr. Patrick Hamilton infected as many as it did blow upon.' After Hamilton, George Wishart appears as the next hero-martyr of the Scottish Reformation; and in connection with him—as his reverend disciple and companion—we first hear of John Knox, who became finally the great leading spirit of the movement, by whose influence popery was extirpated, and the Reformation established in Scotland in 1560. The Scottish Reformation followed the type of the Calvinistic Reformation in Geneva, where Knox had taken refuge during the period of persecution in Scotland, and acted for some years as the companion of Calvin. Episcopacy was abolished, and the fabric of the Reformed Kirk set up in every respect as far as possible in opposition to the papal system, which had become the opprobrium of the people.—Ranken's *History of the Reformation in Germany*; D'Aubigné's *History of the Reformation*; Waddington's *History of the Reformation*.

Such is the light in which this great religious revolution presents itself to the Protestant. Catholic students naturally regard it very differently; and although the name REFORMATION has come to be generally adopted as the historical designation of the religious movement of the 16th c., this name is only accepted by Catholics under protest, and as a conventional phrase, the rigorous meaning of which they distinctly repudiate. The more strict writers among Catholics employ in its stead the name 'Pseudo-Reformation,' or 'So-called Reformation.'

As regards the event itself, Roman Catholics, while they admit that many abuses existed in the church which called for reform, and many superstitions existed which deformed the true character of religion among the ignorant masses of the people, contend nevertheless not only that the extent and the nature of these abuses and superstitions are greatly exaggerated, but also that the task of reforming them did not imply either the necessity or the lawfulness of a separation from the church. They assert that the conduct and character of many of those who were most prominently engaged in the movement prove them to have been influenced by corrupt and unworthy motives; that in their effort to throw off the obedience of Rome, they rather sought emancipation from moral and disciplinary restraint, than the purification of the religious system of the church; that the change in many of the countries in which it was effected was brought about mainly through the agency of the sovereign, with a view to the appropriation of the revenues of the church; and that in others it was brought about by appealing to the prejudices of excited and unreasoning multitudes, who were taught to confound the system with its abuses, and who were incapable of distinguishing the true doctrine of the church from the superstitions which were justly held up for reprobation. And thus in the view of Catholics, the true REFORMATION of the church was not that which has been described above, as carried out by the seceders of the 16th c., but that internal change which was effected by the decrees of the Council of Trent, and by the religious revival which took place simultaneously with the sittings of that assembly. They dwell much on the fact, that all the notable successes of Protestantism were at its first origin, and that, in the words of Lord Macaulay,

if Protestantism had at its first onset 'driven Catholicism to the Alps and Pyrenees,' so Catholicism, in its turn, 'rallied and drove back Protestantism even to the German Ocean.'

As to the moral and religious results of the Reformation, the same difference of opinion exists. That the very necessity of action which it created had a beneficial influence on their own church, by the internal revival to which it led, Catholic freely admit; but they look upon the revolt against authority, the inauguration of religious innovation and scepticism, the separation from the church, and the disruption of Christian unity, as fraught with moral and intellectual evil; and a work of much learning has been devoted, by the well-known Catholic theologian, Dr. Döllinger, to establishing this point by the confessions of the first reformers themselves, and their immediate successors. See *Die Reformation, ihre innere Entwicklung und ihre Wirkungen*, von J. Döllinger (3 vols. 8vo, Regensburg, 1848).

REFORMATORY SCHOOLS. The first institution to which Queen Victoria gave her name was a reformatory for girls, established at Chiswick in 1834, under the name of the Victoria Asylum. It was the first of its kind in England; but as early as 1788, the germ of the reformatory movement may be traced in the working of the Philanthropic Society, which established a sort of farm-school, on the family system, for the reformation of depraved and vagrant children. A second school was established in Warwickshire in 1818, but was suffered to die for want of support, as was the third, set on foot by Captain Brenton in 1830. Captain Brenton was the first who took his stand on the principle, that no child under 16 should be sent to prison, but to some place where training might be provided in industry and virtue; and the girls' school at Chiswick originated in his influence, and was worked on his plans. On his death in 1839, reformatory efforts ceased for several years in England—the institution of the Philanthropic Society at St. George's in the Fields being a mere refuge for the destitute. But its chaplain was the Rev. Sydney Turner, since the well-known Inspector of Prisons and Reformatories; and his attention was directed to the reformatory movement abroad, where its principles were flourishing in the School of Mettray (q. v.), founded in 1839, and the Raubes Haus (q. v.), at Hamburg.

In 1847, St. George's Institution restricted its care to boys charged with or convicted of crime; and at length, in 1850, broke up and removed to Redhill, establishing there, on the family system, the greatest Reformatory in England. From this time the progress was rapid and sure. In 1852, several schools were opened: Hardwicke Court by Mr. Baker; Kingswood, by Miss Carpenter; Stoke Farm, by Mr. Joseph Sturge; and Salfrey, near Birmingham, by Mr. Adderley. Government then determined to legalize the system. Three parliamentary committees having pronounced against the imprisonment of children, the Reformatory Schools Act, 17 and 18 Vict., was passed in 1854, followed by amending Acts in the three succeeding years. One of the first principles of the movement was voluntary agency, and this agency was still retained. The Act sets out in its preamble, 'that whereas Reformatory Schools have been, and may be established by voluntary agency in various parts of the country, it is expedient that more extensive use should be made of these institutions.' The state certifies the school to be fit for its purpose, provides that, on conviction, after a short imprisonment, not more, generally, than 14 days, the child shall enter the school, and remain for a term of years, under the sole management of its conductors, paid for by the Treasury—at the fixed rate of 6s. per week. A portion of this is recoverable from the parents, if they are in a condition to contribute to the child's support. Counties and boroughs may furnish from their funds money to aid in the establishment of reformatory schools. The results of the schools have been regularly presented to the public in the Reports of Her Majesty's Inspector, who has often traced to their operation the late marked decline in juvenile delinquency, which was previously rapidly increasing. By the end of 1856, 34 schools were in existence; 11 were added in 1857; and in 1860, the number in Great Britain was 59. At the close of 1880, there were in England 52, and in Scotland 12 reformatories. The number of inmates (including those out on trial) was 6665 in 1875, 6614 in 1876, 6853 in 1877, and 5927 in 1880. The total amount of money expended in the year 1880 on these important institutions was £134,080.

The average cost per head for food and clothing in 1877 was: English boys' schools, food, £8, 1s. 8d.; clothing, £2, 9s. 5d.; English girls' schools, food, £7, 12s. 10d.; clothing, £2, 0s. 8d.; Scotch boys' schools, food, £7, 9s. 2d.; clothing, £2, 9s. 7d.; Scotch girls' schools, food, £6, 12s. 10d.; clothing, £1, 19s. The Education Commission said of these schools: 'Upon the whole, none of the institutions connected with education appear to be in a more satisfactory condition.' It has, however, been urged that children should not be sentenced to reformatories on a first conviction, as it was becoming the rule to do, and that all children under 12 should be sentenced to an Industrial (q. v.) school instead.

REFORMED CHURCHES, a term employed in what may be called a conventional sense, not to designate all the churches of the Reformation, but those in which the Calvinistic doctrines and still more the Calvinistic polity prevail, in contradistinction to the Lutheran (q. v.). The influence of Calvin proved more powerful than that of Zwingle, which, however, no doubt considerably modified the views prevalent in many of these churches. The R. C. are very generally known on the continent of Europe as the *Calvinistic Churches*, whilst the name *Protestant Church* is in some countries almost equivalent to that of *Lutheran*. One chief distinction of all the R. C. is their doctrine of the sacrament of the Lord's Supper, characterized by the utter rejection not only of transubstantiation, but of consubstantiation; and it was on this point, mainly, that the controversy between the Lutherans and the Reformed was long carried on. See **LORD'S SUPPER** and **SACRAMENTARIAN CONTROVERSY**. They are also unanimous in their rejection of the use of images, and of many ceremonies which the Lutherans have thought it proper to retain. Among the R. C. are those both of England and Scotland, notwithstanding the Episcopalian government of the former; the Protestant Church of France, that of the Netherlands, many German churches, the Protestant Churches of Hungary, Poland, &c., with those in America which have sprung from them.

REFORMED PRESBYTERIANS. See **CAMERONIANS**.

REFRACTION. See **DIOPTRICS**; **HEAT**; **REFRACTION, DOUBLE**; **UNDULATORY THEORY**. In the articles referred to, the ordinary experimental laws of single and double refraction are stated; geometrical consequences, such as the mode of action of lenses, prisms, telescopes and microscopes are deduced from them; and the connection of these laws with the hypothesis of undulation is explained.

It remains that we should give the refractive and dispersive powers of a few common substances, to show the great diversity which exists amongst them, especially in the non-proportionality of dispersion to refraction. The following results are due to Fraunhofer, who was the first to employ, for this purpose, Wollaston's discovery of the *fixed lines* in the Spectrum (q. v.), without whose aid all such observations are of comparatively little value. The lines B, D, and H, which we have selected for the table, correspond to definite rays of red, orange, and violet respectively.

Substance.	Refractive Index.			Dispersion (H—B).
	B.	D.	H.	
Flint Glass.....	1·6277	1·6350	1·6710	0·0433
Crown Glass.....	1·5258	1·5296	1·5466	0·0207
Water.....	1·3310	1·3336	1·3442	0·0132
Turpentine.....	1·4705	1·4744	1·4939	0·0234

The numbers in the last column roughly show how far the red and violet are separated by prisms (of a given angle) of the various substances; and even this brief list shows how erroneous was Newton's idea that dispersion is proportional to refraction, an idea which led him to the conclusion that an Achromatic (q. v.) combination was impossible.

Thus we see that the refractive indices of flint and crown-glass are (approximately) as 16 : 15, while the dispersive power of flint is more than double that of crown. Hence, if we construct prisms of the two materials, such that the angular separation of red and violet which they produce shall be equal, the angle of the flint will be far less than that of the crown, and the whole refraction also less. The combination of two such prisms, with their edges turned opposite ways, as in the cut, will thus bend (or refract) a ray of white light without separating the red from the violet—and thus we may obtain *refraction without color*.

This is not strictly the case, on account of what is called *Irrationality of Dispersion*, the existence of which is easily seen from the above table. Thus, if we form two spectra, by means of properly constructed prisms of different media, such that the lines B and H coincide, the lines D will not generally coincide. In other words, some substances draw out the red end of the spectrum more than the violet—and *vice versa*. Thus, from the above table,

	D—B.	H—D.
Flint Glass.....	0·0073	0·0360
Crown Glass.....	0·0038	0·0170

But 73 : 380 : : 38 : 187; hence we see that the distance from B to D in flint bears a less proportion to that from D to H than it does in crown. Thus, if, by proper arrangements, as before mentioned, B and H be made to coincide, D will be nearer the middle of the crown spectrum than of the flint. Hence a double achromatic lens, composed of flint and crown, may be made to refract equally any two colors of the spectrum; but there will be a slight non-accordance of the remaining colors. Three colors may be made coincident by using a *triple* lens, but this is now rarely constructed.

REFRACTION, CONICAL. In certain cases, light, passing as a single ray through a plate of a crystallized body, emerges as a hollow cone of rays; and in others, a single ray, falling on the plate, becomes a cone inside the crystal, and emerges as a hollow cylinder. These extraordinary appearances were *predicted* from theory by Sir W. R. Hamilton (q. v.), and experimentally realized by Lloyd. They form one of the strongest arguments in favor of the truth of the undulatory theory of light. In our article on that subject, we shall briefly describe them in connection with the theory of double refraction in biaxial crystals.

REFRACTION, DOUBLE. The great majority of crystallized bodies: and in general, all transparent bodies (such as glass), when unequally strained, as by pressure, heat, or rapid cooling, divide a single ray which falls on their surface into two. Through a plate of such a substance every object appears doubled. The cause of this singular phenomenon cannot be explained without reference to Polarization (q. v.), and it is therefore deferred to the article on the **UNDULATORY THEORY OF LIGHT**, where the principal experimental facts will be given along with their theoretical explanation.

REFRAIN (Fr-), otherwise called the *burden* of a song, a part of a song which is repeated at the close of every stanza.

REFRIGERANTS. This term is applied in Medicine both to internal and external cooling remedies. The medicines of this class prescribed for internal use cause a refreshing feeling and a sensation of coolness throughout the system, although they do not in reality diminish the temperature of the body. Their principal use is in the treatment of febrile and inflammatory affections in which the benefit they produce appears to depend on the fact, that their direct action on the coats of the stomach occasions by nervous sympathy, a temporary reduction in the force of the circulation. They likewise have the power of allaying gastric irritability and the morbid sensations of heat and thirst. The following are the refrigerants in most common use for internal administration: citric and tartaric acids taken in combination with bicarbonate of potash as effervescing draughts, ripe oranges, lemons (in the form of Lemonade, (q. v.), chlorate of potash (ten grains dissolved in water, and sweetened with syrup, to be taken every second hour), and nitrate of potash, which may be taken in the same manner as the chlorate, or as *nitro-whey*, which is prepared by boiling two drachms of nitre in a pint of new milk; the strained milk may be given in frequent doses of two or three ounces. Many continental physicians regard oxalic acid in the form of lemonade as the best of all the refrigerants. Its poisonous character must not be forgotten, but five grains dissolved in half a pint (or more) of water may be taken, in divided doses, in the twenty-four hours with perfect safety.

The following remarks on the external application of refrigerants are for the most part condensed from Mr. Simon's able article on 'Inflammation' in Holmes's *System of Surgery*. Cold, continuously applied, is the sedative of every vital manifestation; and in theory, it may be regarded as being in direct and essential opposition to the causes of inflammation; and as it is thus an antidote to the causes of inflammation, rather than a remedy for the resulting changes, so, in order to get full advantage from its use, it should be employed from the moment when these causes begin to operate. Cold is of great value in the treatment of wounds, especially such as are made in surgical operations. The local temperature can be thus continuously moderated, care being taken that it is not too much reduced, so as to occasion gangrene. Under the effective use of cold (together, of course, with absolute rest of the parts), many a knee-joint, whether wounded accidentally or by a surgical operation, recovers without permanent injury. In most cases, local cooling is best effected by water of the desired temperature. Cloths wetted with it are spread over the surface which is to be acted on, their original low temperature being retained either by their being continuously dripped upon by means of a bundle of threads inserted in a reservoir of cold water, and acting like a siphon, or by their being frequently rewetted or changed. Their surface should be exposed as freely as possible to the air, so as to secure ample space for evaporation. In cases where great cold is required—as, for example, in cases of strangulated hernia, of inflammation of the brain and its membranes, or of fever with well marked cerebral symptoms—bladders of pounded ice are preferable to wetted cloths. Both as regards the degree of cold and the period of its application, the surgeon should to a considerable degree be influenced by the sensations of his patient. When its application gives comfort, it is almost certain to be doing good; and in most cases where it gives discomfort, it is doing harm.

A notice of the external use of refrigerants would be imperfect without a reference to the memoir of Dr. Esmarch, Professor of Surgery in the University of Kiel, on *the Use of Cold in Surgery*, translated by Dr. Montgomery for 'The New Sydenham Society,' in the year 1861. His mode of application is by means of India-rubber bags filled with ice, snow, or some freezing mixture; or of

thin iron-plate reservoirs of cold water, made by means of a mould of gutta-percha to fit any inflamed part. In a case of 'chronic purulent inflammation of the knee-joint,' the ice-bags were continuously applied for 12 weeks. Dr. James Arnott's investigations on 'Local Anæsthesia by Cold,' in the *Medical Times* for the years 1854-5-7, and Dr. Chapman's method of treating nervous diseases by the application of cold to the spine, as recorded in his *Functional Diseases of Women* and elsewhere, require also a passing reference.

The application of cold, either through the medium of air or water, to the body generally is a subject of great importance. The use of cold air is especially seen in febrile cases, in which the physician directs the sick-room to be kept cool, and the patient (unless in exceptional cases) lightly clothed. Mr. Paget reports that the most successful cases of pyæmia that have fallen under his observation were those in which the patients were freely exposed to the air. The value of baths and cold affusions is noticed in the articles BATH and HYDROPATHY. In addition to what is there stated, it is important to know that prolonged immersion in water as warm as 95° Fahr. may be the means of reducing febrile temperature.

REFRIGERATION OF THE EARTH. That the earth is at present losing heat, is an immediate consequence of the observed fact, that the temperature of its crust *increases* as we descend; for, in any conducting body, the flux of heat is always from warmer to colder parts; and the rate at which heat is thus lost can be easily calculated if we know the conducting power (for heat) of the rocks forming the crust, and the rate at which the temperature increases with the depth under the surface; for the conductivity may be measured by the quantity of heat which, in unit of time, passes (per square foot of surface) through a layer of rock of one foot thickness, whose upper and lower surfaces are maintained at temperatures differing by 1° F. Hence, if k be the conductivity of the crust, and if the temperature increases by 1° F. every x feet of descent, the quantity of heat lost, in unit of time, from each square foot of surface, is measured by $\frac{k}{x}$. k and x

can be determined by experiment for any particular locality, and thus the loss may be determined. These quantities vary very much in value in different localities, thus x is sometimes as great as 110, sometimes as small as 15. The value 50 is generally supposed to give a fair average—that is, for every 50 feet of descent the temperature increases by 1° F. Hence the stifling heat experienced in deep mines. At the depth of a mile, the temperature would on this estimate exceed that of the surface by more than 100° F. Beds of coal at such a depth could not be wrought, as the temperature would far exceed that of tropical climates.

Three methods of accounting for this increase of temperature towards the interior of the earth have been proposed: 1. That the earth was originally molten, either throughout, or for a considerable depth over the whole surface; 2. That the internal heat is due to chemical combination; 3. That the earth, ages ago, passed through a region of space where the temperature was far above that of its present envelope.

Of (1) it is sufficient to say, that such a state is the necessary consequence of impact, if the earth was formed by the aggregation of cosmical masses due to their mutual gravitation. It is scarcely doubted now that this is the origin of solar and stellar heat; and the fact of the moon's turning always the same face to the earth (see ROTATION), is most easily explained on the hypothesis of her original fluidity. The figure of the earth (see EARTH) is also a strong argument in favor of this hypothesis. This explanation of the origin of the earth's internal heat is obviously consistent with the increase of temperature as we descend below the surface—for a spherical mass of molten rock will evidently soon cool externally—while its low conductivity (rendered still lower by the high temperature) will prevent the interior from supplying anything at all equivalent to the loss at the surface. On this hypothesis, the rate of loss of heat must constantly become smaller and smaller, but very slowly; and it is possible that a considerable portion of the earth's mass may still be in a melted state.

The second hypothesis is perfectly sufficient to account for observed facts, but is apparently unnecessary, since (1) has been shown to be, in the universe, a *vera causa*. It is only alluded to here because Lyell and other distinguished geologists have endeavored to show from it that the earth need not be losing heat on the whole, a result perfectly untenable. They suppose the internal heat to be generated by chemical combination, and then that the compounds so formed are again decomposed by electric currents produced by the heat (see THERMO-ELECTRICITY), and are thus prepared to combine again, and reproduce the heat. Were this the case, we should have a Perpetual Motion (q. v.), and, in the present state of science, this is known to be impossible.

The third hypothesis, proposed by Poisson, is easily shown to

be inconsistent with known facts; for, if the passage through the warm region be supposed to have taken place from 1250 to 5000 years ago, the temperature at the earth's surface must have been from 25° to 50° above the present mean temperature, which is inconsistent with history. If it took place 20,000 years ago, the mean temperature must have been 100° F. above its present value. Geology shows that this cannot be accepted. And, if it be supposed to have taken place more than 20,000 years ago, the requisite temperature must have been incompatible with the existence of animal or vegetable life.

From the above argument, which is taken from a paper by Sir William Thomson in the *Transactions of the Royal Society of Edinburgh* (1862), it is obvious that the first hypothesis is that which we must, in the present state of our knowledge, adopt.

Supposing the temperature of melting rock to be from 7000° F. to 10,000° F. (and experiments seem to show that it lies somewhere between these limits), the present state of temperature of the crust indicates that the earth became solid somewhere between 100,000,000 and 200,000,000 years ago. These estimates are based on the known laws of conduction of heat discovered by Fourier, and the conductivity of rocks and soils, deduced by Principal Forbes (q. v.) from observations made in the neighborhood of Edinburgh. But as these observations refer to conductivity at very moderate temperatures only, and as Forbes has shown that conductivity is in general lowered by heating, the lower limit above may possibly be reduced to *twenty million years*.

In conclusion, we may mention, to show how little the internal heat of the earth has to do with surface temperature, that Thomson has shown (*Proc. R. S. E.*, 1868-1864) that if we accept the estimate of 1° F. of increase of temperature for 50 feet of descent, the earth's surface is heated (by conduction of heat from within) only $\frac{1}{47}$ th of a degree Fahrenheit.

REFRIGERATING MACHINES. Under the head ICE, some notice is given of machines by which it can be prepared artificially; but as the practical importance of refrigerating apparatus is daily increasing, we propose to give here a fuller sketch of one or two kinds. The ice-making machine of Carré & Co., of Paris, being one of the simplest and best of those which produce cold by the evaporation of some volatile liquid, we shall describe it first. It is shown in figures 1 and 2, and consists of two strong cast-iron cylinders A and B, connected together by a metal tube T, all perfectly gas-tight. The whole apparatus is made strong enough to stand seven or eight atmospheres of internal pressure.

The cylinder A is charged with an aqueous solution of ammoniacal gas. Ammonia is a powerful absorber of heat, and is, moreover, so extremely soluble in water that the latter takes up nearly seven hundred times its volume of the gas. Air is completely expelled from the apparatus by opening a screw valve and heating the cylinder. It is then ready for use. On applying heat to the cylinder A (fig. 1), which fits into a small stove for the purpose,

Fig. 1.

the solution of ammonia is volatilized, and carried over and condensed in the cylinder B, which is placed in a vessel containing cold water. The heat reaches to about 220° F., and while it is being applied, the volatilized ammonia condenses into a liquid under very high pressure, produced by its own atmosphere, in the cold cylinder B. When the heating is gone on long enough—about half-an-hour for a small machine—the hot cylinder, A, is removed from the fire, and placed in a vessel of cold water, as shown in fig. 2. The cooling of this cylinder immediately causes the reabsorption, by the removal of the pressure, of the condensed ammonia from the other cylinder B; and as it passes again from the liquid to the gaseous state, intense cold is produced (see HEAT), and, in consequence, heat abstracted from everything in contact with this portion of the apparatus.

The cold cylinder B is shown in section in fig. 2. It is so constructed that the ammonia is contained in an outer jacket, leaving a hollow space in the center. When ice is to be made, the latter

is filled with salt water or other liquid which does not freeze at 32° F., and into this is placed a loosely fitting metal cylinder D, containing the water to be frozen. In this way, with a small

Fig. 2

machine for domestic purposes, a few pounds of ice can be made in an hour or two; but large machines, on the same principle, are made which produce 440 lbs. of ice per hour.

There is a well-known refrigerating machine by Mr. D. Siebe of London, in which ether is used as the volatile fluid, its evaporation being produced not by heat, but by the action of an air-pump; the necessary cold is produced in the surrounding brine as the ether passes into vapor.

M. Pictet of Geneva has invented an ice-machine which works with anhydrous sulphurous acid instead of ether; but otherwise his process somewhat resembles Siebe's. It is now at work at an Ice-making Company's works in King's Road, Chelsea. Some

Fig. 3.

machines are also in use which produce ice by means of freezing mixtures; but they are of minor importance.

Mr. A. C. Kirk, late of the Bathgate Chemical Works, undertook, a few years ago, a series of experiments with a view to the construction of such an apparatus which would produce cold by the simple expansion and compression of air. He ultimately succeeded in producing an ingenious machine, which he patented on the 25th April 1862, the number of the specification being 1218.

Although it is not strictly true that the mere rarefaction of air produces cold, yet it will simplify the explanation of this machine to assume in the meantime that it does so. Its simplest

form is shown in fig. 3, and consists of a cylinder with a piston to compress air, communicating with another cylinder containing a kind of piston or plunger where the compressed air is cooled and expanded. The machine is driven by a steam-engine, and it may be as well to remark, that the actual relative position of the cylinders is different from that shown in the diagram, which is given rather to show the principle of the apparatus than as an accurate representation of it.

The compressed air is forced by the compressing cylinder A, into the refrigerating cylinder BB, just at the moment when the position of the plunger, PP, is close upon the upper cone D. This air, which fills the space aa, between the plunger PP, and the lower cone E, is of course heated by the compression; and in order to cool it again, cold water is made to calculate in the cone E, by an entrance-pipe F, and an exit-pipe at G. The next movement of the machine draws the piston in the cylinder A to the opposite end, and consequently allows the compressed air to expand again; but at the same moment the plunger, PP, descends close upon the cone E, thus allowing the space between the plunger and the upper cone D, to be at its fullest when the expansion of the enclosed air is at its greatest.

By this arrangement, the patentees secure that the air while being compressed will always be at the lower, or what he calls the hot end, of the refrigerating cylinder B; and while being expanded, it will always be at the upper or cold end. There is a regenerator constructed as in the Caloric Engine (q. v.) of wire-gauze, placed in the middle of the plunger at C. This, while it allows the air to move freely through it, prevents the conveyance of heat or cold from one end of the cylinder to the other. The plunger, PP, is filled internally with sawdust or some non-conducting material.

We may now explain that the low temperature of the air which surrounds the cone D during expansion, is not produced by simple rarefaction. That alone would not produce cold. It is necessary as well to abstract heat from the air by giving it some work to do, and here it unavoidably does work, in assisting to force back the piston of the compressing cylinder, while in the act of expanding. The air loses an equivalent of heat exactly in proportion to the amount of force which it expends in moving, or in assisting to move, the piston. See FORCE.

Before air is admitted into the cylinder, it is necessary to dry it thoroughly, by first passing it through a box containing chloride of calcium, because, if any moisture were present, it would freeze in the regenerator, and stop the action of the machine. In the particular form of the apparatus shown in the figure, the substance to be cooled is placed inside the cone D, which is furnished with a lid L. Here not only water, but even mercury, can be frozen with facility.

Most of the machines of this kind which have as yet been made were required for working on a more extensive scale than the one shown in fig. 3 could easily do. In the larger-sized machines, accordingly, instead of one hollow cone like D (fig. 3), a series of circular V-shaped corrugations are fixed to the top cover of the refrigerating cylinder. These form annular passages, through which a continuous current of some fluid not easily frozen, such as brine, flows. This is of course cooled by the expanded air (in the manner already explained) at the cold end of the cylinder, and can be conveyed away in pipes. The most serious objection to this method was its comparative cost.

The increasing imports of dead meat from America gave a new impulse to the improvement of refrigerating processes. The meat chambers were at first cooled by means of currents of air forced over and between ice-blocks. This method kept the air perpetually moist, and produced somewhat deleterious effects on the meat. The Messrs. Bell of Glasgow secured the assistance of Mr. J. J. Coleman, who perfected a purely mechanical refrigerator known as the Bell-Coleman machine. This apparatus has a good deal in common with Kirk's. The air is taken from the meat chamber and greatly compressed, being played upon the while by small jets of water, in order to abstract the heat developed during pressure. It next circulates through a series of tubes where it is further cooled, and deposits great part of its moisture. The next stage is the expansion process; and by being constrained during expansion to perform a certain amount of mechanical work in turning cranks, it further loses heat. It is now found to be a powerful refrigerating agent. Machines on the Bell-Coleman principle have been fitted up in many lines of ocean steamers, and have rendered possible the transmission from America, Australia, and New Zealand, enormous quantities of beef and mutton in perfect condition. It is also used for stationary refrigerators in hot countries. For the Haslam machine it is claimed that the air from it is drier than from that of Mr. Coleman.

The ether-machine of Siddeley & Mackay of Liverpool, which is an improvement on Siebe's, is now a good deal used for making ice, and for other purposes. In it a steam-engine is employed to work two vacuum-pumps, and to supply motive-power to other parts of the apparatus. The refrigerating vessels contain thin

pipes, through which brine or chloride of calcium flows. Ether surrounds these pipes; and under the reduced pressure produced by the vacuum-pumps, with which the refrigerators communicate, a portion of the ether evaporates, producing cold in the act of doing so, as already explained. The ether vapor is then condensed at a slight pressure, cooled by a stream of cold water, and returned to the refrigerator. Reece's ammonia machine is more recent than Carré's, and is worked with anhydrous ammonia, instead of an aqueous solution of it. In Reece's process, less fuel is required to distil the ammonia, less water to condense it, and less power to work the moving parts of the machine.

It is only within the last twenty years that much attention has been given to the construction of machines for the production of artificial cold on the large scale; but they have already received several important applications. In this country, besides being available for the production of ice; the extraction of certain salts from mixed solutions, such as sulphate of soda from common salt—the former separating at a temperature above that which keeps the latter in solution; the separation of paraffin from mineral oils; and in other chemical operations, as well as for cooling worts in breweries and distilleries, they are now turned to good account in bringing fresh meat from distant countries to our shores. In warm countries, besides other uses, they could be applied to cool large hospitals and public buildings, by sending a current of some cold liquid through pipes, just as we in Great Britain heat buildings with pipes through which hot water flows.

REFUGEE' (Fr. *refugé*), a name given to persons who have fled from religious or political persecution in their own country, and taken refuge in another. The term was first applied to those Protestants who found an asylum in Britain and elsewhere at two different periods, first during the Flemish persecutions under the Duke of Alva in 1567, and afterwards in 1685, when Louis XIV. of France revoked the Edict of Nantes. Of the numerous French artisans who settled in England on this last occasion, the most part Anglicized their names, as by substituting Young for 'Le Jeune,' Taylor for 'Tellier,' &c., so that their posterity can now hardly be recognized as of foreign origin. According to Lower (*Patronymica Britannica*) De Preux became Deprose, and 'Richard Despair, a poor man,' buried at East Grimstead, was, in the orthography of his forefathers, Despard. There were also refugee families of a higher class, some of whose descendants and representatives came to occupy a place in the peerage. The Bouveries, Earls of Radnor, are descended from a French refugee family. The refugee family of Blaquiére was raised to the Irish peerage; and Charles Shaw Lefevre, Lord Eversley, is the representative of a family of Irish refugees. The military employment offered in Ireland after 1688 maintained a considerable number of foreign Protestants.

General Frederic Armand de Schomberg, was raised by William III. to the peerage, becoming eventually Duke of Schomberg. A Huguenot officer of hardly less celebrity was Henry Massue Marquis de Ruigny, created by William III. Earl of Galway. Lord Ligonier was also of a noble Huguenot family, and England has had at least one refugee bishop in Dr. Majendie, Bishop of Chester, and afterwards of Bangor. Among other refugees of note may be enumerated Sir John Houbion, Lord Mayor of London in 1695, one branch of whose family is now represented by Lord Palmerston; Elias Bouherau or Boireau, D.D., whose descendant was created a baronet as Sir Richard Borough of Baselden Park, Berkshire; as well as Martineaus, Bosanquets, and Papillons, whose descendants have attained more or less eminence in the country of their adoption. The first French Revolution brought numerous political refugees to England, and Great Britain is noted throughout Europe for affording a ready asylum to refugees of all classes, both political and religious. Weiss' *History of the French Protestant Refugees, from the Revocation of the Edict of Nantes to the Present Time*, translated by Hardman (London, 1854); J. S. Burn's *History of the French, Walloon, Dutch, and other Foreign Protestant Refugees settled in England from the Reign of Henry VIII. to the Revocation of the Edict of Nantes*.

REGALBUTO, or **RAGALBUTO**, a city in the island of Sicily, in the province of Catania, and 30 miles west-north-west of the city of that name. It is beautifully situated on a hill near the right bank of the river Salso, and with Mount Etna bounding the prospect on the north-east. Its only object of interest is the cathedral. Pop. 9000.

REGA' LIA, the ensigns of royalty, including more particularly the apparatus of a coronation. The regalia of England were, prior to the Reformation, in the keeping of the monks of Westminster Abbey, and they are still presented to the sovereign at the coronation by the dean and prebendaries of that church. During the Civil War, the crown and most of the regalia fell victims to Puritan zeal; and on the restoration of the royal family, new ensigns had to be made for the coronation of Charles II., which with occasional alterations and repairs, have continued in

use down to the present day. The regalia, strictly so called, consist of the crown, the sceptre with the cross, the verge or rod with the dove, the so-called staff of Edward the Confessor (made in reality for Charles II.), the blunt sword of mercy called Curtana, the two sharp swords of justice, spiritual and temporal, the ampulla or receptacle for the coronation oil, the anointing spoon (probably the only existing relic of the old regalia), the armillæ or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the Jewel-room in the Tower of London, in which are also a smaller crown, sceptre, and orb for the coronation of a queen-consort, two other queen-consorts' sceptres—one of ivory, made by Marie d'Este; and the state-crown of silver and diamonds, which was used at the coronation of Queen Victoria, containing a large ruby and sapphire, the former said to have been worn by Edward the Black Prince. The Prince of Wales's crown of gold, without stones, is modern.

The proper regalia of Scotland consist of the crown, the sceptre, and the sword of state. The crown probably belongs to the time of Robert Bruce, and is adorned with crosses and fleurs de lis alternately. It was originally an open crown, but two concentric arches were added in the reign of James V., surmounted at the point of intersection by a mound of gold and a large cross patée. The sceptre is of the time of James V.; the sword was a present from Pope Julius II. to James IV. in 1507. During the Civil War, the regalia were removed by the Earl Marischal for safe custody from the Crown-room of Edinburgh Castle, their usual place of deposit, to his castle of Dunnottar; and while Dunnottar was besieged by the Parliamentary army, the regalia were preserved by being conveyed by stratagem to the manse of Kinneff, by the wife of Ogilvy of Barras, the lieutenant-governor, and the wife of the minister of Kinneff. From the Restoration to the Union, the regalia continued to be kept in the Crown-room as formerly; at the beginning of each session, they were delivered to the Earl Marischal or his deputy, in whose custody they remained while parliament was sitting, and were afterwards restored to the charge of the Treasurer. William, ninth Earl Marischal, who opposed the Treaty of Union in all its stages, declined to witness its consummation, but appeared by his deputy, who took a written protest that the regalia should not be removed from the castle of Edinburgh without warning given to him or his successor in office. From that time till 1818, the regalia remained locked in a chest in the Crown-room, away from public gaze, and it came to be the general belief that they had been secretly conveyed away to London, an idea confirmed by the keeper of the Jewel-office in the Tower showing a crown which was alleged to be that of Scotland.

On the 4th February 1818, an order being obtained by warrant under the sign-manual of George IV., then Prince-regent, the chest in the Crown-room was broken open, and the crown, sword, and sceptre were found as they had been deposited at the Union, along with a silver rod of office, supposed to be that of the Lord High Treasurer. They are now in the charge of the officers of state for Scotland, as commissioners for the custody of the regalia, and are exhibited in the Crown-room, along with a ruby ring, set with diamonds, worn by Charles I. at his coronation at Holyrood in 1633; the golden collar of the Garter, sent by Elizabeth to James VI.; the St. George and Dragon, or badge of the Order of the Garter; and the badge of the Order of the Thistle, with figures of St. Andrew and Anne of Denmark, set in diamonds. These latter insignia were bequeathed by Cardinal York, the last of the Stuarts, to George IV., and sent to Edinburgh Castle in 1880, by order of William IV.

REGALIA, or **REGALE**, **RIGHT OF**, a right in ecclesiastical things, claimed by sovereigns in virtue of the royal prerogative, which has frequently been the subject of controversy between kings and popes. It involved several points as to presentation to benefices, most of which formed the object from time to time of negotiation by concordat; but the most serious conflict arose out of the claim made by the crown to the revenues of vacant benefices, especially bishoprics, and the co-ordinate claim to keep the benefice or the sea vacant for an indefinite period, in order to appropriate its revenue. This plainly abusive claim was one of the main grounds of complaint on the part of the popes as to the practice of lay **INVESTITURES** (q. v.), and it reached its height in England under the first Norman kings, especially William Rufus. The most memorable conflict, however, on the subject of the regalia was that of Innocent XI. (q. v.) with Louis XIV., which was maintained with great pertinacity on both sides for several years, the king extending the claim to some of the French provinces which had until then been exempt from it, and the pope refusing to confirm any of the appointments of Louis to the sees which became vacant, as long as the obnoxious claim should be persisted in. The dispute continued till after the death of Innocent, Louis XIV. having gone so far as to seize upon the papal territory of Avignon in reprisal; but it was adjusted in the fol-

lowing pontificate, the most obnoxious part of the claim being practically abandoned, although not formally withdrawn.

REGA'LITY, a species of territorial jurisdiction formerly existing in Scotland, nearly akin to a Palatinate (q. v.) in England. The lands were given over by the sovereign *liberam regalitatem* to some powerful noble, called a *Lord of Regality*, to control as he best might with the strong hand. The lord of regality exercised the highest prerogatives of the crown, including originally the four pleas, often having a complete court of his own, with seneschal, chancellor, chamberlain, and other officials, in imitation of royalty. An offender amenable to a court of regality might have been reprieved from the sheriff, or even from the Court of Justiciary. Jurisdictions of regality were abolished by act 20 Geo. II. c. 50.

RE'GALS (perhaps from *rigabello*, an instrument used prior to the organ in the churches of Italy), a small portable finger-organ in use in the 16th and 17th centuries, and perhaps earlier. Many representations exist of this instrument, including one sculptured on Melrose Abbey. The tubes rested on the air-chest, which was filled by the bellows; and the bellows were managed with one hand, and the keys with the other. Until 80 years ago, there existed in the royal household an officer called the *Tuner of Regals*.

REGA'RDANT, a term used in heraldry with reference to an animal whose head is turned backwards. See **PASSANT** and **RAMPANT**.

REGA'TTA. This word originated in the Venetian dialect, and signified a boat-race, held annually with great solemnity among the gondoliers. Thence the expression has extended its meaning, and is now applied to all rowing or sailing matches indiscriminately, and especially to the contests between yachts.

REGLA'TION. This is an exceedingly ill-chosen term for a somewhat obscure phenomenon, inasmuch as it implies a previous state which may not have existed. Unfortunately, the term has come into general use, and we must make the best of it. The principal fact to be explained is the adhesion of two pieces of ice brought into contact, not merely in air, but even when both are immersed in water at such temperatures as 100° F. Several explanations have been proposed, of which we may specially mention those of Faraday, Forbes, and J. Thomson.

Faraday's idea seemed to be, that in liquid and solid bodies the proximity of particles in a particular state tends to produce the same state in other particles; and thus, that a film of water between two plates of ice tends to assume the solid state. There are many singular phenomena in physical science, which are apparently explicable by this suggestion; but with all due deference to so great an authority, the so-called explanation seems merely to *shift* the difficulty, without in any way overcoming it.

Forbes starts with the assumption, that ice is essentially colder than water, and therefore that there is constantly a transfer of heat from water to ice which is in contact with it; the effect being to cover the surface of the ice with a film of half-melted ice or half-frozen water. Such a film, existing between two slabs of ice, would part with heat to both, and would freeze without melting the adjacent ice. This explanation would be satisfactory if the postulate could be granted, but it seems very improbable that there is any such essential difference of temperature between solid and liquid water.

The explanation proposed by Professor J. Thomson is undoubtedly founded on a *vera causa*, but there may be some hesitation in allowing that the cause is adequate to the production of the observed effect in every case. It is certain, however, that it accounts for at least part of the phenomenon. It is founded on his very beautiful theoretical discovery that *the freezing-point of water is lowered by pressure*, which was experimentally verified by W. Thomson. Hence, if two slabs of ice be pressed together, at the points of greatest pressure the ice will be melted; its latent heat of fusion must be drawn from surrounding bodies, and thus cold is produced which will freeze part of the film of water between the two slabs. The points of greatest pressure will thus be shifted, and the process of melting and regelation may go on indefinitely. Objections to this explanation were advanced by Faraday and Forbes, who showed that slabs of ice freeze together when suspended vertically with the view of avoiding pressure between them. But J. Thomson shows that the capillary forces of the film of water which must (in these cases) be between the slabs (for without directly applied pressure the effect cannot be obtained with slabs of *dry* ice), are sufficient to produce the pressure requisite for the application of his mode of explanation.

This part of the subject cannot be said to be completely cleared up; but the theory of J. Thomson has been applied with perfect success to the explanation of the very extraordinary phenomena observed in Glaciers (q. v.), where enormous forces are constantly at work. It evidently at once accounts for the result of observation, due to Rendu and Forbes, that a glacier moves like a viscous fluid; in fact, it shows why and how the

mass gives way to pressure, and how it is re-frozen in a new form, which in turn gives way to the new distribution of pressure. The explanation of the veined structure, the formation of clear ice from snow, &c., are all easily deduced from it.

The phenomena of regelation are easily seen in the making of snow-balls, which is well known to be impossible, by the hands at least, when the snow has been exposed to great cold, and is therefore dry. But, even in this case, the effect is easily obtained by the application of pressure sufficient to melt the ice, as is well seen in wheel-tracks, &c. By means of a Bramah's press, it is easy to convert a snowball into a sphere of perfectly clear ice.

REGENERATION is a theological expression denoting the spiritual change which passes on all men in becoming Christians. There are various interpretations of the mode and meaning of this change, but its necessity in some shape or another may be said to be admitted by all branches of the Christian Church. By all, man is supposed, as the condition of his becoming truly Christian, to pass from a state of nature to a state of regeneration, from a state in which he obeys the mere impulses of the natural life to a state in which a new and higher—a divine—life has been awakened in him. The words of our Lord to Nicodemus: 'Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God,' are accepted as the expression of this universal necessity by the Christian Church. It may be further stated that every branch of the Catholic Church recognizes, although under very different conditions, the Holy Spirit as the author of this change. The change, in its real character, is spiritual, and spiritually induced. According to certain sections of the Christian Church, however, the change is inseparably involved with Christian baptism in all cases; while other sections do not acknowledge any essential connection between baptism and regeneration. In the view of the former, baptism constitutes always a real point of transition from the natural to the spiritual life. The grace of baptism is the grace of regeneration; the laver of baptism is the laver of regeneration, not merely in any formal sense, but in a real and living sense, so that every baptized person—or at least every rightly baptized person—has already become a Christian truly, although he may fall away from the grace that he has received. This is what is commonly called the High Church doctrine of regeneration.

In the view of others, regeneration is a special, conscious process, which takes place independently of baptism, or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life; and many Christians have spoken with rapture of this *experience*, of its thoroughness, its suddenness, its immediateness. There are different shades of opinion on the subject, some holding it as a condition of regeneration, that the regenerate should be able to recount, or at least give some precise idea of the time and manner of the change through which they have passed; others repudiating such views as savoring of fanaticism, yet holding no less to the spiritual definiteness of the change, independently of church forms of any kind; and such views, in contradistinction to the High Church doctrine, have received the name of Evangelical. The idea that regeneration is essentially involved in baptism, or identical with baptism, is supposed by many Christians to be a peculiarly unevangelical idea.

REGENERATOR FURNACE. See **GLASS**, Vol. IV., pp. 777-8.

RE'GENSBURG, or **RATISBON** (Lat. *Reginum, Radespona*), the capital of a Bavarian province, stands on the right bank of the Danube, 65 miles N.E. of Munich. Pop. (1880) 34,516. R. formerly a free city of the empire and seat of the Diet, is situated in the midst of a broad and fruitful valley, lying 1000 feet above the level of the sea. It presents a strongly-marked mediæval character, with its ancient ramparts, fosses, and gates, and its narrow crooked streets, with their high, many-cornered, gabled houses, while it retains many interesting monuments of its importance and wealth during the middle ages. Among its 13 Roman Catholic churches, the most remarkable is the cathedral, begun in 1275, and not completed till the middle of the 17th c., which ranks, since its restoration in 1830-1838, as one of the noblest specimens of German architecture, and is especially noteworthy for the fine monuments of its former bishops, and for its silver altar and numerous painted-glass windows, restored in 1830.

The Scottish Church of St. James (secularized in 1862) dates from the 12th c., and is built in the pure Byzantine style. There are several monasteries in R., and three Protestant churches. The old town-hall was used for a century and a half as the place of meeting for the imperial diet. The royal library contains 60,000 volumes. The city has several highly ornamental fountains, and contains a monument to Kepler, the astronomer, who died in R. A stone bridge connects R. with the busy trading suburb of Stadt and Hof. The manufactures of R. include gold, silver,

brass, and steel wares, paper, earthenware, beet-root sugar, brandy, and candles and soap of superior quality. Since 1853, it has been a free port; and in addition to ship-building, which is carried on with much activity, the trading community is extensively engaged in the transport of corn, wood, and salt. R., as the principal seat of the Danube Steam-navigation Company, is an especially busy trading port.

R., which ranks as one of the most ancient cities of Germany, and was built by the Romans, by whom it was named *Reginum*, was a place of considerable commercial importance in the early ages of Christianity. In the year 750, a bishopric was founded here, which embraced a large portion of Bavaria and the Upper Palatinate. Under the Emperor Frederick I., it was relieved from the subjection under which it had previously stood to the dukes of Bavaria, and declared a free city. During the middle ages, it was the chief seat of the Indo-Levantine trade, and was one of the wealthiest and most populous cities of Southern Germany. From 1663 to the dissolution of the German empire in 1806, R. was, with a very short interregnum, the seat of the German Diet; and after undergoing various changes of fortune during the period of Napoleon's power, was finally ceded to Bavaria, of which it has since formed an integral part.

RE'GENT (Lat. *rego*, I govern), one who exercises the power without having the name of a king. In a hereditary monarchy, there are various circumstances which may necessitate the delegation of the sovereign power—as the devolution of the crown on a minor too young to be trusted with the kingly office; the incapacity of the sovereign by illness, mental or bodily; and the case of absence from the realm. A regent under the title of Protector (q. v.) has often been appointed to exercise royal authority in the sovereign's minority, the latest instance in England being during the minority of Edward VI.; and regents and councils of regency have been sometimes named by the sovereign to provide for the probable nonage of his heir. According to Coke, the surest way of making such an appointment is by authority of the Great Council in parliament; and in recent times the appointment has generally been made by statute. During the frequent absences of the first two kings of the House of Hanover in their continental dominions, it was the practice to appoint regents or *Lords Justices* (q. v.) to exercise the powers of sovereign. In 1788, when George III. became incapacitated from exercising the kingly office by insanity, it became a question whether his eldest son, then of full age, had a right to be regent, or whether the nomination rested with parliament. The chief political authorities of the time were divided in their judgment, but the king's recovery ended the discussion. On the return of the malady, all parties were unanimous that the regency should be conferred on the Prince of Wales; this was done, however, by parliament, and for the first year of his regency, certain restrictions were imposed, which were to be removed in the case—which eventually occurred—of the king's continued illness.

In 1830, a Regency Bill was passed, providing for the administration of the government, should the crown descend to the Princess Victoria before she attained eighteen years of age; and in 1840, a Regency Bill (3 and 4 Vict. c. 52), was passed, providing that the late Prince Consort should be regent, in the event of the demise of the Queen, her next lineal successor being under age. During her present Majesty's various short absences from the country, there has been no delegation of the royal power.

REGENT OF A UNIVERSITY. In the university of Paris, where this as well as other learned distinctions originated, every Master of Arts possessed the privilege, which he was bound to exercise, of delivering public lectures. The same was the case at first in the universities of Oxford and Cambridge. In process of time, however—about the middle of the 13th c.—the title of Master became a degree attainable by any one after a certain amount of residence, and a certain proficiency, and the duty of lecturing was confined to a limited number of graduates, called *Regents*. The regents were eventually succeeded in the office of lecturing by the established professors. In the English universities, a Master of Arts becomes a regent after a short period, and is supposed to read lectures during the year of his regency. The regents still form the governing body in the Convocation and Congregation at Oxford, and in the Senate of Cambridge. In the Scottish universities, according to their early constitution, the regents were the lecturers; and celibacy was enforced on them down to about the middle of the 17th century.

REGGE'LO, a small town of Italy, in the province of Florence, and 16 miles east-south-east of the city of that name. It is surrounded by beautiful hills, which produce wines, fruits, and grain in abundance. Pop. 10,200.

RE'GGIO (anciently *Rhegium Julii*), a seaport in the south of Italy, the chief city of the province of Reggio (formerly Calabria Ultra I.), stands on the shore of the Strait of Messina, ten miles S.-E. of the city of Messina in Sicily. Pop. (1871) of town and suburbs, 29,854; of commune, 25,235. It is well built; its streets

are wide and regular, and it is surrounded by a wall flanked by towers. A fine cathedral, a hospital, and several educational institutions are the principal buildings. Manufactures of linens, stockings, silks, and odoriferous waters, are carried on. The fisheries of the vicinity are profitable, and abound in the Pinna (q. v.), a mollusc, the very delicate skin of which is made into gloves, stockings, and caps of great value. The climate of R. is salubrious, and the scenery of the vicinity exceedingly beautiful; the soil is rich, and produces fruit-bearing plants, both of the temperate and tropical zones, in great variety. Behind the city rises Aspromonte, a mountain of the Apennines, where Garibaldi was wounded and taken prisoner in 1862.

The ancient *Rhegium* was founded by the Greeks, was governed wisely and justly by Anaxilas, and afterwards by his sons, 494—461 B.C. It was besieged and destroyed by Dionysius the Elder, rebuilt by Dionysius the Younger and afterwards united to Rome.

REGGIO, a city of Central Italy, formerly belonging to the duchy of Modena, and now included in the province of that name, stands on the ancient *Via Emilia*, 16 miles west-north-west of the city of Modena. R. is situated on a fertile plain on the right bank of the Crostolo; is surrounded by a wall; contains beautiful palaces, and a fine cathedral of the 15th c. and other churches, which possess famous paintings; the *Teatro Nuovo*, one of the finest theaters in Italy; the Innatic asylum; a museum, an academy, and many other institutions. It is a rich city, and has manufactures of cotton, of cloth, and of other stuffs. Population of the town proper, about 20,000.

RE'GIA MAJESTA'TEM is the title given to an ancient collection of laws bearing to have been compiled by order of David I., king of Scotland. The authenticity of the work has been controverted, the prevalent opinion being that it is a compilation from the English work of Glanville, called the *Regiam Potestatem*, and that the publication of the book was an artifice of Edward I. to further his design of assimilating the Scotch law to that of England.

REGI'LLUS, LAKE, anciently a small lake of Latium, to the south-east of Rome, probably in the extinct volcanic crater of Cornufelle, near the modern Frascati, which was drained in the 17th c. Lake R. is celebrated in the semi-legendary history of Rome as the scene (496 B.C.) of a great battle between the Romans, under Aulus Postumius, and the Latins, on behalf of the banished Tarquin, under O. Mamilius. The latter were entirely defeated.

RE'GIMENT, in all modern armies, is a colonel's command, and the largest permanent association of soldiers. Regiments may be combined into brigades, brigades into divisions, and divisions into armies; but these combinations are but temporary, while in the regiment the same officers serve continually, and in command of the same body of men. The strength of a regiment may vary greatly even in the same army, as each may comprise any number of battalions. In 1881 the numerical designations of the British foot regiments were dropped, the regiments reorganized as territorial regiments in 102 regimental districts, and other changes made. Most of the regiments have now 4 battalions, of which the first two are regulars, and 3d and 4th militia. Some have 5 battalions; and two rifle brigades have 9 battalions each. (For the correspondence of the old and new systems, see *Army List*, or any of the almanacs that quote it.) The whole artillery force is comprised in one regiment. The strength of a regiment is changed from time to time; usually by the addition or withdrawal of private soldiers. The present plan would be, in case of war, to raise the skeleton regiment to war strength by calling in men from the Army Reserve.

The regimental system could only exist where standing armies are maintained. Accordingly, the Macedonian syntagmata and the Roman cohorts were evidently regiments in a strict sense. During the middle ages, feudal organization precluded the system, and its first reappearance was in France. Francis I. formed legions of 6000 men each, which were divided into independent companies, the latter being, in fact, battalions, and each legion a regiment. The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland, 1598. From that time forward, the army and militia of Britain have been organized into regiments.

Charles I. and the parliament each raised regiments, all of which were disbanded at the Restoration, with the exception of the Lord-General's Regiment of Foot, and his Life Guard of Horse. These two were re-engaged (1661), and form the present Coldstream Guards and Royal Horse Guards. In the same year, a Scotch Corps of 1700 men, which had taken service in France in the time of James I., returned to England, and was included in the British army as the 1st Foot. In 1693 was raised the 1st troop of Horse Grenadier Guards, and the 2d troop in 1702. These were re-formed in 1782 as the 1st and 2d Life Guards.

Besides cavalry and infantry, the British army comprises the regiment of artillery, and the corps of Royal Engineers, and military train.

The 110 regiments of the line have recently been re-organized as 71 regiments of linked battalions (see *WAR SERVICES*). The old arrangement was as under.

	Regiments.	Officers and Men.
Life Guards.....	2	868
Horse Guards (Blues).....	1	484
Cavalry of the Line—		
Dragoon Guards.....	7	28 15,973
Dragoons.....	3	
Hussars.....	13	
Lancers.....	5	
Horse Artillery.....	1	5,633 in 6 brigades.
Foot Artillery.....	1	29,291 in 26 brigades.
Royal Engineers.....	1	5,710
Foot Guards.....	3	5,950 in 7 battalions.
Infantry of the Line.....	110	119,483 in 141 battalions.
Army Hospital Corps.....	1	1,574
Army Service Corps.....	1	3,014
West India Regiments (black troops).....	2	1,832 in 2 battalions.
Colonial Corps.....	1	649 in 1 battalion.
Total.....	151	190,411

Each regiment is nominally commanded by a colonel, who is an old general officer, and whose office is merely a sinecure. The real command rests with the lieutenant-colonel in each battalion, who is assisted by a major, and has for a staff an adjutant, a quartermaster, a paymaster, and a surgeon. The regiment or battalion is divided into companies in infantry, engineers, and Army Service Corps; into troops in the cavalry. The artillery is divided into 30 brigades, each of which is as large as an ordinary regiment. The brigade is subdivided into batteries, which are the working units. The working officers are captain and 2 lieutenants to each infantry company or cavalry troop; major, captain, three lieutenants per battery of artillery.

The following table shows the allotment of the several ranks in each arm at home :

	Infantry Battalion of 8 Companies.	Cavalry Regiment of 8 Troops.	Field-Artillery Battalion of 7 Batteries.
Officers—			
Staff.....	5	7	11
Companies, Troops, or Batteries.....	21	21	35
Non-commissioned Officers—			
Staff.....	10	11	6
Companies, &c.....	48	48	77
Rank and File—			
Corporals, &c.....	40	32	70
Privates.....	480	415	934
Total.....	604	534	1133

By the scheme of army organization carried out between 1867 and 1876, each of the ten military districts, into which the three kingdoms are divided, falls again into 66 *infantry* brigade or sub-districts, 2 cavalry and 12 artillery sub-districts. The infantry brigade consists of 2 line battalions, the brigade dépôt, 2 militia battalions with reserves and volunteers. The additional reforms of 1881 proposed that the territorial brigade should be consolidated as a 'territorial regiment' with a county dépôt. See *UNIFORM*.

REGIMENTAL SCHOOLS are maintained by the state in every regiment. There is a schoolmaster for the soldiers and elder boys; and a trained schoolmistress—usually the schoolmaster's wife—to teach the girls and infants of both sexes. Attendance at the schools is optional. Religious instruction takes place on Monday mornings, when children can be kept from school. The girls' school comprises an 'industrial' section for needlework, &c. The charge for the year 1880—1881 was £40,109.

REGIOMONTANUS, the name adopted by an early German mathematician, called Johann Müller, probably because he was a native of Königsberg (of which *Regiomontanus* seems intended as a Latin equivalent), where he was born 6th June 1436. Which Königsberg, however, is to be understood, is a disputed point among his biographers, but Delambre and others favor the one in Franconia. R. was sent by his parents to Leipzig at the age of 12, and there made such rapid and extraordinary progress in mathematical studies, that by the time he was 16, he could find nobody, it is said, in the Saxon University competent to give him further instructions. He therefore removed to Vienna, where, in

1461, he became professor of astronomy, but was permitted to reside in Italy for some time, in order to study Greek, with the view of making himself acquainted with the writings of the Alexandrian geometers and astronomers. He appears while here to have gone through a great amount of laborious work in the collection, collation, and copying of Greek MSS., in studying the language (under the best masters, such as Theodore Gaza), making astronomical observations, lecturing to the students of Padua on the Arabian philosopher Alfragan, and composing his celebrated work, *De Triangulis Planis et Sphaericis* (first published at Nürnberg, 57 years after his death), which, according to Delambre, gives a very complete account of what was then known of plane and spherical trigonometry.

In 1464, R. returned to Vienna, where he remained for some years in the discharge of his duties as professor; but afterwards removed to Buda, in Hungary, on the invitation of Mathias Corvinus. In 1471, he went to Nürnberg, where he lived in close intimacy with a wealthy and enlightened citizen, named Bernard Walther, who furnished him, among other things, with means to start a book-printing establishment, and to construct various astronomical instruments, by which they were enabled to demonstrate the inaccuracies of the 'Alphonsine Tables.' Their united labors are to be found in the *Observationes 30 Annorum à J. Regiomontano et B. Walthero* (Nürnberg, 1544). R. now devoted himself vigorously to the composition of scientific works, among others, his *Kalendarium Novum* (ante 1475), which is thought to have been the first almanac that ever appeared in Europe. This last work excited great attention among the learned and powerful of the time, and the first edition was rapidly sold off. The king of Hungary presented R. with a gift of 800 or 1200 golden crowns. Pope Sixtus IV. now sought his assistance in his meditated reformation of the calendar, and to secure his services, conferred on him the dignity of Archbishop of Ratisbon. He now left Nürnberg, and proceeded again to Rome, where, however, he died, 6th July 1476, at the early age of 41. R.'s premature death was a serious loss to the science of mathematics. He is pronounced by competent authorities the most learned astronomer of his age; and his sagacity and ardor were such as to promise important acquisitions to our knowledge of celestial physics. A list of his numerous writings is given by Delambre in the *Biographie Universelle*.

REGISTER, LORD, or LORD CLERK REGISTER, a Scottish officer of state who has the custody of the national archives. He was in former times the principal clerk of the kingdom, from whom all other clerks derived their authority. The office used to be held at pleasure, but since 1777 has been conferred for life. The Lord R. is assisted in his duties by a resident deputy.

REGISTER OF ORGAN, a name sometimes given to the sets of pipes or stops of an organ. See *ORGAN*.

REGISTERS OF VOICE, a term applied to the different kinds of sound distinguishable in the graduated scale of notes produced by any individual voice. Those sounds which, like the ordinary sounds of speech, proceed naturally and freely from the voice, constitute what is called the *chest voice*. By means of a strained contraction of the glottis, notes may be produced of a higher pitch than those of the chest voice; these are called *falsetto* or *head voice*, and have a peculiar flute or flageolet-like quality of their own. Though often sweet and exceedingly pleasing, they cannot be used for a length of time without some amount of constraint or effort, and they are never so powerful, so open, or so impressive as the chest voice. The lower notes, and, in most voices, by far the greater number of notes, belong to the chest voice, the falsetto being only employed in the higher and highest sounds. The sounds produced by the head voice are called the *upper register*, those produced by the chest voice the *lower register*, of the voice; and such notes of the chest voice as may also be produced by the falsetto are said to belong to the *middle register*. In a properly trained voice, the falsetto is so blended with the chest voice that there is no perceptible break between them.

REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES is an improvement introduced in modern times, and ingrafted on the law and social custom of the United Kingdom for the purpose of keeping an exact account of important facts connected with the population of the country and its social progress. In England, the first act for this purpose was passed in 1836, and a general registry-office was provided in London (at Somerset House) for England and Wales. But even before the new arrangement, there had been long in operation an ecclesiastical mode of registration of marriages, baptisms, and burials in connection with each parish church, the officiating minister being required to keep such a register. By that act, which still retains its force as to baptisms and burials, registers of public and private baptisms, and burials solemnized according to the rites of the Established Church in any parish or chapel, are to be kept, and entries made, by the minister within seven days at least after the ceremony. These registers are to be transmitted annually to the registrar of the diocese, who keeps the same, and allows in-

spection on payment of certain fees—severe penalties being incurred by any one who forges or injures the register. This mode of registration was found to be insufficient for statistical purposes, for it was confined only to births and deaths, so far as the ceremonies of the church extended; and hence a systematic plan was instituted in 1836 by the acts 6 and 7 Will. IV. c. 85, 86, which have been since amended by subsequent acts. The head of the office is the Registrar-general. Every poor-law union throughout the country was subdivided into districts for the purposes of the acts. In each district, a registrar, locally resident, is appointed, and a superintendent registrar is put over these.—1. As regards *Births*, it is the duty of the registrar to inform himself of every birth that takes place in his district, and to record the particulars without fee or reward, except such as the act authorizes him to take. The forms of the register-books are all settled by the act of parliament, and include a statement of the date of birth, name (if any), sex; name and surname of the father, and name and maiden surname of the mother; rank and profession of the father; signature, description, and residence of the informant; date of registration; signature of the registrar; and baptismal name of child, if added after registration.

Up till 1875, registration was not compulsory on the relatives and others acquainted with the event; but by the Births and Deaths Registration Act, 1874, it is the duty of the parents, or, failing them, of the occupier of the house where the child is born, and of each person present at the birth, to give notice to the registrar within forty-two days after the birth. No fee is required in such cases. But after forty-two days, and within three months, the father or guardian, or a person present, may make solemn affirmation, and on paying a fee of 7s. 6d., obtain a registration. After the expiration of three months, special formalities are required, save in the case of children born at sea. The person who finds a child exposed must give notice within seven days. The penalty for knowingly causing a birth to be registered otherwise than is provided by the acts, is £50. No entry made more than six months after the event (save for children born at sea), will be received as legal evidence.

2. *Marriages*.—with regard to marriages which are performed in the Established Church, every officiating clergyman is required, immediately after the office of matrimony solemnized by him, to register in duplicate the marriage according to a form prescribed by the statute, and one of the duplicates is to be forwarded to the superintendent registrar. The form states the date of marriage; the name and surname of each of the parties; the age as to minority; condition as to previous marriage; rank or profession; residence of each at the time of the marriage; and the name, surname, and rank or profession of the father of each of the parties. Every marriage in England which does not take place in a parish church or chapel of the Established Church, must take place either in a registered building—and most of the chapels or dissenters are so registered—or in the office of the superintendent-registrar. In the two latter cases, it is necessary that the registrar be present in the registered building at the time, or that the superintendent-registrar be present in his office at the time with witnesses. In such cases, the registrar or superintendent-registrar himself registers the marriage so celebrated.

3. As to *Deaths*, every registrar is required to inform himself carefully of every death within his district, and he is bound to enter the particulars in the form required by statute. The form contains a statement of the date of death, name and surname, sex, age, rank or profession, cause of death, name, and residence of the informant, and date of registration. It is the duty of the relatives, or, failing them, of those present at the death, of the occupiers and inmates of the house where the death took place, to give notice within five days after the death. No fee requires to be paid. Four times every year, the district-registrar sends a certified copy of all the deaths to the superintendent-registrar, and when the book is filled, he sends the book itself. These are sent on to the General Register House in London.

The registers of births, marriages, and deaths for England are now kept in London at Somerset House. Besides the registers kept since the passing of the act in 1836, many of the older registers have been collected, and put under the care of the Registrar-general. Indexes are kept of all the certified copies of the registers, and every person is entitled on payment of a fee, to search them, and have a certified copy. For a general search of all these indexes, a fee of 20s. is paid; for a search of a particular index, 1s. is paid, and 2s. 6d. for a certified copy. This certified copy is sealed with the seal of the office, and is evidence in all courts. During the time the register is in the hand of the superintendent-registrar, he is bound also to keep an index, charging a fee of 5s. for a general search, and 1s. for a particular search.

In Ireland, the system of registration of births, deaths, and marriages was introduced in 1863. By the statute 26 and 27 Vict. c. 11, a statute passed relating to births and deaths, a General Register-office was provided in Dublin, and a registrar-general appointed. The country was subdivided into districts. The

provisions of the English act are imitated, except that parents and occupiers of houses are bound to furnish the information of births within three months. A penalty of 20s. is incurred by parents, occupiers, or persons present, who neglect to give notice of the births and deaths; but the penalty is not incurred if the omission was accidental or not wilful. By a statute of the same year (26 and 27 Vict. c. 27), the minister neglecting or refusing to register a marriage, is liable to a penalty of £40; and in other cases, the registrar is bound to register it. By 26 and 27 Vict. c. 90, a like provision is made for a general register of marriages.

In Scotland, a system of registration of births, marriages, and deaths was introduced in 1854, by the Act 17 and 18 Vict. c. 80; later acts are 18 and 19 Vict. c. 29, and 23 and 24 Vict. c. 85. A registrar-general and a general registry-office for Scotland are provided in Edinburgh (at the Register House); the parochial board of each parish appointing the parish registrar, subject to the sheriff altering or combining districts. Owing to the difficulty of discovering regular and irregular marriages, detailed provisions are required, and the husband, or, in default, the wife, is, under a penalty of £10, bound to send the particulars. Registration is compulsory; the notice of births must be given within twenty-one days, deaths within eight days, and marriages within three days.

REGISTRATION OF DEEDS AND WRITS, in the law of Scotland, is an important feature of the administration of the law. The general registration is authorized either by virtue of a clause of registration inserted in a particular deed, or under the old act of parliament of 1698, c. 4, which applies to all probative writs whatever. The clause of registration arose from the practice of churchmen drawing the enforcement of ordinary contracts within their jurisdiction, by causing the parties to consent that the court should, as it were, execute diligence at once if the obligation were not fulfilled. The clause used to be in the form of an authority given to a procurator to go before a judge, and consent to a decree in terms of the obligation; but it is now enough to use this form: 'I consent to the registration hereof for preservation (or for preservation and execution).' Hence, when money is not paid at the time appointed, diligence issues at once on application of the creditor for execution. The practice is now almost universal to insert a clause of registration in deeds stipulating for money payment, especially bonds. When there is a clause of registration, the principal deed is retained in the register, and an attested copy or extract authenticated by the clerk, and authorizing diligence, is given out, and a copy of the deed is entered in a book. When the deed has no clause of registration, it is recorded as a probative writ only, and the principal deed is marked by the clerk, and returned with a certified copy, a copy being also kept in the record. The registration, under authority of a clause of registration, is called a registration for execution, and is in effect a short cut to a judgment without the formality of an action, and the registration may take place after the death of the creditor as well as of the debtor. The other registration is usually called a registration for preservation, the object being merely safe custody; but the extract or copy kept in the register is allowed to be evidence in all cases except where there is an action of improbation to reduce the original deed for forgery. The general register is separate from that of deeds containing clauses of registration, and is applicable to all writs of which it is useful to preserve a copy.

Another class of registers has for its object publication to all the lieges, which is effected by allowing inspection to the public, and these writs are those connected with heritable rights, being used by all who lend money on land, or purchase land. There is under this class (1) a register of sasines—i. e., of the final deeds completing the title to property, and vesting it in the owner; (2), a register of entails—i. e., of deeds which perpetuate the enjoyment of land by a specified class of heirs; (3), a register of interdictions—i. e., by which a proprietor of heritable limits his own power of alienation; (4), a register of adjudications—i. e., transfers by operation of law; (5), a register of inhibitions—i. e., of diligence restraining an owner of land from alienating it to the prejudice of creditors; (6), a register of inventories, by which heirs limit their liability to the amount of their ancestors' assets. By the combined effect of these registers, the state of heritable property, as affected by incumbrances, is displayed to all parties who are interested in ascertaining that fact, and the practice has been found of great benefit to the land-owners of Scotland. Besides the general registers for all Scotland, there were once local registers in every county and burgh for similar purposes; but since 1871 only indexes and abridgments are sent to each county, and the deeds themselves, except in burghs, must be registered in the General Register House in Edinburgh. The general result of the Scotch registration system is, that deeds and all other writings may be registered for preservation either in the central register in Edinburgh, or in the burgh registers; that deeds containing clauses of registration with consent of execution, as well as protests of bills of exchange, may be registered for preservation and

also for execution in the Books of Council and Session, or in the registers of the subordinate courts; and that all deeds, instruments, and proceedings affecting heritable property must be registered, so that any one can ascertain the burdens affecting it, by inspecting the burgh register as to burgage property, and as regards all other property by inspecting the General Register in Edinburgh, where the whole of the general and local deeds can be found concentrated.

At the head of the management of these public registers is the Lord Clerk Register, by whom and by his deputy and officers the details of registration are carried out. The General Register House in Edinburgh, in which are collected all these records, was completed in 1787, a general principle of the management being, that the formation of the records is intrusted to one set of officers, and the safe custody of them to another set, so as to provide a better check on the whole process.

REGIUM DONUM (Lat. royal gift), an annual grant of public money formerly received by the Presbyterian ministers in Ireland. It began in 1672, when Charles II. gave £600 of secret-service money to be distributed annually among the Presbyterian clergy in Ireland, on hearing that they had been loyal to him, and had even suffered on his account. The grant was discontinued in the latter part of the reign of that monarch, as well as in the time of James II., but was renewed by William III. in 1690, who increased it to £1200 a year. It was further augmented in 1723 by George I., in consequence of the Presbyterians having supported the House of Brunswick; raised to £2200 in 1784, and to £5000 in 1793. The amount of the grant for 1863 was £39,746. The grant was at one time shared in by other dissenting ministers, but was latterly confined to the Presbyterian body. The propriety of receiving the Regium Donum was much disputed by those of the same persuasion in England and Scotland. The Regium Donum was withdrawn by the act of 1868, which came into force January 1, 1871, disendowing the Irish Episcopal Church.

REGIUS PROFESSOR, the name given to the professors in the English universities whose chairs were founded by Henry VIII. In the universities of Scotland, those professors are called Regius Professors the patronage of whose chairs is vested in the Crown.

REG'LET, a flat narrow moulding rising equally on both sides. It is used to separate panels, and to form frets, &c.

REGNAULT, HENRI VICTOR, a distinguished recent French chemist and physicist, was born at Aix-la-Chapelle in 1810. While still very young, he was left to provide for himself and his sister, came to Paris, and became a shopman in a bazaar. He made such good use of his scanty leisure, that he qualified himself for admission (in 1830) to the Ecole Polytechnique, and, after the two years' course, came out as a mining engineer. He became a professor in Lyon, whence, in 1840, he was recalled to Paris as a member of the Academy of Sciences, in consequence of some important discoveries in organic chemistry. Having filled chairs in the Ecole Polytechnique and the Collège de France, he became, in 1864, director of the imperial porcelain manufactory at Sèvres.

He was distinguished for extreme skill and patience in experimental work, more than for brilliance or novelty in discovery; and devoted himself especially to the determination of important physical data, such as the laws of expansion of gases, the measurement of temperature, latent and specific heats, &c. His greatest work is that on the numerical data bearing on the working of steam-engines, for which the Royal Society of London awarded him their Rumford medal. He also received the Copley medal (1869) of the Royal Society, and was one of the foreign members. In addition to numerous papers in the *Annales de Chimie*, &c., he published a *Cours Élémentaire de Chimie* (4 vols., 14th ed. 1871). He died in Jan. 1878.

REGRA'TING. See **ENGROSSING**.

RE'GULA, a band under a Triglyph (q. v.) in the Doric style, or the bands between the canals of the triglyphs.

REGULAR CANONS (Lat. *Canonici Regulares*, canons bound by rule), the name given, after the reform introduced into the system of cathedral clergy in the 11th c., to the members of those canonical bodies which adopted that reform. They were thus distinguished from the so-called 'secular canons,' who continued exempt from rule, and who are represented down to modern times by the canons, prebendaries, and other members of cathedral chapters, in those churches, in which the full cathedral system of the Roman Catholic Church is maintained. The rules of the regular canons being variously modified in different countries and ages, a variety of religious orders arose therefrom, Augustinians, Premonstratensians, &c. See **CANONS**, **AUGUSTINES**.

REGULAR PLANE FIGURES are those surfaces whose perimeters are equilateral and equiangular polygons. They are named according to the number of sides which compose the perimeter, being triangles, squares, pentagons, hexagons, &c., ac-

cording as they have 3, 4, 5, 6, &c. sides respectively; and to all except the *Square* (q. v.) the prefix 'regular' or 'equilateral and equiangular' is applied, to distinguish them from other plane figures which have an equal number of sides, but have not all the sides and angles equal. Circles can be inscribed in and described about all regular figures. See **POLYGONS**. *Regular bodies, solids, or polyhedrons* are those solids whose sides are plane figures, all the plane figures being equal, similar and regular. The number of such bodies is necessarily very limited; in fact, no more than five such bodies are possible. They are the tetrahedron, hexahedron or cube, octahedron, dodecahedron, and icosahedron. The sides or faces of the first, third, and fifth of these solids are equilateral triangles; those of the second are squares; and those of the fourth are regular pentagons. From these five regular solids having been treated of, or described by Plato, they are generally known as the Platonic bodies, or Plato's five solids.

REGULARS, REGULAR CLERGY (Lat. *regulares*, from *regula*, 'persons bound by rule'), a name used to designate that portion of the clergy, in the Catholic Church, who belong to the monastic orders or religious congregations, and thus live under an established rule, commonly including the three vows of poverty, chastity, and obedience. The name Regular is employed in contradistinction to 'secular,' the term applied to the clergy who are employed in the ordinary parochial duties, or at least who are not withdrawn from liability to such duties, by being subject to any religious rules or constitutions. The name, therefore, comprises all friars, monks, regular canons, clerks of the missions, and, in general, all members of clerical congregations who live under an approved rule.

REGULATIONS, MILITARY AND NAVAL, are the official codes of rules for the guidance of officers in all the cases where uniformity of practice is requisite, and which cannot rightly be left to individual discretion. Regulations may be divided into three classes: viz., those affecting drill, discipline, and finance. Of the first class are such as cavalry regulations, infantry field manual, naval gun drill, &c. Of the second are the Army Discipline and Regulation Act, and Queen's Regulations (q. v.). The third class are represented by the War-office regulations, purveyors' regulations, explanatory directions for paymasters, navy paymasters' regulations, &c. All these are continually supplemented and altered by circulars.

REG'GULUS. See **GOLDEN-CRESTED WREN**.

REGULUS, a term in Metallurgy, which is now used in a generic sense for metals in different stages of purity, but which still retain, to a greater or less extent, the impurities they contained in the state of ore. When, for example, the ore known as the sulphuret of copper is smelted, the product of the different furnaces through which it passes is called regulus until it is nearly pure copper. The name, which signifies 'little king,' was first given by the alchemists to the metal antimony, on account of its power to render gold brittle.

REGULUS, MARCUS ATILIUS, a favorite hero with the Roman writers, was consul for the first time 267 B.C., and for his successes against the Sallentini, obtained the honor of a triumph. Chosen consul a second time 256 B.C., he was sent along with his colleague L. Manlius Vulso at the head of a navy of 880 ships (with a land army on board) against the Carthaginians, it being the 9th year of the first Punic War, and encountering the enemy's fleet off Heracles Minor, he totally defeated it. The Romans then landed near Clypea, where they established their headquarters, and ravaged the surrounding Carthaginian territory with fire and sword, but Manlius being recalled to Rome with one half of the land forces, R. was left to carry on the war with the remainder. For some time he was victorious in every encounter, but at last (225 B.C.) suffered a total defeat; 80,000 Romans were left dead on the field, about 2000 fled and took shelter in Clypea, and R. with 500 more was taken prisoner. R. remained in captivity for five years, but when fresh reverses induced the Carthaginians to solicit peace, R. was released on parole and sent to Rome in company with the Punic envoys. The rest of his history is one of the most favorite of Roman tales. It is related, *con amore*, by the Roman poets and historians, as an instance and a model of the most supreme heroism, how R. at first refused to enter Rome since he was no longer a citizen; how, after this conscientious scruple was overcome, he declined to give his opinion in the Senate, till that illustrious body laid upon him its commands to do so; how he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners (though no reason appears why such an exchange should not have been effected); and how, after he had succeeded by his earnest appeals, in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and refusing even to see his family, returned with the ambassadors to Carthage, where the rulers, maddened by the failure of their

schemes through his instrumentality, put him to death by the most horrible tortures.

The common story is that he was placed in a cask or chest stuck full of nails with the points projecting inwards, and rolled about till he expired; and on the news of this event reaching Rome retaliations equally atrocious were committed on two of the noblest Carthaginian prisoners. Unfortunately this noble instance of heroic patriotism and unflinching fortitude has not even been noticed by Polybius (about 200 B.C.), who details at great length the other achievements of R.; and Palmerius (Paulmier de Greutesmesnil) and Beaufort, two eminent historical critics, have adduced strong reasons for the story being merely invented for the purpose of excusing the horrible treatment of the captive Carthaginians. Niebuhr roundly declares it to be a forgery, and believes that R. died a natural death; though, excepting the silence of Polybius (which would be utterly unaccountable on the supposition of the mode of his death being the same or similar to what is stated in the common account), there appears to be no reason to doubt the statement in which all the other Roman historians agree, that he was put to death by the Carthaginians.

REGUR, the native name for the cotton-soil of India. It is a rich darkish loam, which has yielded a constant succession of crops—one of cotton, and two of corn—for twenty centuries. It covers extensive level tracts in the southern peninsula, varying from 3 to 20 feet in thickness.

RÊI, REE, or REA, the nominal unit of account in Portugal and Brazil, but no longer existing as a coin; multiples of it, however, still form the authorized coinage in both countries. In Portugal, copper pieces of 5, 10, and 20 (*vintem* = 1*d.* nearly) reis, silver coins equivalent in value to 50, 100 (*testoon*), 200, 480 (*crúzado novo*), 500, and 1000 (*milreis*) reis, and gold pieces of 1000, 2000, 4000 (*moeda douro*), 5000, 6400, 10,000 (gold crown), and 12,800 (*dolra*) reis, are the current coin of the realm; but accounts are kept almost exclusively in milreis and reis. The milrei in Brazil is, however, only equivalent to about 2*s.* 8*d.* sterling; while that of Portugal is fully twice this value, the exchange at present being about 4*s.* 7*d.* sterling. Gold and silver coins have almost disappeared in Brazil, the circulating medium consisting of notes of a milrei and upwards, together with copper and bronze coins.

REI'CHENBACH, a flourishing manufacturing town of Saxony, 11 miles south-west of Zwickau. It contains several wool and cotton mills, stoneware and other factories; and produces extensively woollen fabrics, leather, nankeens, lace dresses, damask napkins, waistcoatings, and hosiery. The greater part of the machinery in the town and vicinity is driven by steam. Pop. (1880) 16,509.

REICHENBACH, a town of Prussian Silesia, on the right bank of the Peilbach, romantically situated at the foot of the Eulen Mountains, 46 miles by railway south-east of Liegnitz. It contains six cotton factories, and carries on linen and woollen manufactures, yarn bleaching, dyeing, and printing. Pop. (1871) 6938; (1880) 7355.

REICHENBACH, KARL, BARON VON, a German naturalist and technologist, was born at Stuttgart, the capital of Württemberg, 12th February 1788, and educated at Tübingen, where he received the degree of Ph.D. Soon after he conceived the project of founding a new German state in the South Sea, but his plans were watched by the French authorities, and being suspected to have some hidden political significance, their author was arrested and imprisoned for some time in the fortress of Hohenasperg. On his release he turned his attention to the natural sciences, and their application to the industrial arts, visiting the principal manufacturing of Germany and France, and on his return he established at Villingen and Hausach kilns for the production of wood-charcoal.

In 1821, in connection with Hugh, Count of Salm, he commenced a number of manufactories of different kinds at Blansko in Moravia, which were carried on under his own superintendence. R.'s management was so economical and effective, that the concern soon became extremely profitable; and R., after a few years, was the possessor of a handsome fortune, which he invested in the purchase of large estates, including the château of Reisenberg, where he kept his magnificent collection of meteorites; and he was about the same time created a baron by the king of Württemberg.

R.'s position as manager of the works at Blansko afforded him valuable opportunities, which were not neglected, for scientific investigation, and the numerous new facts thus brought to light have been of great value to science and art. From the nature of the works, the objects which chiefly presented themselves to his investigation were the compound products of the distillation of organic substances, and by careful analysis he succeeded in bringing to light a number of compounds of carbon and hydrogen not previously known. Among these were creosote (1833), and paraffin (q. v.). In later years he launched out into specula-

tions of a wholly different character. Studying with enthusiasm the subject of animal magnetism, he discovered, as he thought, a new force in nature. See *Op.* His chief literary works are, *Geologische Mittheilungen aus Mähren* (Vienna, 1834), the first geological monograph published in Austria; *Physikalisch-physiologische Untersuchungen über die dynamide des Magnetismus und der Electricität, und ihre Beziehungen mit der Lebenskraft* (Brunswick, 1847—1849); several other works on 'od'ic force,' published at Stuttgart between 1852 and 1858; several papers in the *Neues Jahrbuch der Chemie und Physik; Kohlerglaube und Afterswissenschaft* (1856), in reply to a work of Karl Vogt; *Aphorismen über Sensibilität und Od* (1866); *Die Odische Lohe* (1867). R. died at Leipzig, Jan. 19, 1869.

REI'CHENBERG, after Prague the largest town in the kingdom of Bohemia, stands in the middle of the most populous and industrious district of the Austrian monarchy, in a romantic valley on the Neisse, 52 miles north-north-east of Prague. Linen, cotton, and woollen fabrics are manufactured extensively, as well as fire-arms, hats, leather, shoes, gold and silver wares, musical instruments, &c. During the Austro-Prussian war of 1866, Prince Frederick Charles had his headquarters at R. Pop. (1880) 28,090.

REI'CHENHALL, a small town of Bavaria, on the Saal, 8 miles south-west of Salzberg. It was almost wholly consumed by fire in 1834, and has been handsomely rebuilt since that time. It is the center of the Bavarian salt works, and in the manufacture of salt, its inhabitants—(1890) 3271 in number—are for the most part employed. Of its 18 salt-springs, which burst forth about 50 feet below the surface of the ground, and to which a spacious shaft has been sunk, some are so strong in the brine as to be fit for boiling at once; but generally speaking, they are subjected to a preliminary evaporating process. The strongest and most abundant spring, containing 24 per cent. of salt, and yielding 3300 cubic feet of water every 24 hours, is perhaps the most copious salt-spring in the world. From it alone about 200,000 cwts. of salt are obtained annually. A brine conduit, 60 miles in length, conveys the water of salt-springs from Berchtesgaden, through R., over mountains nearly 2000 feet high, to Traunstein and Rosenheim, in the vicinity of which abundant timber for fuel is procurable.

REICHSTADT, NAPOLEON, FRANÇOIS CHARLES JOSEPH, DUKE OF, described by the Bonapartists as NAPOLEON II., was the son of the first Napoleon by Maria Louisa of Austria, and was born at Paris, 20th March, 1811. His father's joy at his birth was unbounded. 'C'est un roi de Rome,' he cried to the crowd of congratulators who pressed into his apartments on hearing the news. The infant prince was baptized on the 9th of June, in the cathedral of Notre Dame by Cardinal Fesch. After the reverses of 1814, Napoleon, it will be remembered, abdicated in favor of his son, but the Senate took no notice of Napoleon II., and called Louis XVIII. to occupy the French throne; whereupon Maria Louisa and her child removed to the palace of Schönbrunn, near Vienna, where they remained till the treaty of Vienna had rearranged the affairs of Europe. Maria Louisa then proceeded to take possession of the sovereign duchy of Parma, which had been conferred upon her, while her son continued to reside at the Austrian court with his grandfather Franz I., who was much attached to him. By an imperial patent, dated 22d July, 1818, he was created Duke of R., with the rank of an Austrian prince, and received a liberal education, but never enjoyed robust health, nor exhibited a vigorous intelligence. At the July revolution in 1830, his name was mentioned as a candidate for the French throne, and Talleyrand, it is even believed, proceeded to Vienna for the purpose of advocating his cause, but was coldly received, and the project dropped. Destiny had indeed determined otherwise. The constitution of the poor youth was utterly undermined by laryngeal phthisis, and on the 22d July 1832 he expired at Schönbrunn. His last words, addressed to his mother, were very touching as an expression of almost childish despair, 'Ich gehe unter, meine Mutter, meine Mutter!' He was interred with magnificent pomp in the imperial tomb at Vienna.

REID, THOMAS, was born on the 26th April 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. His mother belonged to the well-known family of the Gregories (q. v.). R. began his education at the parish-school of Kincardine, and at the age of 12 he became a student of Marischal College in Aberdeen. His master in philosophy was Dr. G. Turnbull, one of the earliest representatives of the properly Scottish school. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the philosophy of Newton. In 1736, he left Aberdeen, and went, in company with a friend, to England, where he was introduced to the most distinguished men in Oxford, Cambridge, and London. In the following year, he was presented by the senatus of King's College to the parish-church of New Machar in Aberdeenshire. The parishioners were bitterly opposed to his appointment, but his conduct and manner grad-

nally won them over. It is said that, from distrust of his powers, instead of composing for the pulpit himself, he preached the sermons of the English divines Tillotson and Evans. In 1740, he was married to a cousin of his own, who greatly aided him in the work of his parish. In 1739, Hume's *Treatise on Human Nature* appeared; the perusal of which gave the impulse that determined his future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world.

In 1748, he contributed to the Royal Society of London a short essay on *Quantity*, occasioned by what he considered an abusive application, by Hutcheson, of the forms of mathematical reasoning to ethics. In 1752, he was appointed one of the professors of philosophy in King's College, Aberdeen, the senatus being the patrons of the chair. Here he followed the established course of teaching in three successive years to the same students, mathematics, natural philosophy, and moral philosophy. He took an active part in all the business of the university. He was also the founder of a Literary Society in Aberdeen, which enrolled among its members, Campbell, Beattie, Gerrard, and other men of ability; to this society he submitted his first draft of the *Inquiry into the Human Mind*.

In 1763, he was chosen to succeed Adam Smith as professor of moral philosophy in the university of Glasgow. He was now rescued from the necessity of teaching physical science, and devoted himself thenceforth to metaphysical and mental speculation. In 1764, he published his *Inquiry*. His thirst for general science never left him; at the age of 55, he attended Black's lectures on Heat. He continued in the duties of his chair till 1781, when he retired to devote his remaining strength to the publication of his works on the mind. In 1785, the *Philosophy of the Intellectual Powers* appeared; and in 1788, the *Active Powers*. These treatises must always be looked upon as constituting the first complete and systematic work on the science of the human mind. In 1774, he had contributed his account of Aristotle's logic to Lord Kames's *Sketches*. The publication of the *Active Powers* was the close of his career as an author, although to the end of his life he kept up his bodily and mental vigor, and his interest in science. His only surviving daughter had married the son of Gershom Carmichael (the real founder of the Scottish school of philosophy); she it was that, after the death of his wife in 1792, cared for him in his last years. He was taken ill suddenly in the autumn of 1796, and died on the 7th October. He was under the middle size, but had great muscular strength, and was addicted to exercise in the open air.

R. had many points of resemblance to his great contemporary Kant. Both were occupied up to middle life with mathematical and physical studies; both were roused to metaphysical research by Hume, and each became in his own country the chief of a school whose aim was to deliver philosophy from scepticism, and to do so by resting finally on principles of intuitive, or *a-priori* origin.

R.'s refutation of Berkeley, notwithstanding the powerful support of Hamilton, is now considered by many to be a failure. His own account of the motives that led him to abandon Idealism, proves that he completely misconceived the real drift of that famous speculation.

REI'GATE, a municipal borough and thriving market-town of Surrey, pleasantly situated at the southern base of the North Downs, 25 miles south of London by the South-eastern Railway. From very early times, it was considered a place of strength; and after the conquest, it was granted to the Earls of Warrenne. Of the castle built by these earls, only very slight vestiges remain; but beneath the site are several large vaults or caverns, excavated in the sandstone not earlier than the 13th century. The church is in various styles of architecture—the oldest portions dating from the 12th century. Under its chancel is buried Charles Howard, Earl of Effingham, Elizabeth's Lord High Admiral, and the conqueror of the Spanish Armada. R. formerly returned a member to parliament, but was disfranchised in 1867. Pop. (1871) 15,916; (1881) 18,656.

REIGN OF TERROR, the name given to that period in the history of France when the revolutionary government, under the guidance of Maximilien Robespierre, supported itself by the pure operation of terror, exterminating with the guillotine all the enemies, or supposed enemies, of the democratic dictatorship. In the year 1793, the Convention vested the government in a 'Committee of Public Safety,' a body belonging to the party of the Mountain, and of which Robespierre, Couthon, and St. Just became the triumvirate. This Committee, to which every other authority in the country was subjected, deliberated in secret, and the Convention sanctioned all its decrees. Louis XVI. had already been brought to the scaffold; and on October 16, his queen, Marie Antoinette, after being subjected to every possible indignity, was beheaded; the Princess Elizabeth sharing the same fate

on 10th May 1794. The execution of the Girondists (q. v.) followed, and that of the Duke of Orleans. The guillotine became the only instrument of government: a look or a gesture might excite suspicion, and suspicion was death. The Calendar was remodelled, and all religious rights suppressed. When the power of the Committee had attained its climax, a decree was passed abrogating every delay or usage calculated to protect an accused person; but from that moment a reaction began. A section of the Mountain party was satiated with blood, and had become impatient of the control of Robespierre. On July 28, 1794, he was denounced in the Convention for his barbarities, and his death (see ROBESPIERRE) brought to a close this sanguinary era in French history.

REI'KIAVIK. See ICELAND.

REIMARUS, HERMANN SAMUEL, a German philologist of high eminence was born in 1694 at Hamburg, where his father was Professor at the Johanneum Gymnasium. He visited the universities at Jena and Wittenberg, traveled afterwards in Holland and England, and was, on his return, elected Rector at Wismar, and subsequently Professor of Hebrew and Mathematics at the gymnasium of Hamburg. He died there in 1765. He is the author of the so-called 'Wolfenbüttelsche Fragmente eines Unbekannten,' first published by Lessing in his *Beiträge zur Geschichte und Literatur aus den Schätzen der Wolfenbüttelschen Bibliothek*. These 'Fragments,' up to that time only known in MS. by a few of R.'s most intimate friends, produced the profoundest sensation throughout Germany; since in them, the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. Another work, in the same direction, is his *Vornehmste Wahrheiten der natürlichen Religion*; of a miscellaneous character are his *Primitia Wismariensis*, *De Vita Fabricii*, *Dissertatio de Assessore Synedri Magni*, &c. His edition of *Dio Cassius* is one of the most valuable contributions to classical philology.

REINDEER (*Cervus tarandus* or *Tarandus rangifer*), a species of Deer (q. v.), a native chiefly of the arctic regions; by far the most valuable and important of all the species of deer, and the only one which has been thoroughly domesticated and brought into service by man. It is found wild in Europe, Asia, and America, in Spitzbergen, and in Greenland. It is not, however, a native of Iceland, but was introduced into that island by Governor Thodal in 1770, and soon became thoroughly naturalized; great herds now roaming over the wildest parts of the interior, but approached with difficulty by the hunter, and of little value to the inhabitants. It is not there known as a domestic animal. The R. attains its greatest size in the arctic regions; and in Western Europe it is not found very far to the south of the arctic circle; but in Siberia and in America its range extends much further to the south, almost to the latitude of Quebec in America; and in the west of Asia, along the whole chain of the Ural Mountains, and even to the south of Astrakhan, almost to the Caucasus.

The wild R. of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest size being generally attained in very polar regions. The domesticated R. is never so large as the largest wild ones; but the domesticated R. of Siberia is, like the wild one, much larger than that of Lapland. The R. is very inferior in gracefulness to the stag, and, indeed, to most species of deer, being of a rather heavy appearance, with comparatively short and stout limbs, the withers much elevated as in the elk, and the neck carried almost straight forward. The tail is very short. There is little or no mane, but the hair of the lower parts of the neck is very long and shaggy. Both sexes have long horns, those of the male being larger, and often more than four feet long. They are slender and cylindrical almost to the tip in young animals, but in old ones become palmated there, although still slender and cylindrical at the base; they are more or less branched, and from the base spring one or two branches, comparatively short, but also in old animals much palmated, so that the armature of the head is of a very peculiar appearance. The R. is said to use its horns to remove the snow from the lichens which form great part of its winter food; it also scrapes up the snow with its feet and turns it up with its snout; and by a beautiful provision of nature, the feet, forehead, and nose are protected by a remarkably hard skin. The R. is gregarious, partially migratory—its migrations, however, not being regulated by climate, but by the facility of obtaining food. To the Laplander the R. constitutes the chief part of his wealth; and many Laplanders possess herds of 2000 and upwards, which they feed chiefly in the mountainous tracts in summer, and in the lower grounds in winter.

The flesh is excellent, as is also the milk, which is much used. The skins are used for clothing, tents, and bedding. The hard skin of the face and feet is much valued by the Laplanders for making shoes. The R. is also extremely valuable as a beast of draught, for which purpose it is harnessed to sledges. It is capable of maintaining a speed of nine or ten miles an hour for a long time,

and can easily draw a weight of almost 200 lbs. besides the sledge. It is much employed for this purpose in Siberia as well as in Lapland; but in America, it is merely an object of chase, valued for its flesh, fat, and hide. Among other methods resorted to by the Esquimaux and other Indians for its capture is that of making pits in the snow, covered with a slab of ice, which revolves on its own center when the R. sets foot on it. The flesh and fat are made into Pemican (q. v.), besides being used in a fresh state. A very thick layer of fat lies under the skin of the back of the male. The American R. is called the CARIBOU, and is sometimes regarded as a distinct variety, but the differences are very slight. Although the R. has been found to live for years when brought to Britain, the climate does not seem suitable to it.

The R. suffers grievously during summer from the attacks of various kinds of insects, and particularly of a species of Bot (q. v.), which is sometimes not merely tormenting but destructive.

REINDEER MOSS (*Cladonia rangiferina* or *Cladonia rangiferina*), a lichen of great importance to the Laplanders and other inhabitants of the northernmost regions of Europe and Asia, as forming the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in the arctic regions. It is common in Britain, growing in moors and on mountains. It covers extensive tracts in Lapland and other very northern countries, making them even in summer as white as snow, and often thus occupies the ground in pine forests. When pine forests are destroyed by fire, it soon springs up in its greatest luxuriance. It is a very variable plant, but always consists of a much-branched erect cylindrical tubular thallus, with small perforations in the axils. It attains a height of two inches and upwards. The branches of plants which grow together usually mix very intricately into one mass. The importance of this lichen was first brought into notice by Linnæus in a beautiful passage of his *Flora Lapponica*. The reindeer reach it by scraping with their feet, even when it is covered with very deep snow. It is capable of being used for human food, and was recommended for this purpose in times of dearth by an edict of Gustavus III. of Sweden. Its taste is pleasant, although attended with a slight pungency or acidity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on the Lichenin (q. v.) which it contains.

REINFORCE, FIRST and SECOND, in Guns, are the two sections of the length which come next the breech. The gun is made thicker at these parts, so as to resist more effectually the explosive action of the powder. The thickness of metal is less at the second reinforce than at the first, the powder being considered to have already exerted its greatest disruptive force. This conclusion is, however, open to dispute. The first and second reinforce are shown (with their reinforce rings) at AC, CD in the figure under GUN.

REIS EFFENDI, a title formerly given to an officer of state in the Ottoman empire. He was the Chancellor of the empire, and Minister of Foreign Affairs. His duty in the first-mentioned capacity was to confer with the grand-vizier regarding the orders and instructions to be sent to the different provinces, and regarding the proper decision on any subject affecting the empire, whether internal or external; and in the latter capacity, he had the sole and exclusive charge of the relations of the Porte with foreign courts.

REJOINDER, in English Law, means the pleading of a defendant in answer to a plaintiff's replication. The order of pleading is declaration, plea, replication, rejoinder, surrejoinder, rebuttal, surrebuttal, &c.—each party alternately delivering one of these pleadings.

RELAPSING FEVER is one of the three great species of continued fever common in this country, the two others being typhus and typhoid. Although the disease has been accurately described by several physicians during the last century (since 1739), its present name was given to it only about 1850 by Dr. Jenner. It had previously been vaguely known under the various names of *five-day fever*, *seven-day fever*, *mild yellow fever*, *short fever*, *short relapsing fever*, &c., and has often been confounded with common continued fever. It has attracted special notice since 1843—1844, when there was prevalent in Scotland 'an epidemic fever characterized by the suddenness of its onset, its wide diffusion, its short duration, and its small mortality; by its proneness to relapses, by the frequent occurrence of petechiæ, of something like black vomit, and of yellowness of the skin; by the absence of intestinal ulcers; and by profuse sweatings, whereby the fever seemed to be solved.' This fever was supposed at the time by Alison and other eminent physicians who described it, to have been a new and hitherto unknown pestilence; but Jenner's subsequent researches showed, as has been already mentioned, that in this respect they were in error; epidemics of this kind having previously occurred in Scotland or Ireland (or both simultaneously) in 1736, 1739—1741, 1800—1801, and 1816—1820.

Relapsing fever usually begins suddenly with rigors, a sense of chilliness and frontal headache. Febrile reaction soon sets in; the tongue is coated with a thick moist whitish fur; and the skin is often so yellow as to approach to jaundice (a phenomenon that never occurs in typhus or typhoid fever). By the fifth or sixth day, there is usually delirium. After the above-described symptoms have lasted for a period varying from five to eight days, generally on the seventh day, a sudden change takes place. This change commences with a copious perspiration, which is followed by a rapid falling of the pulse to its healthy rate (or even lower), and the patient appears nearly well. But from the fifth to the eighth day of this seeming convalescence, a sudden relapse occurs, and all the primary symptoms return; these run a rather shorter course than before, and again terminate in sweating and in a second convalescence, which is in most cases permanent. The relapse sometimes, however, occurs three or even four times.

Death is a rare termination of relapsing fever; and when it does occur, it is usually before the seventh day of the disease. No special anatomical lesion is observed in the bodies of those who succumb to this disease, but enlargement of the spleen is by no means uncommon.

The treatment to be adopted is simple. The bowels should be opened at the commencement of the attack by calomel and rhubarb, and if necessary, kept open subsequently with castor-oil or saline aperients. The headache must be encountered by leeches or cupping, if the patient is robust; and by blisters or dry cupping, if he cannot bear the loss of blood. The vomiting is often hard to check: if effervescing draughts fail, it may sometimes be combated by calomel and opium combined in pills.

Its cause is unknown, but it mainly attacks the poor and the ill-housed and ill-fed. Its poison appears to be a specific kind; the phenomena of the fever are very different from those of typhus and typhoid fevers; and patients recovering from these diseases may catch, by contagion, this disease, while patients convalescent from this fever may take typhus or typhoid fever. It has been said to be allied to yellow fever, but it more nearly resembles some form of Remittent Fever (q. v.), on account of the repetition of the rigors after a regular period. (It is thought by some to be a bacterial disease. See GERM-THEORY.)

RELATIVE KEYS, in Music, the keys most nearly related to any key whose scales have the greater number of their notes in common with it. The keys which are most nearly related to a major key, taken as principal, and into which it may most easily pass, are its *dominant*, or fifth above; its *subdominant*, or fifth below—each of which differs from it only by one sharp or one flat—and its *relative minor* key, that is, the key which has the same signature, is in its descending scale the same, the ascending scale differing by two notes. In the same way, the keys most nearly related to a minor key are its *dominant* and *subdominant*, and its *relative major*. Thus the relative keys of C major, as principal key, are G major, F major, and A minor; and the relative keys of A minor are E minor, D minor, and C major. A more remote degree of relationship subsists between a major key and the dominant and subdominant of its relative minor, or between a minor key and the dominant and subdominant of its relative major. A major key is also closely connected with its tonic minor, or the minor key of the same tonic, as the two keys have the tonic, dominant, and subdominant in common.

RELATIVE PRONOUNS differ from personal and other Pronouns (q. v.) in this, that, besides standing for nouns, they at the same time have the power of conjunctions. They join sentences or clauses by relating, or referring back directly, to something just named. The relatives in English are *who*, *which*, and *that*. *What* is used for *that which*, thus embracing both relative and antecedent. In many cases, *who* or *which* can be resolved into a conjunction and a personal pronoun. Ex. 'At last the surgeon was called in, *who* (= and he) straightway amputated the limb.' 'Why consult Charles, *who* (= for, or since he) knows nothing of the matter?' 'Ahab seized the vineyard of Naboth, *which* (= although—it) he had no title to.' In cases where they are not thus resolvable, they introduce sentences or clauses to limit nouns, the relative clause serving the purpose of an adjective. Ex. 'He picked out all the men *who had blue eyes*' (= the blue-eyed). 'The house *which stands* (= situated) half-way up the hill is the most cheerful.'

Who is employed when the reference is to persons, and *which* when it is to inferior animals or things. *That* is applied to both persons and things; but it does not follow that it may be used at pleasure instead of *who* or *which*. Whenever a *who* or *which* is resolvable as above described, the substitution of *that* would alter the meaning; in the last, e.g., of the three examples given, it would make the sentence declare that Ahab seized the particular one of Naboth's vineyards to which he had no title; implying that he had a title to some other vineyard or vineyards of Naboth. It is only when the purpose of the relative clause is to limit or define the thing meant, that *that* is ever applied; and for *this*

purpose, its use is in general preferable to that of *who* or *which*. It is easier and more idiomatic to say: 'All the men that had blue eyes,' than, 'All the men *who*,' &c.; and who would think of saying: 'This is the house *which* Jack built?' Besides, that so employed often avoids ambiguities that would attend *who* or *which*. Ex. 'His conduct surprised his English friends, *who* had not known him long.' This may mean either that his English friends generally were surprised, for the reason that they had not known him long; or that only a portion of them—those, namely, that had not known him long—were offended. If the latter is the meaning intended, it would remove all ambiguity to write: 'His English friends *that* had not known him long.'

The use of the demonstrative *that* as a relative is common to the Teutonic languages, but is unknown in Greek, and Latin, and in the Romanic languages. The relatives proper (and the many derivatives and compounds formed from them) in all the allied languages begin with *k*, or an equivalent of *k* (*q*, *h*, *ho*, *wh*, *v*, *h*). Sans. *kas*, Gr. *kos* or *pos* (*how*), Lat. *quis*, *qui*, Pol. *kto*, Goth. *hwas*, Ger. *wer*, Dan. *hvi* (pron. *vi*), Eng. *who*, *how*, Fr. *qui*, It. *chi*.

The relatives proper are also used (sometimes with a slight variation of form) to ask questions, when they are called Interrogatives.

RELATIVE RANK, in the Army and Navy, signifies the precedence which certain non-combatant officers and others are entitled to take among their combatant brethren; for instance, a controller has the relative rank of major-general, a naval surgeon that of a naval lieutenant, &c. Relative rank carries with it all precedence and advantages attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants, rations of fuel and light (or allowances in their stead), detention, and prize-money. Relative rank does not entitle the holder to salutes from ships or fortresses, nor to the turning out of guards, and, of course, it does not confer any right to command.

The relative rank of the several civil departments is stated under their respective headings; see MEDICAL DEPARTMENT, PURVEYORS, &c. It only remains to show the relative rank of the army and navy:

<i>Navy.</i>	<i>Army.</i>
Admiral of the Fleet.....	rank with Field-marshal.*
Admirals.....	rank " Generals.*
Vice-admirals.....	" " Lieut.-generals.*
Rear-admirals.....	" " Major-generals.*

Midshipmen.....	" " Sub-lieuts.

RELEASE, in English Law, is a discharge of some interest in land, or of some legal right. Thus, where one who is the owner of land gives or transfers his right to another, who has some prior estate in possession, the deed by which this is done is a release. Formerly, it was usual for A to give a lease of land to B, and next day to give a release conveying the rest of the estate to B. The term 'release' is also used as a discharge of all demands or rights of action in reference to a particular matter.

RELEVANCY, in Scotch Law, means the condition of a plea which is well founded in point of law, provided it be true in fact. An objection to the relevancy corresponds in many respects to a demurrer in English law.

RELICS (Gr. *leipsana*, Lat. *reliquia*, remains), the name given in theological and historical nomenclature to what may be in general described as the personal memorials of those among the dead who have been distinguished during life by eminent qualities, especially by sanctifying or by remarkable religious services. Under the same name are classed certain objects which are believed to be memorials of the life of our Lord upon earth, and especially of his passion and death. Such memorials of the distinguished dead have at all times and in all states of society, however rude, been held in honor among men. But the question as to relics is chiefly important in relation to Christian history, in which the name is restricted to a single class of memorials, viz., to objects which derive their value from their connection with our Lord, and with the saints; as, for example, fragments of our Lord's cross or crown of thorns, portions of the dust, the bones, the blood, the instruments of torture, the chains, &c., of the martyrs, the mortal remains, the clothes, the books, and other objects of personal use of the other saints, and even objects to which a cer-

tain indirect sacred interest is given, by their being brought into contact with the direct memorials of the distinguished dead, as by their being placed on the tombs of the martyrs, touched with the relics, or blessed at the shrine or sanctuary of the saints, &c. In all such cases, the motive of religious honor, however differently it arises, is precisely the same, viz., the association of the object which is honored with the personage whose virtues or services are the subject of grateful veneration. The merits of relics, in their theological aspect, are beyond the scope of this publication. We shall confine ourselves to an outline of the history of the veneration of relics, and to an explanation of the conflicting views of the rival Christian communions on the subject.

The very earliest monuments of Christian history contain evidences of the deep and reverential affection with which martyrs of the faith, their mortal remains, and everything connected with their martyrdom, were regarded by their fellow Christians, and for which Catholics profess to find warrant in many passages of the Old and of the New Testament, as Ex. xiii. 19; Deut. xxxiv. 6; 2 Kings xiii. 21, and xxiii. 16—18; Isaiah, xi. 10; Matt. ix. 20—23; Acts v. 12—16, and xix. 11, 12. The contemporary letter of the Church of Smyrna attests this plainly as to the martyrdom of Polycarp; Pontian's *Life of Cyprian* tells of their stealing the martyr's body, and carrying it away by night in holy triumph with lights and torches. At an early period, too, miracles are described as connected with relics. Thus Ambrose (Ep. xxii. 1, 2) tells of a blind man's sight restored by his touching the bodies of the martyrs Gervasius and Protasius; and similar wonders are detailed by Gregory Nazianzen (*Orat.* xvii.), Chrysostom (*In S. Ignatium*, n. 5), Leo the Great (*Serm.* iv. 4); inasmuch that the possession of relics of the martyrs, and even the occasional touching of them, was regarded as a special happiness (Gregory Naz. *Orat.* in *S. Theodorum*), and that not merely individuals, but, according to Theodoret the historian, even cities were content to share with each other portions of the sacred treasure (Theodoret, *Græc. Affectionum Curatio*, disp. viii.). Connected with this feeling, too, is found a belief of a certain sacred efficacy in the presence or the touch of the relics, and especially there is ascribed by Chrysostom, Basil, Theodoret, and other Fathers, to prayers offered before the relics, a virtue in dispelling or warding off sickness, diabolical machinations, and other evils. Hence we find that altars were erected over the tombs of the martyrs, or at least that relics were invariably placed on the altars, wherever erected, inasmuch that the Trullan Council ordered the demolition of all altars in which no relics had been deposited. Far more sacred than the relics of Martyrs, was the cross of our Lord, which was believed to have been discovered at Jerusalem by Helena (q. v.), mother of the Emperor Constantine. Minute portions of the wood were distributed to the principal churches; and Cyril of Jerusalem, within less than a century after the discovery of the cross, describes the precious wood as dispersed throughout the world. It must be added, too, that even at this early period, many abuses and superstitions had crept in, which even the Fathers who admit the worship do not fail to condemn.

The practice of relic-worship, however, and the feeling on which it was founded, were not suffered to pass without a protest. Vigilantius, in a treatise which is now lost, but the tenor of which is learned from his adversary, Jerome, reprobated in the strongest terms the excesses to which it was carried, and indeed the essential principles on which the practice rests. But the protest fell without drawing an echo from the contemporary mind. Vigilantius had so few followers, that were it not for the refutation of his work against relics composed by Jerome, we should have no record of his opposition to the popular view; and it is urged by Catholics, as a proof of the universal acquiescence of the church of the 4th c. in the practice of relic-worship, that in an age remarkable for intellectual activity and for polemical ardor—an age which in 25 years saw nearly 30 councils in the cause of the Pelagian heresy—it was not even found necessary to call a single council to condemn Vigilantius.

The writings of Augustine, of Paulinus of Nola, of Ephrem the Syrian, of Gregory the Great, and others, are full of examples of the miraculous virtue ascribed to relics, and of the variety and the extensive multiplication of sacred memorials of all kinds. Nor was this confined to the orthodox alone; all the different parties in the controversy on the Incarnation agreed with Catholics and with one another on this subject, and even the Iconoclasts, at the very time that they most fiercely repudiated the use of images, admitted without difficulty the veneration of relics.

In the age of the Crusades, a fresh impulse was given to the worship of relics in the West, by the novelty and variety of the sacred objects brought home from the churches of Syria, Asia Minor, and Constantinople by crusaders, by palmers returning from Palestine, and by the Latin conquerors of Constantinople; and it is admitted by the most zealous Catholics, that at this period many false, and perhaps even absurd and ridiculous relics were introduced, and were successfully commended to the veneration of individuals or individual churches in the West; nor do

* According to date of commission.

† Junior of the rank.

they venture to doubt that abuse and superstition found their way side by side with what they regard as the genuine and authorized worship of the church. Nevertheless, with the exception of the Waldenses, Wycliffe, and a few isolated individuals, the practice remained unchallenged till the 16th c., when, in common with many other doctrines and practices of the church of Rome, it was utterly repudiated by the Reformers. Catholics, however, allege that the practice, as sanctioned by the church, has nothing in common with the abuses which form the main ground of the objections alleged by Protestants. The Roman Catholic use of relics, as authorized by the church, is to serve as incentives to faith and piety, by recalling vividly to men's minds the lives, and, as it were, the corporeal presence and the earthly converse of the saints, and thus placing before them, in a more touching manner, the virtues which, in the examples, are held up for men's imitation. The decree of the Council of Trent connects the subject of relic-worship with the general question of saint-worship, and regards the relics of the saints not as possessing intrinsic virtue, but only as instruments 'through which God bestows benefits on men.' See INVOCATION OF SAINTS.

The Greek and other oriental churches, and most of the oriental sects, agree with Roman Catholics in the practice of relic-worship. On the contrary, the Reformed churches, without exception, have rejected the usage as unscriptural, calculated to withdraw from the worship of the one God, and deformed by numerous superstitions. They regard a large proportion of the relics which Roman Catholics worship as false and supposititious, and they specify several, regarding the spuriousness of which even learned Catholics appear to be satisfied. Some relics have been the subject of much controversy among Roman Catholics themselves. See HOLY COAT, HOLY PLACES, LORETTO, PILGRIM. It may be added that the practice of relic-worship forms a notable feature of the Mohammedan usage of pilgrimages. The holy cities of Mecca and Medina, and the celebrated Mosque of Omar at Jerusalem, owe most of their holiness in Mohammedan eyes, to the memorials of the Prophet, and other relics which they contain; and the celebrated *Sanjak-sherif* or Sacred Standard at Constantinople, is believed to be formed of the nether garment of Mohammed. The practice occupies a still more important place in Buddhism (q. v.—See also CEYLON).

RELIEF, in English law, means a payment by a tenant or vassal to a lord, the theory being, according to feudal law, that relief (*releodrum*, Lat. *relevare*), is a restoration of the lands after the wardship or guardianship of the lord has ceased, and the vassal has attained majority.—Relief is also the common term used to denote the pecuniary assistance given under the poor-laws to a pauper.

RELIEF CHURCH. See UNITED PRESBYTERIAN CHURCH.

RELIEVING OFFICER is a person appointed in an English union or large parish to administer relief, or rather to inquire into the title of destitute persons to be relieved by such union or parish. He is appointed by the Board of Guardians, and his duty is to receive all applications for relief, to inquire into the truth of the facts alleged by the paupers as to their place of settlement, their state of health, ability to work, and the state of their family. In discharging this duty, he requires to visit the house where the pauper lives, to relieve cases of urgent necessity, &c., and to keep a list of all these paupers, and enter what is done with them in his book.

RELIEVO. See ALTO-RELIEVO.

RELIGION as an element in the character of a man must be distinguished from religion as a system of beliefs, doctrines, and rites. The former—religion in its psychological aspect, or subjectively considered—is especially in the province of the philosophy of religion; the various forms of faith, historically and objectively treated, constitute the field of comparative religion. But though these branches are to be distinguished, neither can be fairly treated apart from the other; and both are included under the Science of Religion, if science it can as yet be called.

The inquiries which collectively constitute the Philosophy of Religion have been prosecuted most zealously since Kant gave new life to philosophical speculation; but since then, as before, conclusions have widely differed as to what is the essence of religion as a factor in human thought and character. By some, religion has been regarded as identical with morality; others have treated it as mainly, if not solely, intellectual adhesion to a certain body of dogmas; while its emotional nature has seldom wanted assertors.

Kant made religion a moral development, and defined it as 'the recognition of all our duties as divine commands,' as of eternal obligation, and not as merely imposed by authority or custom. Fichte denied the practical character of religion, and identified it, at least in some of his writings, with a higher form of speculative knowledge, 'which makes man clear to himself, and answers the highest questions that can be asked.' Elsewhere in Fichte, it is

the recognition of God as manifested in us. Schleiermacher, one of the greatest names in the history of modern theology and religious speculation, expressly denied that religion was either theoretical knowledge or practical, ethical activity, or any mixture of either, and relegated it to the sphere of feeling, of emotion. His most famous definition, more one-sided than his view of religion ultimately was, made it consist in our consciousness of absolute dependence on something which, though it determines us, we cannot determine in turn. Hegel, protesting vehemently against this view, proclaimed religion to be perfect freedom; and taught that, passing through various stages, it is finally the divine spirit becoming conscious of himself through the finite spirit—again an intellectual process. Comte glorified religion, the religion of humanity, as reverence for and worship of the spirit of mankind. Feuerbach degraded religion to an outcome of self-love and egoism.

Religion, on its subjective side, is doubtless in its essence mainly of the nature of emotion; but it is not merely emotion. In it are combined awe, reverence, hope, fear, love; but these feelings point to an object which in all developed religions is the unseen, the infinite, God. With the feelings cardinal to the existence of religion are accordingly bound up certain beliefs; as to the nature of God, our relation to Him and his relation to the world and history, views of the nature of the soul, of the creation of man, of providence. Also, there are associated with these beliefs modes of worship, or forms of ritual for expressing man's reverence. Thus religion, as piety, faith, connects itself with creed and ritual, and assumes objective shape as a system of doctrine, in adhesion to which multitudes may unite. Beliefs reverently and confidently cherished react on practical life, and become a guide to conduct. Religion, accordingly, influences man as intellectual, ethical, and emotional, and, if really cherished, has a correspondingly deep hold on his life.

Origin and Growth of Religion and Religious Systems.—Religion is as old as human history or human language; and there is good reason for saying that it is universal, though there are and have been individual atheists and communities with little sense of religion. The temperament of certain races renders them more highly susceptible of profound religious impressions than others, and more open to religious impulses, just as some individuals have a deeper fund of religious feeling, of piety, and reverence, than their neighbors.

Most of the great religions profess to have been directly revealed to man by inspiration from God, and are thus miraculously communicated to man, who has only to hear, understand, and obey. Thus man himself contributes nothing to the religious system, which may, however, be revealed to him only by degrees, and be apprehended fully only by the remote descendants of those to whom its first truths were made known. The revelation may be completed within a certain period (as Protestants hold of their faith), or there may be a measure of permanent and progressive revelation (as Catholics believe).

On the other hand, many inquirers seek the origin of religion within man himself; nor is it necessary that those who do so should deny the truth of all religions, or reject belief in an almighty and infinite God. Acceptance of a naturalistic theory of the growth of religion does not by any means imply negation of the supernatural, or the falseness of truths as to God naturally developed. Those who believe their own faith to have been given from on high, will regard all other faiths as merely human developments more or less completely false.

It has been not unusual to regard the very lowest form of religion as the first beginning of any and every religion, or of all religions save that of the theorizer. Thus *fetichism* would be the original root of all or most religions, and be followed by the various forms of polytheism, higher and lower. Nature worship is an earlier form of belief than that in which the gods are regarded as persons with minds, wills, characters, perceptive bodies, more or less like those of men. The richest mythologies belong to the anthropomorphic stage. From some polytheistic creeds, again, monotheistic faiths have sprung. Comte alleges that all knowledge has passed through three stages: one religious or theological, in which unseen causes are regarded as divine; a philosophical stage; and the final or positive one.

Again, careful investigators of old faiths such as Max Müller, not only assert that no religion consists of fetichism only, but hold fetichism to be not a primary, but a degraded form of faith; for there certainly is retrogression in religion at certain times amongst certain peoples, as well as development. Guided by the old Indian faith and its records, Max Müller teaches that religion, which he regards as the faculty for the apprehension of the infinite, was never entirely sensuous. By the use of his senses, man was brought into contact with incalculable powers, and was moved to awe by the non-finite, the infinite. This infinite power it saw first—not in tangible objects, as stones, shells, &c.—but in what he intelligently enough calls semi-tangible, as mountains, trees, rivers; and later, in wholly intangible ob-

jects, as the sky, the stars, the sun, the moon, the dawn. From worshipping such powers of nature, men later came to worship invisible deities, manifesting various powers. Ideas of law, virtue, infinitude, and immortality were awakened. The belief in *Devas*, or single supreme beings, which Müller calls *Henotheism*, led naturally to belief in some one God presiding over the other gods, now no longer regarded as supreme, to *Polytheism*; or to something like *Monotheism*, a belief in one God, excluding the possibility of other gods. In some, the disbelief in the many gods led to atheism; or in others, to Buddhism. This development, Max Müller thinks, is well marked in the thought of India. Amongst other races the growth of belief has doubtless been to a greater or less extent different; but the case of India is, for various reasons, specially suggestive. It is still debated whether the word *religion* is to be derived, with Cicero, from *relegere*, to read again; or with Tertullian, from *religare*, to bind.

The Faiths of the World.—The principal creeds and forms of faith are separately treated in this work; the more important articles are here noted, that the reader may refer for further information. On the non-Christian religions, ancient as well as modern, there are the relevant paragraphs in the articles on Assyria, Egypt, India, Japan, &c.; independent articles—Vedas, Sanskrit Literature, Sikhs, Jains, Zoroaster, Zend Avesta, Parsees; Roman Religion, Greek Religion; Scandinavian Mythology; Buddhism, Confucius; Laou-tsze; Mohammedanism, &c. For Christian systems—Christianity; Roman Catholic Church; Greek Church; Anglo-Catholic Church; Presbyterianism; Lutherans; Church of Scotland; Baptists; Methodists; Universalists; Unitarians; and many other articles referred to in these or suggested by them. The relation to Christianity of Mormons, Shakers, and followers of Joanna Southcott, may be debated. On subjects of religious speculation are the articles on Fetichism, Anthropomorphism, Pantheism, Materialism, Secularism, Myth and Mythology. The numerical relations of the adherents of the several faiths in various countries is indicated, when possible, in the article on each country.

The following table shows approximately the numbers professing the chief faiths of the world:

Buddhists.....	500,000,000
Hindus.....	160,000,000
Mohammedans.....	155,000,000
Confucians.....	80,000,000
Adherents of Shintoism (in Japan).....	14,000,000
Jews.....	7,000,000
Christians—	
Roman Catholics.....	152,000,000
Greek Catholics.....	75,000,000
Other Christians.....	100,000,000
Not included in the above.....	157,000,000
	1,400,000,000

In Great Britain places of meeting for religious worship have been certified to the Registrar-general on behalf of very nearly 170 different sects. The U. S. census of 1880 takes account of the organization of 27 religious bodies. The following table shows the numerical strength of the principal Protestant churches:

Lutherans.....	35,000,000	Universalists.....	650,000
Anglican Church.....	15,000,000	Quakers.....	200,000
Calvinists.....	15,000,000	Unitarians.....	185,000
Methodists.....	5,000,000	Mormons.....	180,000
Presbyterians.....	4,000,000	Moravians.....	150,000
Baptists.....	2,560,000	Swedenborgians.....	12,000
Congregationalists.....	1,500,000

RELIGION, OFFENCES AGAINST. See **BRAWLING IN CHURCHES.** In Scotland, the crime of blasphemy is sometimes described as the crime of treason or lese-majesty against God, which consists in denying His being and attributes, and uttering impious and profane things against God, or the authority of the Holy Scriptures. The crime was more rigorously punished by the old statutes of Scotland than by those of England; but the statute 6 Geo. IV. c. 47 declared it expedient that the punishment should be the same, and enacted accordingly. Profanity is in Scotland treated as an offence lower in degree than blasphemy, and includes profane swearing, which is punishable with a fine by justices of the peace; scoffing at religion, or the public mocking or contempt of religion, which is punishable in the same manner, and the disturbance of public worship. The first statute providing against disturbances of public worship was dated 1551, which inflicted a fine; but a later statute of 1587, added escheat of movables as part of the punishment, and applied the penalty to all cases of raising a fray or disturbance in the kirkyard equally

as in the kirk, to the troubling or dispersing of the people assembled there for religious purposes.

RELIGIOUS TRACT SOCIETY, a Society for the promotion of religion by the publication and circulation of religious tracts and small books. By far the most important Religious Tract Society in the world is that of London, which was founded in 1799. There are now, indeed, numerous Religious Tract Societies in different parts of the world, comparatively limited in their field of operations; this great Society reckoning many of them as its branches and auxiliaries. The advantage likely to accrue to the cause of religious truth by the diffusion of tracts and pamphlets, was thoroughly appreciated at the time of the Reformation, but no society was formed for the purpose. In the 17th c., several traces are found of associations for printing and promoting the sale of religious works, but none of them seems to have existed long, or to have been intended for permanence. The English 'Society for Promoting Knowledge,' founded in 1701, avowed, for one of its objects, 'to disperse, both at home and abroad, Bibles and tracts of religion.' In 1750, a society was formed in England called 'The Society for Promoting Religious Knowledge among the Poor,' not, like the former, confined to the Church of England, but embracing Christians of all denominations, which published many tracts and books; and shortly after, similar societies were founded in Edinburgh and Glasgow, which, however, were of brief existence. The design of the Religious Tract Society originated with Mr. Burder, a minister at Coventry, and amongst its founders were Rowland Hill, Matthew Wilkes, and other ministers eminent in their day. It was founded on occasion of the annual meeting of the London Missionary Society. Its beginnings were humble, but it soon expanded; its income, from sales of publications and contributions of benevolence, including a small balance from the previous year, amounted in 1881 to £198,934; and the total expenditure, in trade and grant departments, to £196,426. In the same year, 664 new publications were issued, 175 of which were tracts; the issue of books, tracts, &c., since the foundation of the Society until 1881, was 2,099,210,520. Its operations have extended over all quarters of the world, and it has issued books and tracts in 140 languages and dialects. It has produced many new works, reprints, and abridgments, and has half-a-dozen thriving periodicals.

Objections are sometimes strongly urged against its mode of operations, as interfering with the natural course of the book-trade, and checking free commercial enterprise; to which it has been always replied, that the diffusion of good and cheap books has increased the demand for them, and that the influence of the Society has been favorable and not unfavorable to the book-trade in general. It is impossible, however, to accept this as any proper answer to the objections in question. For competition in trade is a sacred principle not lightly to be interfered with, and it is sufficient to say that certain members of the general publishing business complain of being encountered by a system of production which leaves them no hope of competing successfully with the Society. That tracts distinctly religious may be rendered a valuable engine of spiritual and social advancement is not to be disputed; and those impressed with the conviction cannot but regret that among the immense mass of tracts issued in Great Britain and the United States, not a few, owing to the exaggerated and mistaken views they present, not only of the facts of life but of the teaching of scripture, are perhaps more calculated to damage than promote the cause they are meant to serve.

RELIQUARY, a case or box to contain relics. They are made of all kinds of materials, such as wood, iron, stone, ivory, silver, &c., and are frequently ornamented with costly jewels. Shrines are of the same description. That of the 'Three Kings,' at Cologne, has jewels valued at £240,000.

REMAINDER is a term much used in the law of England. Thus, if the owner of the fee-simple, or freehold of lands, give them by will or deed to A for life, and after his decease to B and his heirs, the interest of B is called the remainder, because, after deducting A's life estate, all that remains belongs to B. A remainder is distinguished from a reversion in this, that in the latter case, the remainder secures to the owner of the estate himself, and so it is called, in that instance, a reversion instead of a remainder. A contingent remainder is too technical a term to be popularly explained, though it plays an important part in the law of real property in England. It is an estate which may or may not ever become vested or enjoyable.

REMBANG, a residency of Java, has an area of 2650 sq. m. and (Dec. 31, 1878) a pop. of 925,508, including 665 Europeans and 15,402 Chinese. There are extensive forests, containing fine timber, the haunts of wild cattle, swine, and three species of tiger. The products are chiefly coco-nuts, coffee, sugar, tobacco, and cotton. Boat-building, fishing, weaving, making earthenware and paper, gold and silver work, are occupations.—R. the capital, is a seaport. Pop. 12,000. There is a government school an institute for girls, and a Protestant church.

REMBRANDT HERMANSZOOM, commonly called REMBRANDT VAN RHYN, was the son of a miller, Herman Gerritsz van Rhyu, whose house (where the painter was born) and mill were situated on an arm of the Rhine at Leyden. R. was born either on 15th July 1606, or in 1608. The former date rests on the authority of the *Description of Leyden*, published in 1641, by Orlers, burgo-master of that town, under whose custody, along with other registers of the city, were those of the registers of baptism, since lost. The latter date rests on the painter's marriage-certificate, lately discovered, dated 10th June 1634, in which R. is stated to be aged 26, and thus the year of his birth 1608. He attended for a short time the Latin School at Leyden; and after studying art three years under Jacob van Swaneburg, and for a very limited period under Pieter Lastman at Amsterdam, and Jacob Pinas at Haarlem, he returned home, and devoted himself to the study of nature. His works now attracted some attention; and about the year 1630, he was encouraged to establish himself at Amsterdam, where he soon entered on a most successful career, and executed numerous works—portraits, landscapes, historical and *genre* subjects, and those wondrous etchings, numbering above 360, which have served almost as much as his paintings to raise his reputation so high.

R. holds the chief place in the Dutch school; his power and originality are exemplified in almost every branch of art; and as examples of composition, expression, color, and light and shade, his works rank with those of the greatest artists. He had numerous pupils, many of whom, such as Gerard Dow, G. Flinck, F. Bol, N. Maas, P. de Koning, and Vanden Eckhout, were distinguished artists. R. spent his large gains in the indulgence of a taste for works of art, arms, and objects of *vertù*, as is proved by an inventory of his effects, extracted from the registers of the Insolvents' Court at Amsterdam, for he got into difficulties, partly from his expensive habits, and partly on account of claims by the tutors of his son, after the death of his first wife. He married a second time, and left two children; his son Titus, by his first wife, predeceased him. Many interesting matters connected with the history of this great painter have been brought to light, and published so lately as 1853, by Dr. P. Scheltema, Keeper of Records at Amsterdam. The date of the painter's decease was a matter of doubt; but among other documents discovered by this author, the following extract, from the Register of Burials of the city of Amsterdam, proves that he was interred in the Westerkerk (West Church) on 8th October 1669: 'Deynsdach, 8th October 1669, Rembrant van Rijn, Schilder, op de Rosegraacht, teghenover het Doolhof. Laet na 2 Kynders.'—('This day, 8th October 1669 [was buried] Rembrandt van Rhyu, Painter, on the Rosegraacht [Rose-Canal], opposite the Labyrinth. He leaves two children.')

REMIREMONT, a small town of France, in the department of Vosges, stands on the left bank of the Moselle, 17 miles south-east of Epinal. Here, two abbeys, founded in 620, were destroyed in the 10th c., but afterwards rebuilt. Of these, the more important was for lady canoneses. Its abbess was a princess of the empire, and those over whom she presided were all descended from families which had been noble for at least four generations. The remains of the abbey are the finest buildings in the town. In the Mairie is a public library of 8000 vols.; cotton goods, leather, and iron-ware are manufactured. R. is the great mart for the neighboring mountain districts. Pop. (1872) 6014.

REMISSIO INJURIE, in Scotch Law, denotes a forgiveness of an injury, and it is set up in answer to an action of divorce for adultery. Forgiveness implies that the party knew of the injury, and acted as if it had never happened; and it is proved by words or acts, such as cohabitation. In English law, it is called condonation. In Scotch law, remission is an extinguishment of a crime by pardon or by act of parliament, but it does not prevent a private party recovering damages.

REMITTENT FEVER is one of the three varieties of fever arising from malaria or marsh-poison—the two others being Intermittent Fever, or Ague (q. v.), and Yellow Fever. In its milder forms, it scarcely differs from severe intermittent fever; while in its more serious form, it may approximate closely to yellow fever. As the nature of the poison on which it depends is sufficiently noticed in the article MIASMA, we shall at once proceed to describe the most characteristic symptoms. The attack may be either sudden or preceded by languor, chilliness, and a general feeling of *malaria*. Then comes a cold stage, similar to that occurring in ague, and usually of short duration. This is followed by a hot stage, in which the symptoms are commonly far more intense than those exhibited in the worst forms of ague. Giddiness proceeding to delirium is not uncommon, and is a bad symptom; while, in other cases, drowsiness or lethargy is one of the most marked symptoms. There is often great tenderness or pain in the region of the stomach, and vomiting—the vomited matter frequently containing bile or blood. A remission of these symptoms occurs, in mild cases, in six or seven hours; but, in severe cases, the paroxysm may continue for 24 hours or longer.

The remission is sometimes, but not always, accompanied with sweating. The duration of the remission is as varied as that of the paroxysm, varying from two or three to thirty hours, or even longer. The fever then returns with increased severity, and without any cold stage; and then the paroxysms and remissions proceed, most commonly according to no recognizable law, till the case terminates either fatally or in convalescence. In favorable cases, convalescence is usually established in about a week. The severer forms of this fever are often accompanied with more or less jaundice, and hence the disease has received the name of bilious remittent fever. It is also known as jungle fever, lake fever (from its prevalence on the border of the great American lakes); and the African, Bengal, Levant, Walcheren, and other similar local fevers, are merely synonyms of this disease. In England, the disease is very rare; and when it occurs, it is usually mild. The disease is most severe in Southern Asia, Western Africa, Central America, and the West India Islands.

The first object of treatment is to reduce the circulation during the hot stage. This is done by bleeding, followed by a dose of five grains each of calomel and James's powder, and, after an interval of three or four hours, by a sharp cathartic—as, for instance, the ordinary black draught. On the morning of the following day, the remission will probably be more complete, when quinine, either alone or in combination with the purgative mixture, should be freely and repeatedly administered. A mixture of antimonial wine with acetate of potash should also be given every two or three hours, so as to soften the skin, and increase the action of the kidneys. Sir Randal Martin—our highest authority in relation to tropical diseases—has directed attention to the fact, that the patient must be carefully watched during the period of convalescence. A timely removal from all malarious influence, by a change of climate or a sea-voyage, is of the highest importance, and is more likely than any other means to prevent fatal relapses into other forms of fever, or into dysentery, which so frequently occur to our troops at stations where miasmatic influences are rife. Although the above sketch of treatment is applicable in most cases, there are some forms of this fever in which blood-letting cannot be borne; and almost every epidemic fever of this kind requires special modifications of treatment.

The following data, extracted from a table drawn up by Sir Alexander Tulloch, will give some idea of the frequency of this disease and the variations in intensity:

	Period of Observation.	Aggregate Sirength.	Number Attacked.	Died.	Ratio of Deaths to Cases Attacked.
Jamaica	20 years,	51,567	38,393	5114	1 to 8
Gibraltar	19 "	60,269	1,522	423	1 " 3½
Ionian Islands	20 "	70,293	6,934	623	1 " 11
Ceylon	20 "	42,978	4,643	868	1 " 5½
Madras	5 "	31,627	1,139	54	1 " 21
Bengal	5 "	38,136	1,311	89	1 " 14½
W. Africa	18 "	1,843	1,601	739	1 " 2

REMO'NSTRANTS. See ARMINIUS.

RE'MORA, or SUCKING-FISH (*Echeneis*), a genus of fishes which Cuvier placed among the *Discoboli* (q. v.), but which Müller assigns to the order *Anacanthi*, and regards as constituting an entire family, *Echeneidae*. Their chief relation to the *Discoboli*, indeed, is in the possession of a sucker, by which to affix themselves to objects of various kinds; but the sucker itself is very different. The remoras have an elongated body, covered with very small scales; one soft-rayed dorsal fin, situated above the anal fin; the head flattened, and covered with an elongated disc extending back beyond it, which is the sucker; the mouth large, with numerous small recurved teeth on both jaws, the vomer, and the tongue. The sucker-disc exhibits numerous transverse cartilaginous laminae directed backwards, and has a free flexible broad margin. These laminae are formed by modification of the spinous processes of a first dorsal fin. They are moved simultaneously by sets of muscles raising or depressing them, and when they are raised after the margin of the disc has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus, that great weights may be dragged by a R.; whilst it obstinately refuses to let go its hold, and will even submit to be torn in pieces before it does so.

The Common R. of the Mediterranean, and of the ancients, is a small fish, seldom more than eight inches long, of a dusky-brown color. It is found in the Atlantic, and occasionally as far north as the British coast. It is frequently seen among the other fishes following ships, and often attaches itself by its suckers to some other fish, even of a kind that would make haste to devour it if it could be reached—an instance of which once occurred &

the British coast, a R. being taken affixed to a cod—often also to the rudder or bottom of a ship. The ancients imagined that it had power to impede or arrest the course of a ship, a fable which continued to be credited till recent times. Thus, it was alleged, was Anthony's ship detained from getting soon enough into action in the memorable and decisive battle of Actium. Of what use its power of adhesion is to the R., is a matter of mere conjecture. The R. is very palatable. There are about ten known species, some of the tropical ones much larger than the Common Remora. One of them is said, on the authority of Commerson, to be used on the coasts of Mozambique for the curious purpose of catching turtles. A ring is fixed round its tail, with a long cord, and the fish, placed in a vessel of sea-water, is carried out in a boat; the fishermen row gently towards a sleeping turtle, and throw the R. towards it, which seldom fails immediately to affix itself, when the cord is drawn in, and the turtle becomes an easy prey.

REMOULADE, a term in Cookery for a fine kind of salad-dressing, consisting of the yolks of two eggs, boiled hard; flour of mustard, about a teaspoonful, rubbed up with three or four tablespoonfuls of oil; when they are thoroughly incorporated, add two tablespoonfuls of vinegar and a little pepper, and other flavoring materials according to taste. It is much used in making the salad called Mayonnaise.

REMOVAL OF GOODS by a tenant of a house to prevent the landlord distraining or seizing them in payment of rent, is attended with this consequence: if the rent is already due, and not merely current rent, then, if a tenant fraudulently or clandestinely remove the goods from the premises, the landlord may, within 30 days thereafter, take and seize these goods wherever they are found, and sell them, by way of payment of his rent. If the tenant remove the goods the day before the rent becomes due, the landlord cannot so follow the goods. Whoever assists the tenant to remove his goods fraudulently, forfeits to the landlord double the value of the goods removed.

REMOVAL OF PAUPERS, in the law of England, is the technical term applied to the compulsory removal of paupers from a parish in which they have become destitute, to the parish or union settlement, and which, therefore, is bound to maintain them. The right of parochial officers to remove paupers in such circumstances has long been considered as one of doubtful wisdom, and the propriety of continuing it has latterly been much discussed. As the law stands, wherever a person becomes destitute in a parish in which he was not born, or in which he has not acquired a Settlement (q. v.), as it is called, the overseers may apply to a justice of the peace at once to remove him to his own parish. In such a case, notice must be given by the removing parish to the parish of settlement, so that the latter may oppose the proceeding; and this gives rise to frequent litigation, for the point turns on the antecedent history of the pauper, or it may be of the pauper's father or grandfather. The right of removing paupers is as old as 13 Charles II.

At first, it was in the power of the overseers, whenever a poor person came into the parish who was likely to become chargeable, to apply for a warrant to remove him after forty days. But this was thought too great a restriction on the natural liberty of poor persons to go where they like in the hope of bettering themselves, and the power of removal was restricted to cases where they have already become actually destitute, and apply for relief. Even that limitation was thought to be too oppressive on the poor man; and by a statute of 1846, whenever a poor man had lived in any parish, where he had no settlement previously, for five years, it was not allowed to remove him thereafter at all, but the expense of his maintenance fell upon the common fund of the union. By a later statute of 1865, this period was reduced to one year, and he is now irremovable not only if he has lived one year in a parish not his own, but in any one union; so that now the removability of paupers is greatly checked, and made less oppressive.

REMOVING OF TENANTS, in Scotch Law, is the giving up of possession by a tenant after the expiry of his lease or term. There must have been a previous notice to quit, or warning, before a tenant can be compelled to remove, and this notice is forty days before Whitsunday; i. e., before 15th May. If there is no express stipulation in the lease binding the tenant to remove at the end of the lease, then the landlord must give warning, which he does by summons of removing in the Sheriff Court; and if the tenant do not punctually remove, decree of removal may be obtained. If there is a stipulation to remove, then that is equivalent to a decree of removing, and a sheriff-officer, with a written authority from the landlord, can remove the tenant by force. In England, no notice to quit is necessary on either side if the lease was for a definite term; but if it was indefinite, then it is treated as a lease from year to year, and half a year's notice to quit must be given by the landlord. If, however, the tenant wrongfully

refuse to quit, there is in most cases no summary mode of ejecting him, and an action of ejectment is necessary.

REMSCHIED, a manufacturing town of Prussia, occupies a height of 1110 feet above sea-level, in the government of Düsseldorf, and 18 miles east-south-east of the city of that name. Originally a villa, it was in possession of a church as early as 1189. It contained several iron-foundries in 1580, in which pig-iron was worked into bars by hand. Its iron trade and manufactures were advanced by the immigration of numbers of artisan Refugees (q. v.). It carries on extensive manufactures of iron wares, cutlery, &c., which are exported to all parts of the world. Pop. (1871) 22,017; (1880) 30,029.

REMUSAT, CHARLES COMTE DE, a French philosopher and politician, son of Auguste Laurent, Comte de Remusat, a Provençal gentleman of some note, who held various public offices during the first Empire and after the Restoration, was born at Paris, 14th March 1797, and studied with brilliant success at the Lycée Napoléon. He made his political *début* in 1818 as a Doctrinaire journalist, allying himself closely with Guizot, who, he confessed, had exercised a greater influence on the formation of his opinions than any other; but he subsequently withdrew from this connection, and became more independently liberal, though he always remained temperate and prudent in his views. Among his earlier political essays, the most important are *Sur la Responsabilité des Ministres*; *Sur la Liberté de la Presse*; *Sur la Procédure par Jurés en Matière Criminelle* (1820); and *Sur les Amendements à la Loi des Elections* (1820). On the establishment of the *Globe* in 1824, R. became one of its most indefatigable contributors, and his name appears in the list of journalists who signed the protest against the fatal 'ordonnances' of the minister Polignac, which brought about the July revolution.

After 1830, R. entered the French chambers as deputy of Muret in the Haute-Garonne, representing it till 1848. He supported the ministry of Casimir Périer, was for a brief period Under-secretary of State (1836) in that of Comte Molé; and in 1840, when the government passed into the hands of Thiers, R. was made Minister of the Interior, but soon resigned the office. After the flight of Louis Philippe, he continued a member of the Constituent and Legislative Assemblies, and was a warm supporter of the party of order. He was exiled after the *coup d'état* of Louis Napoleon, but subsequently received permission to return to France. He devoted himself to literary and scientific studies, till in August 1871, M. Thiers called him to hold the portfolio of Foreign Affairs, which he retained until 1873. He died June 6, 1875. He was long a well-known contributor to the *Revue des Deux Mondes*. Among his writings are his *Essais de Philosophie* (Paris, 2 vols. 1842); *Abelard* (2 vols. 1845); *Passé et Présent* (2 vols. 1847); *Angleterre au XVIII. Siècle* (1856); *Bacon* (1858); *Hartley* (1874); *Histoire de la Philosophie Anglaise de Bacon à Locke* (1876); and his philosophical drama, *Abelard* (1877).

REMUSAT, JEAN PIERRE ABEL, a distinguished Chinese scholar, was born at Paris, 5th September 1788, studied medicine and took his diploma in 1813; but as early as 1811, had published an *Essai sur la Langue et la Littérature Chinoises*, the fruit of five years' arduous work. In 1813, the conscription seized him, but, instead of being compelled to serve as a common soldier, he was appointed assistant-surgeon in the Paris military hospitals, and was subsequently entrusted with the charge of fever-patients at the hospital Montaigu. In the midst of his arduous and harassing professional duties, he found time to prepare for the press his *Uranographie Mongole*, and *Dissertation sur la Nature Monosyllabique attribuée communément à la Langue Chinoise*. At last, however, the day came when he was at liberty to devote himself entirely to Sinological studies.
